Under no other influence thsn that arising from the presence of gold in large quantities easily obtained could California have acquired eo sudden an increase of population. Its wouderful agricultural capabilities, its genial climate and glorious scenery, might have been the subject of ever recurring praise and song, but, as compared to the power of its gold fields, would hava fallen dead and cold before the people. And tho extraordinary combination of eveuts that resulted in tha rapid absorption of the country by the American people, can he looked on, by the olose thinker, only in awe, and as the determination of Providence for some high destiny, the law of which we must be careful not to violate.

We see across the Pacifio, as far south as the equator as we are north, a conntry that has developed itself as rapidly and as vigorously under similar circumstances; could successful sheep raising and wool growing, alone, have given Australia in 23 years a population of near two million of souls? No, sir, it requires other means to bring sbout that end; in that case, as with California, it was the inducement offered by the gold discovory that made men ambitious to be better off, und took them to these uuknown lands; and without which we would not to-day be inaugurating our decennial Exhibition in the city of San Francisco.

Our decennial Exhibition reminds us thst time is creeping on, but in the time that has passed, the Mechanics' Institute has been doing somo service in the interest of the State, and which it is to be hoped may be but the beginning of the work it will yet do in the cause of progress and civilzation.

It is 18 years since the first Indnstrial Exhibition was held, snd 18 years is a good share of the 25 this State has been in existence as a State; how great or how small a part we of California may take in the programme of coming eveuts depends entirely upon how well we provide for thst future in looking closely after the present in retaining and cultoring the better part of ourselves, and discarding the worse. Let us not flatter our higher self or attempt to deceive purer thought, with the srgument of our relative value as compared with communities we know to be worse, or discouraging hope or faithful effort by depreciating that whicb is good among us, if we would make it better.

San Francisco has had the experience of a century crowded into 27 years, and it would be curious indeed if errors had not occurred, hut their occurrence is no excuse for recurrence, and we should take advantage of our experience by uvoiding these very rocks ou which so many are wretchedly wrecked.

But if you are disposed to take a gloomy view of affairs, and tremble within yourself, through your forebodings of the future of our western city, I pray you visit this Exhibition, and reason with yourself from what you see here; and if you do not find that which will fill your heart with hope, and your hope with confidence, I shall believe that your vision is defective and miud unappreciative.

Admitting the existence of all tbat which is discouraging in its bearing upon the solid moral future of California, the csreful observer cannot have fuiled to discover the strong substratum of materiul better than else where, that exiets below the surfaco of society and on which we will and must huild, in order to raise up a community possessing those qualities that will command attention and respect.

Public sentiment may start from a wrong hypothesis and commit a mistake for a time, bnt it invariably adjuets itself to the truth, and in the end is never wrong.

Industry and faithfullness is always in accord with public sentiment, and without these, no people can flourish any more then can a fruit tree rotten in the core.

San Francisco does not lack this essential quality, although recently there hava been many examples of unfaithfulness thet might meke the community stand aghast. And whether these derelictions are in the higher or humbler walks of life, whether with the day laborer, confidential clerk, or prond merchant, they should receive their full and equal share of jnst retribution. When a mechanic uses inferior aud improper material in his work, for tha purpose of meking a trifle mora profit on the job that has been given to him in good faith, he is as much a swindler and a fraud as the merchaut who spends his creditor's money in illegitimate stock speculations, or the clark who violstes the confidence of his employer.

The best evidence of the material growth of this city is the development, year by year, of many new industries, and the increasiug success of those already established, and as this is our decennial Exhibition it may be appropriate to draw some comparisons between ten years ago and now. For instance: The population of this city ten years ago was 112,700; now it is 230,132. The total assessshle property in San Francisco ten years ago was $80,736,165; to-day it is $264,116,294. In 1864 the average attendance at the public schools was 5,776, or thirty-nine per cent. of the averege enrollment; for 1874 the averege attendance was 19,381, or 96.3 per cent of the average enrollmont. In 1864 5, 2,096 vessels, huving a tonnage of 139,190 tons, arrived in this port; ten years later 4,236 vessels arrived, having a tonnage of 1,625,544 tons. Ten years ago we exported merchandise to the value of $13,271,752 and our exports of merchsndise for last year was $27,441,611. In 1864 our total exports of wine only amounted to $41,931; in 1874 we exported wine to the value of $399,663. Ten years ago California exported 425,221 centals of wheat, valued at $771,963; last yesr, whieh was not one of the best, we exported 8,044,279 centals of wheat, valned at $14,125,541. Which latter item shows thst California has added somathing to the bread of the world, and being sent off by sea, has literally been "cast on the waters" and undoubtedly will bring forth good fruit in due time.

The three leading libraries in this city had in 1864 an aggregate nnmber of 41,620 volumee; they now possess 89,055 volumes I need not say that this fact is strong evidence of the substantial advance of thought and better culture, and is second only to the school statistics given above. If these librariee could be concentrated into one grand, free public library, it would be a still greater source of congratulstion and pride.

But returning again to the actual industries, and taking up the the department of metal working, and that portion of it carried on hy the leading foundries, I have obtained the following facts:

	1864	1874
Number of Foundries from which I have returns	13	19
Number of Hands Employed	835	1,385
Tons of Metal Melted	5,752	17,738
Value of Plant	$ 425,000	$1,290,000
Business Done	1, 823,000	4,204,000

These statistics could be extended until they became tiresome, but sufficient is shown to demonstrate the status of the city of San Francisco of to-day as compared with San Francisco of ten years since; giving evidence that none of her better institutions have decayed during the last decade.

The influence that California has exercised upon the chanuels of the commerce of the world, has been very marked, and will undoubtedly be still more so in the future. The diversion of the tea trade; snpplies to the China Empire; the developing of Japan; the new business relations with Australia, and the establishment of such an important entrepot as San Francisco, are hut a part of the many important obanges so far wrought out.

When California can claim a population equal to that of Ohio, and when San Francisco has 700,000 inhabitants, possessing its own water and gas, having its affairs well administered by faithful officers, and ite institutions of learning and political economy on firm foundations, its influeuce will directly control the trade between Western Europe and Eastern Asia, und through that influence she must have an important bearing on the commerce of the world.

But it is not the influence that San Francisco or California may exeroise on the commerce existing between foreign nations, thst will make her great and prosperous, it must be on interual development, and growth of the natural resources, material industries, and character of the people. What I consider essentisl to the stable prosperity of San Francieco, is to educate the people in the fundamental principles of political economy; to encourage the manufacture of every thing that can be made to advantage here, and it is well to go beyond this, and experiment in those branches of mnnufactures whoee success may seem even doubtful; to offer facilities for trade tuition, and in which so much has been done elsewhere and so little here; to provide rudimental education for all in the fullest sense; to make lszinese abhorrent; to punish unfaithfulnees and peculation, and by the unswerving punishment of offenders, set a high standard for the rising generation; to provide means of intellectual enjoyment for those whose daily labor is their only capital; to extend the influence of free libraries, of free lectures, and of all institutions of culture and lesruing; and not least among these, to periodically gather together, evidence of the industry and the

Averill Chemical Paint,
MANUFACTURED BY THE
Cal. Chemical Paint Co.

PURE WHITE, AND ANY SHADE OR COLOR.

This Paint is prepared in liquid form, READY FOR APPLICATION—requiring no thinner or dryer, and will not spoil by standing any length of time.
It is Cheaper, more durable, more Elastic, and produces a more Beautiful Finish than the best of any other Paint.
It will not Fade, Chalk, Crack, or Peel off, and will last twice as long as any other Paint.
In ordering White, state whether for Outside or Inside use, as we manufacture an Inside White (Flat) for inside use, which will not turn yellow, and produces a finish superior to any other White known.
Put up in ¼, ½, 1, 2 and 5 gallon packages, and in Barrels. Sold by the Gallon.
For further information send for Sample Card and Price List, or apply to the office.

AMMONIA!
For Washing and Cleaning Purposes.

For Sale by all Grocers.

This article is universally used in Europe, and, recently introduced for general family use in San Francisco and neighborhood, is already in great demand. It is now the intention of the manufacturers to introduce it all over the Pacific Coast, at prices which will bring it within the reach of every household.
It is unequalled for cleansing Woolen Fabrics, Cutlery, Carpets or Crockery; for Scrubbing Floors, Washing Paint, Removing Grease Spots, Shampooing or Bathing.
It renders water soft, and imparts a delightful sense of coolness after washing.
DIRECTIONS.—For Laundry, use two to four tablespoonfuls to a washtub of water. For bathing, use one tablespoonful in the bath tub. For removing grease spots, apply with a brush, undiluted, and wash with water afterward. For stimulating the growth of plants, use a few drops in every pint of water used in watering.
PRICE.—Per Pint Bottle, 25 cents; per quart Quart Bottle, 40 cents; per Half Gallon, 75 cents.
Also, SULPHATE OF AMMONIA for chemical purpose, fertilizing, and the preparation of artificial manures. AMMONIACAL PREPARATION, for the prevention and removal of boiler scale. CRUDE AMMONIA, for general manufacturing, and PURE LIQUOR and AQUA AMMONIA for chemical and pharmaceutical purposes.
☞ Manufactured by the

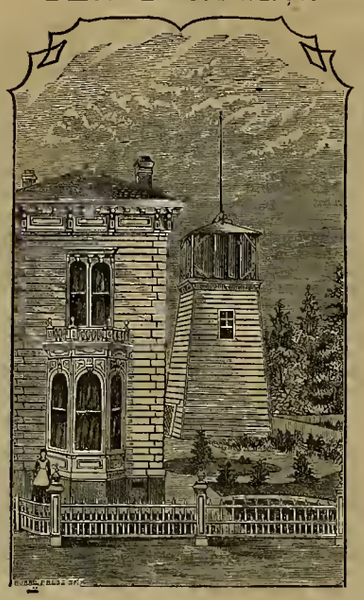
THE TURBINE.



Simplest, Cheapest, and Most Durable.

The Inventor of the Dexter Windmill has made new and useful improvements in Windmills, patented March 16th, 1875, and now feels confident of having the SIMPLEST, CHEAPEST, MOST DURABLE, and
ONLY PERMANENT WINDMILL
IN THE WORLD.

SIMPLEST, because it is less complicated; CHEAPEST, because it never needs repair, standing on a firm foundation; MOST DURABLE, because it is all under cover, and has less rigging to get out of order; ONLY PERMANENT, because the only Windmill in the world that has never been injured by storms. Hundreds of people, who have thought the Dexter perfect, will be glad to observe the SUPERIORITY OF THE TURBINE over all predecessors. Although much improved, the price of mills remain the same as formerly. Persons who study their own interest will investigate the TURBINE before purchasing any other.
Territory for sale outside of California, at reasonable rates and easy terms.
Mills built to order of the best material, and at the shortest notice, by Kimball Manufacturing Company, corner Fourth and Bryant streets, San Francisco. Any orders sent to their address will receive prompt attention.

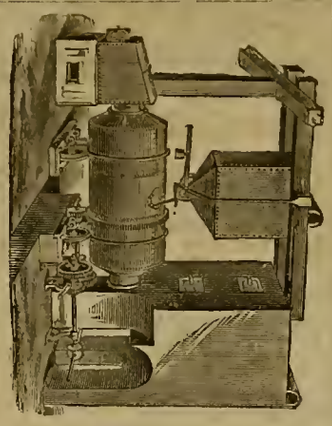
TEATS' PATENT FURNACE.



TEATS' PATENT FURNACE

For Roasting, Desulphurizing, Chloridizing and Oxidizing Ores, etc. For the reduction of Gold, Silver, Lead and other ores, saving a larger percentage, at less cost, than any other invention now in use. Chloridizing Silver ore more thoroughly, in less time, with less fuel, salt and labor; also roasting Lead ore preparatory to smelting, better and cheaper than any other invention. The Furnace is so constructed that one man, of ordinary ability, tends five or more furnaces; controls them with ease; adding heat or air; stopping or starting at will; charging and discharging with ease. Also, Patent "Conveying Cooler," for conveying and cooling roasted ores, heating the water for amalgamation and the boilers at the same time. Saving the large space in mill (covered with brick or iron), and the labor of two men per day, exposed to the poisonous chlorine gases. Also, Patent Air Blast "Dry Kiln," for drying ores direct from the mine or breaker, saving fuel and labor heretofore necessary in drying ores for dry pulverizing. For description refer to MINING AND SCIENTIFIC PRESS, No. 18, October 31, 1874. For particulars address

D. B. MILLER & CO.,

No. 12 West Eighth Street, Cincinnati, Ohio

Circulars, &c., will be furnished, if required.

(Continued from Page 121.)

genins of the people, as we find in these Industrial Exhibitions.

It is a source of gratification that amidst all the excitement of life in California, and the close attention onr people pay to practical affairs of money making, and money losing; there is a satisfactory amount of energetic brain work done in improving and inventing; and California stands seventh in the list, for petents granted, in propartion to its population.

From the report of the Commissioner of Patents for 1874, the totel nnmber of patents granted in the United States was 13,599, of which California received 1,861, or 14 per cent.; Connecticut is ahead of ell other States, having received 668 patents, or 1 to 304 of its population; while Alabame is behind, having 39 petents, or 1 to 25,564 of its population.

There is an average of one patent granted to 2,956 persnns in the United States; and although Californie is doing pretty well in this respect, yet she is beat by Colorado, New York, New Jersey, Rhode Island, Massachusetts and Connecticut. But she has produced many valuable inventions, some of which can be found on exhibition in this building, and let me urge the good citizens of San Francisco to persuade yonng men to come here, with the spirit of enqniry and research, and a determinetion to imprint and fix in their minds, that which will awaken a desire to improve.

A clear brain awaking to an appreciation of the true principles that nnderlay invention, by being bronght in contact with, and surrounded by, snch results as he finds exhibited in this bnilding, oannot fail to draw from them an inspiration that will develop genius, and may impel him in the front ranks of the inventors of the present age.

The lessons of Industrial Exhibitions cnnnot be told in a short address like this, bnt there is one reflection that forces itself on my mind, and thet is this: if such results as you find in these Exhibitions, are produced by the unaided genius of the people, whet would be the results, if some mode of tnition, as adopted by the Germans, Swiss nnd French, bnt adapted to the temper aud need nf our people, was succ cessfully established here; some scheme of trede tuition and professional teaching that the active brain of Jamee Lick has evidently in contemplation? To thie there can be but one conclusion, which ie, that Americau skill aud geniue would occupy the first rank among all civilized nations.

In my recent vieit to Enrope, at the center of English manufactnring, in Manchester, Birmingham, Glescow, and other pleces, Isaw many works, partly, or entirely furnished with meohinery of American invention, nnd nntebly one case in Manchester, where there is a new screw wnrks jnst etarted, and which is fitted up with machinery entirely of American invention and Americen meke; and at the iron furneces, the Banke rotary pnddler and its modification are largely in use; while in the railroad, the Westinghouse air brake hes compelled ite own introduction, and in recent teste between rivel railroad brakes has come off trinmphantly. The Pullman cer, also, has at last forced its way in English railroeds and is admitted by the people there to be a great improvement and luxury.

I remember when on a visit to Europe eight years ago, sewing machines were looked on with horror; to-day the nnmber of eewing mechines made in England is almost incredible; Wheeler and Wilcon, Grove and Beker, and Singer, and other manufacturers have immense works in different parts of Great Britain, turning ont American ideae by wholesale. If these machines could weave a thread of true Americ-an liberty throngh the minds of the people, freeing them ee it hae freed the shackles nf the poor sewing woman, it would indeed oarry out its mission of usefulness and philanthropy.

The introduction there of American invention and ideas, is largely due to the great industriel exhibitions held in London, Paris and Vienna, and to each nf which the United States hae oontributed snmething, but in all cases has been overshadowed by the local industries and interests of the oontrolling nowers.

Next year the netinns of the world will send their contributions to the International Iudustriel Exhibition, that will open in Philadelphia, under the anspices of the General Government, and in commemnration of the nne hundredth anniversery of this nation's birth. It is no ordinary occesion, and to the mechanics, mnnufacturers and people of California, I venture, as a Californien and a mechenio, to appeal to you and your petriotism, to your recnllection of the dark deys of the uetion's birth, when the Declaretion of Independence was proolaimed, and this struggling oonntry merged from a stete of helplessnesss and dependence into thet of relienoe and abeolnte independence; that as your forefathere in 1776 struggled and triumphed in the battle of life end gave this nation a position and an existence, eo you, with that same indomitable spirit and determinatiou, may fight the same battle over again in the struggle for domination in the industries of the world among civilized netions, and trinnph at thie eecond, '67 the ceutenniel of the nation'e birth, on the same battle ground, in the feir city nf Philedelphia.

We are now advancing well into the year 1876, and while the greater pert of the country ie moving in the metter of the hnndredth anniversary of thie nation's birth, California, young California is, reticent, inactive and indifferent.

But California oannot efford to be behind in the rece, with her vitelity, her genius, her resources and good, hard sense, she mnst take that rank among the States represented that belongs to her.

With the seme tact and ability to mold things well and apply them to good use that Celifornia has displayed heretofore, ntilized at the coming Centennial she will stand pre-eminent as a State among States.

Philedelphia, as tho theatre of the nation, will prodnce no ordinary show, no common pegeentry, in 1876; there esch of the leaning nations of the world will throw its sonl in the struggle for mastery, and woe to the nation that fails. All the nations of Europe will meet on common gronnd; the advantage that Paris gives to France, London to England, Vienna to Austrie, will be lost there. Their host will be the youngest among them, and e gient, if his prowess is not weakened by bad council or apathy.

But we misteke our competitors if we think to find weak antagonists. France, England, Germeny, Belgium, produce artificers equal, in every respect, to our own, and to the Centennial Exhibition they will send the best results of their best skill, and will send their most skillful hands and appreciative brains, to find out the best stnff that is in us.

And what if we are disgraced? How much has California done to avert such a disaster, or to render impossible such a result?

Yonr representatives and those of the other States, decided thet in order to meet the outlay necessary for such an undertaking as proposed, the people of the United States ought to contribute twenty-five cents each. Californie's share was $117,000; she has so far contributed about $3.000.

Congress believed that the one hundredth anniversary of the nation's birth would be hailed with joy and enthusiasm by the whole people, and, in antioipation of this event, public getherings and meetings would be held throughout the oountry. Have yon heard of public meetings in California, or of enthusiasm? The general government and the Centennial Commiesioners thought thet when the people of a State in their individnal cnpacity did not take up its quota of subscription, that the State Legislatnre would make some provision to secnre the success of the Centennial Exhibition. The Legislature of California failed to meke any snch provision. If in the race we run behind, let it not be said that California fettered the rnnner instead of giving wings to hie heele.

Surely some decided means shonld be taken to carry our share of this work, and I am sure that if the people of California will take hold of this matter, in the spirit and manner they have done in timee gone by, on similer occasions, all will be well, and California will ocoupy the proud position she ie entitled to.

The managers of this Industrial Exhibition start in with an indebtednese of eome $70,000, $50,000 of which ie owing to public spirited citizens, who lnaned money without interest to erect thie building. In order to remove this indebtedness and to meet the current expensee of the Exhibition, there ehonld be realized about $100,000; whether thie is realized or not depends upon yonr liberality and patronage.

The menagers have endeavored to bring all the deteils of this exhibition up to the standard of those of former fairs, and in that, I think they have not failed; the oollection of machinery is greater than heretofore, and the character of manufactured goods ie superior. The exhibits in the department of fine arts, the arrangement of the garden and many other parte will beer comparison with those of former years.

Although abont 16,000 feet have been added to the exhibiting space, this has been all absorbed, and exhibitors have been reduced in their epecee fully twenty-five per cent., in order to ecoommodate those who desire to enter goods for exhibitiou.

At an early dey the judges of awards will make their examinations for the purpose of awarding the premiume, which will oonsist of gold and silver medels, the society's diplomes end certificates.

No goods can be entered for competition unless they are in place by the 20st inst., except in the department under the auspices of the Wine Growers' Assooiation, where the time for entries for competition is set at September 1st.

The number of exhibitors exceede that of last year thirty per cent., and although, as usual, they are backward in fitting up their etands, a very few deys will bring order out of cheos. It is expected the Exhibition will continne open about forty days, and I do not doubt bnt that every citizen of San Francisco will vieit it et least once, and leave with a feeling of pride in our mechanics and artisans, then whom no city can produce better, and if there is one time more than another, that I rejoice thet I too am a mechenic, it is when I look aronnd this vast buildiug and witness the trinmphs of their skill and genius.

Taken internally, Dr. Pierce'e Componnd Extract of Smert-Weed, or Water Pepper, relievee, almost instantly, pein in etomach or bowels, crampe and spasme. There is nothing that compares with it for Diarrhœa, Dyeentery, Cholera and Cholera Morbus. Ueed externally, it is a valuable liniment for both men and beast. It ie the people'e friend and all should keep it with them, in fact, so conveniently near thet they can put their hand upon it in the dark, if need be. It is sold by all deelers in medicines.

SUNSCRIBERS are requested to examine the printed address on their papers. If mistakee occur *at any time* please report them to this office. The last figures (at the extreme right) represent the year that your subscription is paid to. Next to these the day and month is represented. For instance, your subscription being paid to July 4th, 1876, it would be represented, viz: jul 4 76; or 4|176; or jul 4,76.

A Good Bindsr for $1.50.

Subscribers or this journal can obtain our Patent Elastio Newspaper File Holder and Binder for $1.50—containing gilt title of the paper on the cover. It preserves the papers completely and in such shape that they may he quickly fastened and retained in book form at the end of the volume, and the binder (which is very durable) nsed continuously for subsequent volumess Post paid, 25 cts. extra. It can be nsed for Harper'y Weekly and other papers of similar size. If not entirel. pleased, purchasers may return them witbin 30 days. Just the thing for llbraries and reading roome, and all wbo wish to file the PRESS. lambp

Thanks for Prompt Attention.

STOCKTON, June 26, 1876.

Messrs. Dewey & Co., S. F.:—

I have received the patent for my invention in wagon brakes, which you prosecuted for me; patented May 11, 1875—No. 163,046. Thanks to you for your prompt attention to the case; you will hereafter be my attorneys in such cases. I recommend all inventors on the Pacific coast to give yon a call, which I tbink they will never have any cause to regret. Very truly yours,

GEO. G. BUCKLAND,
Stockton, Cal.

THOUGHTLESSNESS.—Persons sometimes return thei paper, marked "stop this paper." Their name being pasted on the sheet they think that is all we need to be able to cross their namee off. Now that is thonghtlessness. Yonr P. O. addrees is needed as much as your name. We bave thousands of namee arranged only according to locality. Our mailing clerk does not know where everybody lives.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacifio Coast Inventors.

FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIO PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Spenial Dispatoh, Dated Washington D. C., August 17th, 1875.

FOR WEEK ENDING AUGUST 3n, 1875.*

GAME BOARD.—Hervey Darneal, S F., Cal.

FAUCET.—Isaeo Lobree, Antioch, Cal.

STEAM PLOW.—Theodore C. Stark, Vallejo, Cal.

SHELVINO FOR STOVES.—Henry T. Bestor. S. F., Cal.

CANDLESTICK.—John B. Gribble, Grass Valley, Cal.

ROTARY PRESSURE BLOWER.—Wales L. Palmer and Israel W. Knox, S. F., Cal.

BASIN FAUCET.—William C. Bussey, S. F., Cal.

AMALGAMATOR.—Elwin J. Fraser, S. F., Cal.

AUTOMATIC ROTARY CARBURETER.—Thomas A. Stombs, S. F., Cal

———*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issne.

NOTE.—Copies of U. S. and Foreign Patents furniebed by DEWEY & Co., in the shortest time possible (by telegraph or otberwise) at the lowest rates. All patent business for Pacifio coast inventore transacted with perfect secnrity and in the shortest nossible time.

RATES of POSTAGE—Domestic Postage.

SATURDAY, April 3d, 1876.

ON ALL LETTERS throughout the United States, 3 cts. for each half ounce or fraction thereof.

DROP OR LOCAL LETTERS, 2 cte. per half ounce where there ie a free carrier'e delivery; other offices, 1 cent.

POSTAL CARDS, 1 cent., in the United Statee.

VALUABLE LETTERS may be registered by payment of a registration fee of 5 cts. in addition to Postage. Money can be sent with absolute eafety by mail, by procuring a Money Order. The fees are: On orders not exceeding $10, 5 cts.; $10 to $20, 10 cts; $20 to $30, 15 cts.; $30 to $40, 20 cts.; $40 to $50, 25 cte.

PRINTED BOOKS, in one package, to one address, 1 cts. for each 2 ounces or fraction thereof, not over 4 lbs.

ON TRANSIENT NEWSPAPERS, or other Printed Matter (Books excepted), and on Circulars, Pamphlets, Book Manuscripts and Proof Sheets, Maps, Sheet Music, Chromos, Engravings and Photographs, 1 cent for each 1 ounce or fraction thereof, not over 4 lbs.

SEEDS, Cuttings, Bulbs, Etc., 1 cent for 1 ounce and fraction of 1 ounce, not over 4 lbs.

SAMPLES OF MERCHANDISE (Liquide excepted), Ores, Etc., Flexible Patterns, Paper, Envelopes and Blanks, 1 cts. for each 1 ounce, not over 4 pounde.

ALL TRANSIENT MATTER, except duly certified letters of Soldiers and Sailors, must be prepaid by stamps.

☞On matter not above specified, same rate as *Letters*.

Foreign Postage

LETTERS TO GREAT BRITAIN & IRELAND.—For each half ounce, or fraction, 6 cts., if prepaid; if not prepaid 6 cts extra will he collected in Great Britain, and 6 ctsin U. S.

TO THE GERMAN STATES.—For every half ounce, or fraction thereof, via N. German Union direct, 6 cts.; closed mail, via England, 7 cts., prepayment optional.

TO FRANCE (payment compulsory), 10 cts. for each half ounce or fraction thereof, direct mail; 4 cts. (open mail) by England. Fully prepaid, via Eng., one-third ounce, 10 cts.; one-third to one-half ounce, 16 cts.; one-half to two thirds ounce, 20 cts.; two-tbirds to oneounce, 26 cts.

POSTAGE TO CANADA.—On letters, three cents per half ounce or fraction thereof. Must be prepaid. Otherwise letters sent to Dead Letter Office.

Transient printed matter same as the United States.

Patterns and samples of merchandise in packages not exceeding the weigbt of eight ounces may he sent at the rate of ten cents for each sample.

Hints about Advertising.

If you have goods to sell farmere, how much better will it pay you to advertise in a farming paper, closely read by 16,000 intelligent farmers, than in miscellaneous daily or weekly jonrnals with 30,000 readers, comprising only 2,000 farmers. A mining journal in California with 16,000 readers reaches more intelligent minere than any other 10 papers in the Union.

Purchasers are more likely to look for information in the advertising columns of a paper devoted to their special interests, than elsewhere, when ready to buy. Some will not read advertieements upon any other occasion, but seek the best paper when wanted.

If yon happen to be the only advertiser in your line of business in a paper, all the better. But if several firms advertise the same, your own judgment will question whether you can best afford to go unrepreaented.

Weekly journals are read most leisurely and carefully, and at a time when the subscriber is most favorably inclined to examine advertisements. The newspaper most specially representing your particular branch of industry is usually best entitled to your patronage, and the most profitable medium you can employ.

An advertisement in an honest and handsome sheet is favorable to the reputation of the advertiser. The readers of the PRESS are a superior and industrious class, who are able to purchase and who seek to patronize the best and fairest dealing tradesmen.

Advertising in cheap priced mediume (of limited circulation) is like buying goods at retail when yon could as well take them at wholesale.

Information imparted to a list of superior and intelligent, and active, and industrious readers (naturally looked np to by otbers for information), is seed sown in good soil for the advertiser.

Fame and fortune are gained, nine times in ten, by liberal and judicious advertising.

The Large Circulation of the MINING ANN SCIENTIFIC PRESS extends throughout the mining districts of California, Nevada, Utah, Colorado, Arizona, Idaho, Montena, British Colnmbia and to other parts of North and South America. Established in 1860, it has long been the leading Mining Journal of the Continent. Its varied and relieble contents giving it a character popular with both its reading and advertising patrons.

DEWEY & CO.

American & Foreign Patent Agents.

OFFICE, 224 SANSOME STREET, S. F.

PATENTS obtained promptly; Caveate filed expeditiously; Patent reissues taken ont; Assignments made and recorded in legal form; Copies of Patents and Assignments procnred; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belginm, Prussia, Austria, Victoria, Peru, Russia, Spain, British India, Saxony, British Colnmbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cnba, Roman States, Wnrtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Grenada, Chili, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, bnt the drawings and specifications should be prepared with thoronghness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country SOONER) than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more directly judge of the and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of goverment, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valnable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signatnre of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assnred that their communications and business tranеactions will be held strictly confidential by us. Circnlars free.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acqnaintance of all parties connected with inventione and patent right business, believing that the mntual conference of legitimate business and professional men is mntual gain. Parties in doubt in regard to their rights as assignees of patents, or purchasers of patented articles, can often receive advise of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illnstrations of inventions and machinery, for newspaper, hook, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

DEWEY & CO.,

United States and Foreign Patent Agents, publishers Mining and Scientific Press and the Pacific Rural Press, 224 Sansome St., S. F.

Mining and Scientific Press.

Started in 1860, is one of the oldest weekly journals now published in San Francisco. It has been conducted by its present proprietors for ten years, during which period it has been repeatedly enlarged and constantly improved. The active and steadfast efforts of its publishers have gained for its conduct an amount of practical experience greater than any other publishers have accumulated on this coast, of a weekly journal.

The sum paid by us for the best editorial talent obtainable for our special class journal; for engravings, for interesting news and correspondence, and for printing a large-sized, handsome sheet, is unequalled by that of any other American weekly west of the Mississippi.

As a PRACTICAL MINING JOURNAL it has no rival on this Continent.

It is the only MECHANICAL, and the only SCIENTIFIC journal of the Pacific States.

Miners, Assayers, Millman, and Metallurgist in the United States should take it.

Pacific Coast Mechanics, Engineers, Inventors, Manufacturers, Professional Men, and Progressive and Industrial Students should patronize its columns of fresh and valuable information.

Mining Engineers, Superintendents, Metallurgists, Mine Owners and Mine Workers throughout the world should profit by its illustrations and descriptions of New Machinery, Processes, Discoveries and Record of Mining Events.

Intelligent thinkers throughout the land, in high or humble situation, who would avoid literary trash for genuine information, should SUBSCRIBE AT ONCE.

DEWEY & CO.,

No. 224 Sansome street, S. F

Designing and Engraving at This Office.

We are prepared to do fine Wood Engraving for illustrating Landscape Scenery, Buildings, Machnery, Works of Art, Manufactured Articles, Trade Marks, Seals, Etc. We have a first-class

Machine for Engraving

A portion of the work, which can be finished thereby more perfectly than hy the eye and hand alone. Our patrons can depend upon first-class work always, and at reasonable prices. Samples can be seen at our office.

DEWEY & CO.

SECOND EDITION—REVISED AND ENLARGED.

The Explorers', Miners' and Metallurgists' Companion.

Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy.

Containing 672 Pages and 83 Engravings

BY J. S. PHILLIPS, M. E.,

Of California, a Practical Operator for Thirty-four Years; Explorer, and Resident in the Pacific States and Territories for the past Eight Years.

PRICE, bonnd in cloth, $10.50; in leather, $12. Forwarded by mail for 50c. extra, at the MINING AND SCIENTIFIC PRESS Office, by

DEWEY & CO.

Our Agents.

OUR FRIENDS can do much to aid of our paper and the cause of practical knowledge and science, hy assisting Agents in their labors of canvassing, hy lending their influence and encouraging favors. We intend to send none hut worthy men.

D. J. JAMES—Australian Colonies.
JAMES KEARNY—California.
WILSON SPENCER—California.
CHAS. T. BELL—Montana, Utah, Idaho and Nevada

CAMPO, SAN DIEGO CO., CAL., July 3d, 1874.

MESSRS. DEWEY & CO.—*Gentlemen:* To-day I received the patent and other papers of my animal trap, that you so successfully worked through the patent office for me, for which please accept my best wishes. The chances are that I will have another application for you to make for me before long. I am well satisfied with your manner of doing business, and I think inventors of this coast stand in their own light when they do not put their business into your hands.

I remain yours truly, A. M. GASS.

SAN JOSE, Cal., Ang. 10, 1875.

MESSRS. DEWEY & CO—*Dear Sirs:*—I cannot commend too highly your efficiency in securing the patent, and you can depend on me as an assiduous advocate of your agency. With much respect, yours truly,

M. ROSS.

UNITED STATES

Mineral Land Laws, Revised Statutes,

And Instructions and Forms Under the Same.

We have just issued a pamphlet containing the general mineral land laws of the United States, with instructions of the Commissioner of the Land Office The contents of this pamphlet comprise all of the Government laws with relation to mineral lands of interest to the mining community, as follows: Mining Statute of May 10th, 1872, with Instructions hy the Commissioner of the Land Office; Mining Statute of July 26th, 1866; Mining Statute of July 9th, 1870 Forms required under Mining Act of May 10th, 1872, as follows: Notice of Location; Request for Survey; Application for Patent; Proof of Posting Notice and Diagram of the Claim; Proof that Plat and Notice remained Posted on Claim during Time of Publication; Register' Certificate of Posting Notice for Sixty Days; Agreement of Publisher; Proof of Publication; Affidavit of $500 Improvements; Statement and Charge of Fees; Proof of Ownership and Possession in Case of Loss or absence of Mining Records; Affidavit of Citizenship; Certificate that no Suit is Pending; Power of Attorney; Protest and Adverse Claim; Non-Mineral Affidavit; Proof that no Known Veins Exist in a Placer Claim, etc. There is also given the U. S. Coal Land Law and Regulations thereunder. The work comprises thirty pages, and will be sold, post-free, for 50 cents. It should be in the hands of every one having any mining interests. DEWEY & CO.,

Publishers of MINING AND SCIENTIFIC PRESS, S. F.

N. B.—We have also added to the above publication the REVISED STATUTES OF THE UNITED STATES, so far as relates to Mining Laws.

Real Estate Agency,

900 Broadway, OAKLAND,

—BY—

T. B. BIGELOW, E. BIGELOW and WM. K. ROWELL.

Parties seeking homes or looking for property for investment in this rapidly-growing city, noted for its educational and many other advantages, are invited to call on the above agents, who have a large list of very choice improved and unimproved property for sale.

They also deal in FARMING AND GRAZING LANDS and invite correspondence from any who may to wish buy or sell this kind of property.

A STURTEVANT BLOWER

For Sale Cheap.

No. 2—In good order, with or without belting, shaft, pulleys and galvanized air pipe. Enquire at the BREWERY, corners of Fourteenth and Folsom streets, San Francisco.

Every Mechanic

Should have a copy of Brown's

507 MECHANICAL MOVEMENTS,

Illustrated and described.

Inventors, model makers and ameature mechanics and students, will find the work valuable far beyond its cost. Published by DEWEY & Co., Patent Agents and publishers of the Mining and Scientific Press. Price, post paid, $1.

Mining and Other Companies.

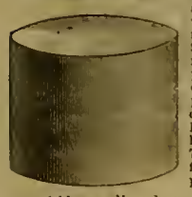
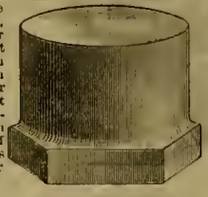
Improved Cast and Forged Steel Shoes and Dies for Quartz Mills.





[PATENTED MAY 26TH, 1874.]

Price Reduced to 16 Cents Per Pound.

San Francisco, November 10th, 1874.

To Supts. of Quartz Mills and Mining Men generally:

We take pleasure in stating that owing to the rapid increase in our orders, our Pittsburg Manufacturers have been compelled to add largely to their works—a new gas furnace and heavier trip hammer—and are thus enabled to reduce the cost of steel and at the same time produce SHOES AND DIES superior to any yet manufactured. We have consequently reduced the price to 16 cents per pound and solicit a trial order, guaranteeing that you will find them at least 10 per cent. cheaper than the best iron. There are no STEEL SHOES AND DIES made excepting under our patent and sold at this office, or by our authorized agents, though certain Eastern manufacturers advertise STEEL SHOES AND DIES which are only cast iron hardened by the addition of a composition. They will not out-wear two sets of common iron, though called steel. They are very brittle and are not capable of being tempered, flying from under the hammer like cast iron. Our STEEL SHOES AND DIES are in use in many of the largest mills on the Pacific Coast, and all who have tried them pronounce them cheaper and far superior to iron in every respect, even at the old price of 20 cents per pound. Their advantages over iron are cheapness on first cost, increased crushing capacity, time saved in changing and in setting tappets, increased value of amalgam by absence of iron dust and chippings, and a saving of 75 per cent. in freight. It takes 50 days to fill orders from the manufactory East. Price 16 cents per pound shipped at San Francisco. Terms liberal.

Address all orders, with dimensions, to W. A. Townsend, Secretary.

POND'S EXTRACT.

THE PEOPLE'S REMEDY FOR INTERNAL AND EXTERNAL USE.

POND'S EXTRACT CURES Piles, blind and bleeding; Inflammations and Ulcerations; Hemorrhage from any organ—Nose, Gums, Lungs, Bowels, Kidneys, Womb, Etc.; Congestions, Enlargements.

POND'S EXTRACT INVALUABLE for Dysentery and Rheumatism; Inflammation of Eyes and Eyelids; Inflammation of Ovaries; Vaginal Leucorrhea; Varicose Veins; Sore Nipples.

POND'S EXTRACT for sale by all first-class druggists, and recommended by all druggists, physicians, and everybody who has ever used it.

Pamphlet containing history and uses mailed free on application, if not found at your druggist's.

POND'S EXTRACT CO.,
New York and London.

TASTELESS MEDICINES.

A prominent New York physician lately complained to DUNDAS DICK & CO. about their Sandalwood Oil Capsules, stating that sometimes they cured miraculously, but that a patient of his had taken them without effect. On being informed that several imitations were sold, he inquired and found his patient had not been taking DUNDAS DICK & CO'S.

What happened to this physician may have happened to others, and DUNDAS DICK & CO. take this method of protecting physicians, druggists and themselves, and preventing Oil of Sandalwood from coming into disrepute.

Phys cians who once prescribe the Capsules will continue to do so, for they contain the pure Oil in the best and cheapest form.

DUNDAS DICK & CO. use more Oil of Sandalwood than all the Wholesale and Retail Druggists and Perfumers in the United States combined, and this is the sole reason why the pure Oil is sold cheaper in their Capsules than in any other form.

Oil of Sandalwood is fast superseding every other remedy, sixty Capsules only being required to insure a safe and certain cure in six or eight days. From no other medicine can this result be had.

DUNDAS DICK & CO'S SOFT CAPSULES solve the problem, long considered by eminent physicians, of how to avoid the nausea and disgust experienced in swallowing, which are well known to detract from, if not destroy, the good effects of many valuable remedies.

Soft Capsules are put up in tin-foil and neat boxes, thirty in each, and are the only Capsules prescribed by physicians.

TASTELESS MEDICINES.—Castor Oil and many other nauseous medicines can be taken easily and safely in DUNDAS DICK & CO'S soft Capsules. No taste No smell

☞ These were the only Capsules admitted to the last Paris Exposition.

SAN FRANCISCO, SATURDAY, AUGUST 28, 1875.

VOLUME XXX Number 9.

Percentage of Gold.

[Written for the PRESS by CHAS. C. RUEGER.]

In an article with the above heading, the MINING AND SCIENTIFIC PRESS, of August 7th, 1875, cites two methods for sampling ore in mills, for the purpose of valuation of the ore crushed and the yield. Both of them have long been in use, and have stood the test of practice, being also recommended by our best authority on the concentration of ores—Peter Vau Rittinger. Neither of the methods, however, can be depended upon as giving a very close average, where the distribution of value in the ore is very irregular. With all good judgment and care on the part of the sampler, the specimens chosen in the one case will not represent the average value of the shovelful, and the pitcherful of pulp will be richer or poorer than the average, according as the ore being fed into the battery at the moment happens to be. In both methods it is assumed that the errors to either side counterbalance each other; which assumption, however, is not always borne out in practice, as those who have taken the trouble to closely test the matter will know.

The following method, which the writer adopted after using both others, is submitted as having given better results, with less trouble. It is hardly necessary to state, that it is only applicable in the wet crushing of ore in a battery, through the finer grades of screens. The modifications necessary to adopt it to the various processes in use, will readily suggest themselves to the experienced millman.

The arrangement used for the purpose is shown in the following sketch:

The pulp on leaving the battery, is run into a wide sluice, *a*, set level transversely and having about ⅛-¾ inch fall to the foot. The current is distributed evenly over the whole width of the sluice, which is easily done by backing up the current somewhat with a gate, *c*, introduced near the head of the sluice, and giving a suitable passage for the pulp beneath its straight under edge.* Towards the lower end of the sluice, three or four feet from the gate, or wherever the current is found to be distributed most evenly, a hole, *d*, is bored through the bottom, midway between the sides. Into this hole a half-inch nipple, *e*, is tightly screwed from underneath. A block of wood, of the shape shown, is fastened in the sluice, below the hole, the end of the slot in the block corresponding with the hole. The screw used for this purpose, should be drawn tight enough to well fit the block to the bottom and yet allow it to be turned. The slotted end of the block being turned towards the current, admits a part of it, which passing down through the hole in the bottom of the sluice, is carried away by means of a hose attached to the nipple, *e*, to a settling tank. In this way, a fractional part of the pulp is continually obtained without trouble, and independent of the care and judgment of anyone. By turning the other end of the block to the current the hole is covered, and the sampling interrupted at pleasure.

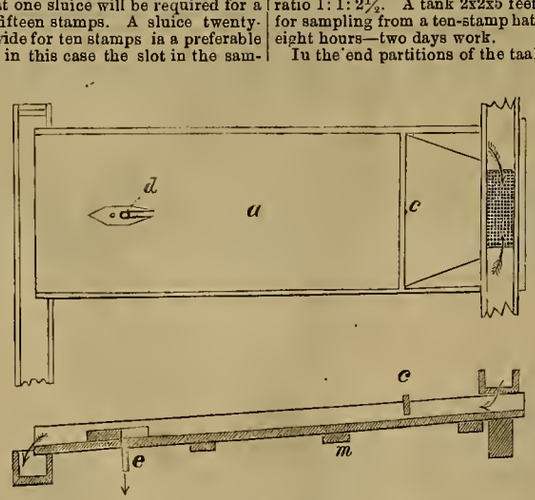
The sands becoming thoroughly mixed in passing away from the stamps, their value will average about the same in the whole width of the sluice, provided the current is evenly distributed and the lodgement of sand in parts of the sluice above the sampling block prevented. It is, therefore, sufficient to intercept only a small part of the pulp current. This can be proven by taking samples from two or more holes, side by side in the sluice, and assaying each separately. Along the sides of the sluice a slight concentrating action takes place, on account of increased friction and counter currents; the sampling holes, therefore, must be kept outside the influence of these.

The bottom of the sluice should be made of one plank, about an inch and a half thick, smooth and straight, and kept so transversely by strong crosspieces, *m*. The sluice must be set level transversely, and admit a slight adjustment with a wedge when in use, in case the even distribution of the current should require it. The width should be from ten to twelve inches for the pulp from five stamps; from this it follows, that one sluice will be required for a maximum of fifteen stamps. A sluice twenty-four inches wide for ten stamps is a preferable arrangement; in this case the slot in the sampling block should have about one-fourth of an inch opening toward the current. The weight of the sample obtained in this case would be about one per cent. of the ore crushed. In sampling smaller quantities of rock, and where greater accuracy is desired, the width of the slot in the sampling block may be increased to three-eighths or one-half inch. Too large a sample is inconvenient to dry and mix.

The sample settling tanks should be deep, and long enough to allow the water to become quite clear before passing out. A capacity of twenty cubic feet for every twenty-five tons of rock to be sampled is sufficient. The width, depth and length are well taken when in the ratio 1:1:2½. A tank 2x2x5 feet answers well for sampling from a ten-stamp battery for forty-eight hours—two days work.

CRYSTAL FALLS, VALLEY OF THE YELLOWSTONE.

In the end partitions of the tanks, a one-half inch hole is made one or one and a half inches below the top edge, for the discharge of the water. The hose carrying the sample pulp is made to discharge into one end of a tank until the sand cone appears at the surface—the water passing out of the hole at the opposite end in the meantime; the hose is then shifted to the other end and the current reversed. When both ends are thus filled with the sample, the pulp is discharged into a similar tank, etc.



Apparatus for Sampling Ores.

The water in the finished tank having settled clear, is drawn off through holes made for the purpose down the centre of a long side of the tank; any slum escaping with the water from the lower holes, must be caught in a suitable vessel, settled, and returned to the sample. The latter having drained off sufficiently, is shoveled out, spread thin on a drying floor, the lumps being broken up with an iron rake When sufficiently dry to shovel over without packing, it is thoroughly mixed, and the sample then reduced; these operations are repeated, until a perfectly dry, and nearly uniform sample of about twenty-five or thirty pounds is obtained. This should all be put through a sieve of about thirty meshes to the linear inch, again thoroughly mixed, and a reduced assay sample of two or three pounds taken from it.

The precaution should be used, to run the pulp on to the sluice through a screen, fine enough to retain all impurities, chips, etc., which might lodge in the slot of the sampling block and so interrupt its action.

The above method of sampling was originated in the course of an investigation of the working results in a California gold quartz mill. The conclusions arrived at thereby, are a fair illustration to your remarks concerning the erroneous opinions had by some millmen, in regard to the results of their work.

In this instance the idea prevailed, that at least ninety per cent. were being saved, since nothing worth while was found in the sand leaving the tail race. Experiments with two lots of rock, of twenty-five tons each, proved a saving of twenty-six per cent. of the gold value in one instance, and of only nineteen and a half per cent. in the other. The work in both trials was the same; the character of the rock, however, was somewhat different. The ore assayed $30 or $36 gold per ton, contained almost exclusively in the sulphurets. The process of extraction therefor was concentration, in sluices. Hendy's concentrators, percussion tables, and carpet sluices, and chlorination of the product. With better arrangements, it is very probable that double the saving could be effected at the same cost.

In a future article, I will give, by way of comparison, an account of the results obtained by concentration on a much less valuable ore than the above, in one of the best of modern washing works.

* Where the fall that can be given is not so considerable, that the current of pulp will be rapid, or where the sands are coarse and heavy, a less simple, but more perfect distributer should be used. For an illustration of such a one I refer to Kustels work on concentration of ores. I refer to the "Happenbrelt" of the Germans.

Montana Scenery.

Among the many beautiful cascades described in Hayden's reports of the Yellowstone country, there are none more picturesque than the Crystal falls, 129 feet high, situated on Cascade creek, a tributary of the Yellowstone river. Dr. Peale, in his report to Professor Hayden, of a trip to the valley of the Yellowstone, says:

Cascade creek flows into the Yellowstone river on the west side between the falls. A short distance above its mouth we find a beautiful fall, or rather cascade, for it is made up of three distinct falls, the aggregate hight of which is 129 feet. The stream, after passing through a deep, gloomy gorge, makes a leap of about twenty-one feet and then falls again in three streams a distance of over fifty feet into a beautiful, rounded basin, in which the water is perfectly clear and quiet. From this basin the final leap is taken and the water flows on to the Yellowstone river.

STOCKTON MACHINE WORKS.—The Globe foundry we recently found doing a thrifty business in the way of local manufacturing and jobbing. Having been long established, this foundry is well suited to do just the kind of work required in a more satisfactory manner than it could be done elsewhere, or by other workmen. John Caine, the proprietor, is now the general agent and manufacturer of the celebrated Root's patent blower on this coast. This blower is being introduced faster than ever before, for mining ventilation especially.

THE fund subscribed in this State by the French residents, for the relief of the sufferers by the floods in Southern France, now aggregates $13,387.

CORRESPONDENCE.

Tasmania.

[From our Australian Correspondent.]

MESSRS. EDITORS:—The last and least of the Australaeian colonies to which I have to refer is Tasmania, a beantiful island situated almost due south of Melhourne, the favorite resort of health and pleasure seekers from the neigbboring colonies. Originally a penal establishment of Great Britain, it still retains a large percentage of the convict element, although principally in the shape of descendants from this savory export of Great Britain. It must uot he forgotten, however, that there is a wide dif ference hetween crimiuals and their children, the latter having no right to suffer for the sins of the former. It should also he horne in mind that at the time when these trensports were supplied hy the old country, people were eent out of their country for their country's good, on very small provocetion, and to speak fairly I think that with the exception of the lower strata, eociety is just about the seme as in other British communities. At all events the place is a beautiful one, whatever opinion you may form of its iuhahitants. Its capitel is Hobart Town, situated on a beantiful site on the banks of the Derwent, a fine wide river, with the land reaching the river's edge in pleasant slopes.

Thie is rather an ancient city—that is for Australia—and it has quite an old-fashioned look ahout it, altbough a comfortable one, withal. The streets are tolerably wide and straight, and the houses nearly all of stone or brick. Here it is that you get in all its freshness a most magnificent fish called the Hobart Town trumpeter; it frequently attains a considerable size, and is equally delicious whether eaten fresh or cured. This heing the capital city, is of course the seat of government, and consequently the Governor's residence, which, although smaller than those of the other colonies, is beautifully situated and tastefully built. Adjecent to the city is the, to us, celebrated Mt. Wellington, the de light of tourists, who seem never tired of scrambling to its top, where there is rather a rough piece of ground consisting of large pieces of rock heaped promiscuously together end playfully termed the plougbed field. From this hight the scenery ie magnificent, and the promise is fulfilled when on the level of ordinary mortals you traverse the districts from thence overlooked. From this city there is a splendid road quite through the island, to what may he termed its northern capital, Launceston, a distance of about 120 miles. This is traversed by coaches, eud the ride through on a tolerably fine day is most eujoyable. Launceston is situated on a low triangular piece of land formed by the confluence of two rivers, the North and South Esk, which after their junction are called by the name of the "Tamar," and hence it is frequently said tbat this city is situated on the Tamar. Ite businese portion is, in my opinion, a miserable situetion; but immediately behind it the land rises in beautiful slopes, and here, where most of the private homes are, the prospect is pleasing and in some parts quite romantic. As a business place, Launceeton is far in advance of Hobart Town, its proximity to Melbourne greatly conducing to this end. After traveling about forty miles down the Tamar you reach the open sea, here called Bass straits, and after twelve hours' steaming you enter Port Philip heads, which I dare eay you are aware is the entrance to Hobson's bay, on the northern extremity of which Melhourne is built From hence Tasmania draws most of its foreign supplies, although a good deal is sent from Sydney as well. Thie island is rich in soil and in mineral's, nevertheless it is a dull, dead-and-alive sort of a place, its people being deficient in that energy which is needful for the development of almost any country, however rich. A railway is now heing built to connect the two principal cities, but its present utility is greatly doubted, whilst no one dreams of its paying for a quaiter of a century or so. Fruit grows here to great perfection, and consequently large quantitiee of jam are made; but in consequence of the want of inter-colonial free trade, there is scarcely any market for it. Railings and shingles are exported in considerable quantities. E. W.

Melbourne, Australia, June 29th, 1875.

MERCHANT MARINE OF THE WORLD.—A paper was recently read before the London Statistical Society giving the number and tonnage of the merchant steamers and sailing vessels of all nations in 1870 and in 1874. The number of sailing vessels in 1870, was 59,918, tonnage 16,042,198; in 1874 the number was 52,289, tonnage 14,523,630. The number of steamers in 1870, was 4,132, tonnage 2,793,432; in 1874 the number was 5,365, tonnage 5,226 888. From which it will be seen tbat the number of sailing veseels throughout the world has decreased, and that there is a very large increaee in steamers, the latter being ninety per cent and the former about ten per cent. At this ratio of increase there would be in 1880 more steam than sail tonnage afloat. The total tounage of the great nations indicate their relative rank as follows: First, Great Britain; second, the United States; third, Sweden and Norway; fourth, Italy; fifth, Germany; sixth, France.

The Black Hills—What Professor Jenney Found There.

The following is a copy of a letter received at the Indian Bureau, at Washington, from Professor Jenney, in charge of the Goverment Geological Expedition to the Black Hills:

CAMP ON SPRING CREEK, BLACK HILLS, DAKOTA, July 31st.—To Hon E. P. Smith, Sir: In my telegraphic dispatch dated July 17th, I briefly informed you of my explorations in that section of the Black Hills north and northeast of Harney's peak. In order to more rapidly explore the Hills, I divided my party; Mr. Newton, geologist, going eouth from French creek, with an astronomer and a photographer to map aud explore the southern portion of the country as far es Cheyenne river; and I, with the assistance of my miners, have prospected the Hills to tbe north, a region hitherto unexplored and unknown.

I Found Gold in Placer Deposits

On hoth Spring and Rapid creeks, from their head-waters to a point where they emerge from the Hills; and more extended prospecting and exploration ehow that in localities in the valleys of these streams, the gravels, especially tbo e of older formation and elevated above the present level of the streams, contain gold in quantities sufficient to yield a fair remuneration for labor economically and skillfully applied, assisted by the proper tools and mechanical appliances, at least a moderate amount of capital, or its equivalent, and such a system of working as the experience of twenty-five years has taught the miners of the Pacific slope to employ.

Fortunately There is an Abundance of Water

In hoth these streams, and in most pleces a rapid current. Spring creek will yield from 300 to 1,000 minere' inches of water, according to season, and Rapid creek at least twice the amount. While the placer deposite as far as discovered are by no means rich or very extensive, compared with those of California, still there is euough precious metal to develop the country, and etock raising and agriculture will do the rest. Among the foothills along the eastern slope of the Black Hills are large gravel deposits, in some places thirty feet thick, often cemented by time into a hard conglomerate, and capping high hills of massive sandstoue Decomposition of this conglomerate has in places yielded the gold which it contained, and which has been washed by heavy rains down the dry gulches, end been caught and concentrated. In the dry gulches in the lower sandstone be is, secondary deposits afford the only crevicing yet found in the Hills, and they may be worked during the spring, while there is water flowing out of the hills in nearly every stream on the toplands, but in summer scarcely a single stream carries its water in an unbroken current to the Cheyenne. They all, except perhaps Rapid creek, siuk in their heds on reaching the foothills. Should these conglomerates be found to contain gold in paying quantities, it will require the employment of capital to work them successfully.

Several Enormous Ledges

Of a mixture of slete, ferruginous quartz, and qnartzite, cross the valleys of Spring and Rapid creeks, extending for miles in a northwestern direction. The oxide of iron contained in ledges has resulted from decomposition of iron pyrites, and specimens of quartz ehow occasionally visible particles of gold, and give, on crushing and panning, a trace of tbe color of the much sought for metal. It is remarkable that so few valuable minerals have been found on the Hills, though the couutry is overrun by miners, and everything in the shape of rock, in any way peculiar in appearance, is brought to me for identification. But I have not yet seen any mineral containing lead, copper, or silver; only iron pyrites, iron ores resulting from its decomposition, mispbickel, graphite, black tourmaline, rose quartz, garnets and stamolide, as mineralogical curiosities. In testing deposits on Spring creek I worked out a particularly rich spot, where an old channel had been cut across by the present bed of the creek, and in ten hours' work with a small sluice,

Obtained Five-Sixths of an Ounce of Gold,

Or about $15.50. Soldiers had previously panned out of the same place not less than two ounces of coarse gold; and on measuring I found the total yield at the rate of four dollare per cubic yard, or about three cents to the pan, as an average for the whole thickuess of the depoeit. It was truly said of this region that there was gold in the very roots of of the grase; but it is not the gold of gravel bars or quartz ledges, not the gold of the miner or geologist, hut the future solid worth of the Black Hills that is to sought in the luxuriant growth of fine grasses that everywhere spread over the beautiful country.

Of the Climate of the Black Hills,

The severity of the winters, the danger of crops heing injured by frosts, and the agricultural products best suited to the soil, I can only judge by examining the flora of the region. Along the eastern slope, where the elevation is from 3,500 to 4,500 feet above the sea, the valleys are filled with a fair growth of bnrr oak, elm, horuheam, hox elder, white hirch, aspen, and hazel. The conspicuous plante are: tiger lily, poison ivy, and Virginia creeper, with grape vines, wild flax, hops and oats; while raspberries, black and red currants, gooseberries, plums, strawberries, and service berries are in places quite abundant. From which I assume that the climate is not severer than that of Maine and New Hampshire, where many of the same plants grow and ripen; and that while the season is not long or hot enough for corn, yet wheat, oats, barley, flax, hope and potatoes would grow there luxuriantly.

The Rain is Quite Remarkable;

Scarcely a day passes without a shower, though perhaps lasting but a few minntes. Heavy rains of long duration only occaeionally occur, but thunder storms are very prevalent, and nnmerous places may he seen all over the Hills showing the marks of lightning. The elevation above the sea makes the climate cool and healthy, while heavy dews and frequent ehowers of rain keep the country carpeted with a luxuriant growth of grass, always green.

WALTER P. JENNEY,
Geological Expedition, Black Hills.

Early Mention of Petroleum.

A full century ago the existence of oil springs in Western Pennsylvania was a published and well established tact. In the *Massachusetts Magazine*, published in 1789, we find the following in reletion to them: "In the northern part of Pennsylvania there is a creek called Oil creek, which empties into the Allegheny river. It issues from a spring, on the top of which floats an oil, similar to that called Barbadoes tar, and from which one may gather several gallous a day. The troops sent to guard the western posts halted at the same spring, collected some of the oil, and hathed their joints with it. This gave them great relief from the rheumatism with which they were afflicted. The water, of which the troops drank freely, operated as a gentle purge.

"There is still earlier evidence of the existence of the oil springs tban this. It ie found in an old book, published in 1772, entitled "Travels in North America," by Peter Kalm. On a map in this volume the exact location of the oil springs are given."

We take this from an exchange; hut it is still far behind. As early as 1629, almost a century and a half before Kalm's hook appeared, a Franciscan missionary, Joseph de la Roche d'Allion, who crossed the Niagara river into what is now New York State, wrote a letter, in which he mentions the oil springs, and gives the Indian name of tbe place, which he explained to mean "There is plenty there." His letter was printed in Sagard's "Histoire dn Canada," in 1632, and subsequently in Le Clerq.—*Nat Oil Journal.*

The Lightning Mail Train.

Arrangements have been perfected hy the Postoffice Department for a lightning mail train from New York to Chicago. The first train will start from New York city at four o'clock on tbe morning of October 1st, and that every morning thereafter, at the same hour, a similar train will take its departure. It will be necessary to start at that hour in order to make connections. No passengers or freight will he taken. The only cars will be mail cars. The run to Niagara Falls will he made without stoppage, at the average speed of forty and a half miles per hour. To the cars will he fitted patent appliances, called "catchere," which will deposit and pick up mail hage at every station without stopping. These catchere are now in use on over 60,000 miles of mail route in the United Statee, and have given the greatest setiefaction, hardly ever failiug to seize the snspended mail bag, no matter how high the rate of speed.

The northern route hae been eelected for the initiatory train in preference to the southern for many reasons. The mail business from New York and New England to the North and West is more than equal to that of the entire country elsewhere. Wisconsin receives and dispatches more lettere than Missouri, and the Northern part of Ohio has more correspondence tban the entire remainder of tbe State. In other words, the northern route is the one of vastly greatest importance to the manufacturing and mercantile communitiee. By means of this arrangement, the Pacific coaet will be placed from twelve to twenty hours nearer the Atlantic seahoerd.

EEL SKIN LACING FOR BELTS.—L. O. Crocker, East Braintree, Mess., writes: "I notice in your May number an article on lacing machine belts. I have heen using for eight years eel skin lacing. I use it for belts from ¼ inch up to 4½ inch. I know that the lacing will last much longer than any I ever used. Perhaps this will he new to some. It is worth trying." —*Leffel's Mechanical News.*

THE loss of steam from condensation in a well protected steam pipe may he taken approximately as 1 lb. of steam per indicated horse power per hour for each 100 feet of steam pipe. In such a case, a stuffing-hox expaneion joint shonld he provided in the steam pipe, allowing an expansion of 2¼ in. for each 100 ft. in length.

AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.—The twenty-fourth annual meet of the American Association for the Advancement of Science opened at Detroit, on Wednesday morniug, August 11th.

A PULLEY 18 feet diameter, 43 inches face, weighing over 12 tons, is no trifling pocket piece. It was made at Fitchburg, Mass., for Akron, Ohio, as part of a 250-horse power engine for a flouring mill.

The Lake Superior Silver Mine Again.

In a late issne of the MINING AND SCIENTIFIC PRESS we gave an extract from the Marquette (Michigan) *Mining Journal* relative to the teet of ores from the Iron river mines. In the *Journal* of August 14th we find a further reference to this euhject. We extract therefrom as follows:

After another season of anxious suspense we are enabled to announce another teet of the Iron river silver veins, the result of which wee even better than wae anticipated hy the most sanguine owners of property in that region. The test was of four and a half tons of ore from the Scranton mine, wbich had to be hauled a distance of nearly five miles over an abominable road, which is mentioned hy way of an explanation of the fact that more rock was not used. The ore or rock was taken at random, and without selection, from a pile of over fifty tone mined nearly two years ago, and from whioh the richest specimens had heen culled by the many persons who have visited the mine, ae was the case with Ontonagon. It is believed, moreover, and not without reason, that the rock loses much of its wealth of silver hy long exposure to the weatber, from the washing and crumhling away of the soft slate rock in wbich most of the native silver is found. The test, however, was a fair one, the quicksilver used heing first purified by straining through buckskin —the members of the Scranton company being determined to arrive es nearly as possible at a true result, and the test heing made more for the information of stockholders, and to determine the question of future operatioue, than for any other purpose. We regard it as conclusive proof of the great value of the vein, and feel confident that a test of the ore transferred immediately from the bottom of the shaft, at a depth of 300 feet from the outcrop, would show a very much larger yield.

The yield of four and a half tons was 163 ounces of silver, 950 fine, eqnal to $45.27 per ton, coin value, or $50.70 per ton, currency. The Scranton mine is situated nearly two miles west of the Ontonagon, from the ores of which the first test was made, showing a yield of something over $33. The Superior will next he tested, and its ore having heen mined with greater care than either of the others, we are prepared to hear of a result even more gratifying than that of the Scranton.

The effort to develop this newly discovered silverado is hut a repetition of the history of all new mining districts. People are slow to believe in anything meritorious nnless seen with their own eyes, and in this case the unbelievers are all tonnd among those who have never visited and examined the region in question. The same discoveries aud teste in one of the Rocky Mountain States or Territories would create such a furore as that which followed the discovery of the big honanza on the Comstock. But here it is something new, aud creetes scarcely a ripple of excitement except among those directly interested, and who see "millions in it." However, we can afford to wait. With the tests before us there is no reason to doubt the very great value of the Iron river veins, and that eooner or later capitelists will be attracted by the promise of rich returns which further developments will certainly hold out to them—if indeed they are not setisfied with the evidencee already presented.

The following report of the euperintendent of the worke, giving the result of the first teet, was mislaid and could not be found, or it would have heen published at the time.

ONTONAGON SILVER WORKS,
IRON RIVER, July 22, 1875.

TERRENCE MOORE, ESQ., Pres't Ontonagon Silver Co.: *Dear Sir:*—I respectfully submit the following brief report of the trial run just finished at the company,s mill. The mill was put in motiou on the 5th inst., hut owing to the difficulties incident to the etarting of new machinery, the run was not completed till the 20th. The rock treated was a lot of twenty-two tons taken ae it came from the mine. The result was 523 ounces of fine bullion, nearly 24 ounces per tou. Not having proper assay fixtures I could not determine its fineuess and coin value, but I estimated it at 950 fine, and its currency valne at $734. The mill is now in good condition, the only drawhack to its efficiency being its small capacity. A twenty-stamp mill conld reduce the ore at less than half the cost per ton that this five-stamp mill can treat it for. Reepectfully yours,

F. W. CROSBY.

The coet of miuing will not necessarily exceed $2.50 per ton, and this being the caee it is easy for any one to errive at a conclusion as to whether silver bearing rock which can he made to yield from $30 to $50 per tón will pay to work. Taking the average of the two teets which have been made—$40 per ton—and it will he seen that the net earnings of a twenty stamp mill would be over $1,400 per day, or over half a million a year. Mr. Crosby's estimate further ehows that the veins would pay handeomely if the average yield of silver wae not over $15 per ton.

A HOMOGENEOUS metal, combining the properties of iron and steel, by a composition which is not divnlged, is now being made in large quantities in England, mostly for best steam tubing and flangee, by the Darlaston steel and iron company. The price doee not exceed that of the best Yorkehire iron. Samplee have been euccessfully tested in presence of Admiralty officials.

Scientific Progress.

Preservation of Plaster Casts by Paraffine.—In relation to this new and useful process Mr. John Bell, of London, says in the *Journal of the Society of Arts:* The thorough saturation of plaster in melted paraffine will, I have reason to believe, preserve it from the weather in this country. An example so treated by me lay for some years on a marble block, in my garden here, in the open air, and remained uninjured. On the occasion, a good many years since, of a fancy fair for the benefit of the Female School of Art, connected with South Kensington, I contributed several specimens of small art works thus treated. This application of paraffine to plaster works of art was subsequently to this tried on a larger scale at South Kensington, without however any consultation with me, but from the want of proper treatment, it resulted in failure. The examples I have, and am ready to show, are apt to get rather too yellow, like yellow ivory, but my friend, Mr. G. F. Wilson, F. R. S., who obtained the paraffine for me in the first instance, tells me he thinks that if were quite pure, it would retain its color. The mode of saturation is no secret, as it is similar to that employed in the saturation of plaster casts in stearine. The paraffine hardens the plaster so much that the finger nail will scarcely scratch it. It increases its weight considerably, and gives it an appearance approaching transparency, like ivory, and preserves it in repeated washings.

A Beautiful Experiment in Instantaneous Crystallization.—Poligot.—Dissolve 150 parts by weight hyposulphite of soda in 15 parts boiling water, and gently pour it into a tall test glass so as to half fill it, keeping the solution warm by placing the glass in hot water. Dissolve 100 parts by weight sodic acetate in 15 parts hot water, and carefully pour it into the same glass, the latter will form an overlying layer on the surface of the former, and will not mix with it. When cool, there will be two supersaturated solutions. If a crystal of sodic hyposulphite be attached to a thread and carefully passed into the glass, it will traverse the acetate solution without disturbing it, but, on reaching the hyposulphite solution, will cause the latter to crystallize instantaneously in large rhomboidal prisms with oblique terminal faces. When the lower solution is completely crystallized, a crystal of sodic acetate similarly lowered into the upper solution will cause it to crystallize in oblique rhomboidal prisms. The appearance of the two different kinds of crystals will not fail to astonish those not acquainted with this class of experiments.—*La Nature.*

The "Life" of Submarine Cables.—The *English Money Market Review* says that a fact of some importance as tending to, if it does not entirely, dispel the prevailing impression that the "life" of a submarine cable is of a limited nature, was lately mentioned by Mr. John Pender, M. P., at a meeting of the Eastern telegraph company. He stated that the various sections of the Eastern system, with the exception of a short end of a short line at Lisbon which was undergoing repair, were in perfect working order. But of far greater importance, as affecting the future of submarine cable enterprise, was his announcement that the Suez and Aden section, which was laid in comparatively warm water, had improved in insulation by no less than thirty eight per cent. and the other cables of the Eastern company from forty-five to seventy-seven per cent. in insulation power, which is, of course, the chief element in estimating their capacity for the transmission of messages. Mr. Pender further stated that the cables longest laid have improved the most.

Terrestrial Magnetism.—If the earth is really a magnet, the magnetism of soft iron ought to be decomposed by it, in the same manner as is done by a bar magnet, and such is the fact. If a bar of soft iron is held in the direction which the magnetic needle assumes when freely suspended, its lower end immediately becomes a north pole, and its upper end a south pole, as is shown by bringing a small magnetic needle near each end of the bar. On inverting the bar, it will be found that its poles have immediately changed, the lower end being again a north pole, and the upper one a south pole. If the bar is held horizontally, pointing east and west, no such effect takes place. When a bar of iron is rendered magnetic by the influence of terrestrial magnetism, a stroke of a hammer will sometimes fix the magnetism, and the poles will not be reversed when the bar is inverted. But if several blows with the hammer be struck when in the inverted position, its magnetism may be destroyed or its poles be reversed.

The unequal solubility of different surfaces of the same crystal seems to have been demonstrated by M. Lecoq de Boisbaudren, who has communicated a paper upon the subject to the *Comptes Rendus.* He also has proved by his experiments that when a crystal is fractured it may be repaired by submersion in a supersaturated solution in the same salt without any increase upon its intact surfaces. Both of these are important and interesting facts bearing upon the theory of crystallization. If a liquid, therefore, be only saturated as regards its intact surfaces, it must inevitably be supersaturated with regard to its broken surfaces. This is the conclusion of M. de Boisbaudran.

The Nitrification of Arable Earth.—Recent experiments of MM. Boussingault and Schloesing are of considerable importance with reference to the theories of fertilization of soils and the utilization of manures, since they bring to light a number of interesting facts, which are summarized in the following conclusions: 1. Arable earth does not become nitrified at the expense of the nitrogen gas in the atmosphere. Agriculture has nothing to expect, from that source, which will tend to the profit of the crops. 2. The theory of a nitrification resulting from the combination of nitrogen gas and oxygen, in the presence of matters rich in hydrogen and carbon, according to the experiments above noted, is no longer sustainable. 3. The source of nitrogen of nitrates formed in the soil should be considered, in the absence of positive proof to the contrary, as reposing only in the nitrified organic matters combined with the mineral elements of the soil. 4. Nitrates in decomposing in the soil, under the influence of a reducing atmosphere, yield but a small fraction of their nitrogen, under the form of ammonia retained by the earth by virtue of its absorbing power. The balance of the nitrogen of the nitric acid returns to a gaseous state, and thus becomes lost to the crops.—*Scientific American.*

Deviation of the Compass.—A curious point in connection with the deviation of the compass on iron ships has attracted much attention on the part of scientific men. It is now believed that some of the sudden and hitherto unaccountable changes in the deviation of the compasses of such ships—which are often unsuspected until alleged as the only conceivable cause of the vessel's running ashore—are the effects of an unequal and varying distribution of heat over the iron hull. Sudden slight changes of compass deviation, not exceeding five degrees, have been noticed on board iron ships on our American coast, and these are now attributed to changes in the hull, occasioned by the vessel's passing from warm to cold water, and the reverse. The warm temperature of the Gulf Stream, taken in connection with the cold counter-currents, may account for many of the suspected compass errors on iron ships, and the devising of a remedy for this would be an excellent subject for study on the part of some enterprising inventor.

The Discovery of Photosulphide of Carbon.—It is generally well known that, chemically, oxygen and sulphur greatly resemble each other. The sulphide of carbon, however, analogous in properties and composition to carbonic acid, has hitherto been considered the sole sulphuretted compound of carbon, there being nothing recognized corresponding to carbonic oxide to the sulphur series. M. Sidot has recently made the important discovery of photosulphide of carbon, which compound he obtains by subjecting bisulphide of carbon to sunlight, when the liquid undergoes a profound decomposition. Half of the sulphur separates to be again dissolved in the bisulphide not yet altered, and at the same time a black powder is precipitated, which is the photosulphide sought for. This, washed and purified, is destitute of taste or odor, and is absolutely insoluble in neutral solvents. Acids act upon it, giving rise to more or less complex products. The author proposes to undertake a series of extended investigations into the properties of the new body.—*Scientific American.*

Edgerton's Oxy-Hydro-Carbon Light.—At the June meeting of the Institute, this invention was exhibited and described. It consists of a small copper vessel, placed immediately over the flame of a jet, arranged as in the ordinary oxy-hydrogen light, and so connected with a reservoir that the hydro-carbon oil can be fed into it as required. The heat of the flame converts the oil into vapor of high tension, which is carried to a chamber of about one-half cubic inch capacity at the base of the jet, where it mingles with the oxygen and is burned in the ordinary jet, and the flame projected against a piece of lime, as in the oxy-hydrogen light. In order to start the light it is necessary to first heat the generator with a spirit lamp, until vapor is produced, when the oxygen is turned on and the spirit lamp withdrawn. The inventor claims that the light thus produced is more brilliant and cheaper as well as more convenient, where it is difficult to obtain ordinary illuminating gas.—*Journal Franklin Institute*

Tempered Boracic Acid.—Tempered glass submitted to the polariscope exhibits centers, having a kind of activity under the light, but which disappear when the glass is annealed. According to M. de Luynes, boracic acid, cast and submitted to hardening, acts like glass, with the difference, however, that the peculiar property above noted is not dispelled on annealing. When submitted to moist air, a small lens of the acid undergoes curious internal modifications, resulting in two cones, disposed apex to apex, being formed within, which offer the most varying accidents of shape. M. de Luynes suggests that an analagous swelling may take place in other vitreous substances, and points out that certain geological phenomena may be traced to such cause.

A water-proof oil has been invented in Pittsburg, of which it is represented that it does not get rancid, cannot freeze, will not gum or fry out, is penetrating, dries quickly on the surface, yet makes and keeps the leather soft and pliable. It is also said to repel rats, mice and all manner of vermin.

Mechanical Progress.

Something New in Cannon Manufacture.

Military circles throughout Europe have of late become much interested in a new process lately adopted for the manufacture of cannon by General Euchatius, Director of the Imperial Arsenal at Vienna. The name "steel bronze" has been given to the process, as though it was accomplished by the use of a new metal, which is not the case, for there is no steel about it. The metal employed is nothing more than ordinary bronze or gun metal, in general use. Its superior resisting qualities are due simply to the manner in which it is manipulated after being cast. It is well known that bronze guns, under the strain of repeated firing, enlarge without any corresponding alteration of the exterior, and this soon becomes worthless. General Euchatius' plan to overcome this trouble is as follows: The gun is cast in the usual manner, hollow, and with a bore somewhat less in diameter than it is intended the finished gun shall have. A series of thirteen punches are then forced through the bore, each a little larger than the preceding one, whereby the bore is gradually enlarged, under a powerful pressure, while the metal is at the same time subjected to great friction, causing it to become extremely hard, and of a nature well suited for the subsequent rifling.

Twenty guns, thus prepared, have been tested in Austria during the past two years. The results obtained have been such that the Austrian government is now constructing two hundred batteries, or twelve hundred guns, at the rate of six batteries a week. A single gun so prepared has withstood 3,000 rounds without any perceptible deterioration; and others, even after being subjected to the severest tests—shells burst in their bores—appeared to lose nothing in point of accuracy of fire. In estimating the relative cost of these guns with those of other metals, the value of the bronze for remelting, after the gun has become worn out, must be taken into consideration. This done, the first cost of the Euchatius cannon is placed at less than half that of a Krupp steel piece, and very much below that of a Whitworth compressed steel gun, which, at a rough estimate, is about twenty per cent. more expensive than Krupp's

The Danks Puddling Furnace.

The Danks furnace which appears to work so well in this country, under the immediate supervision of the inventor, has been reported a failure in England. It was introduced there some two years ago by the North of England Industrial Iron and Coal company, one of the largest iron companies in England, and soon afterward reported a failure so far as its relation to profitable results are concerned. It was immediately superceded by the Crampton system—an English invention, under which heat is obtained from coal dust. It is undoubtedly true that the furnace, as originally constructed, is not a success; but practical iron masters have been at work upon it, both in this country and in England, and have introduced important improvements, which, in this country at least, have rendered the Danks furnace a success. If Mr. Danks had been able to give his personal attention at the works in England as here, it is probable that no failure would have been reported.

The furnace was introduced into several other English establishments all of which appear to be in sympathy with the North of England company in their estimation of its value. It is probable that national pride has not been altogether without its influence in determining the issue—Danks being an American and his rival, Crampton, an Englishman. It is confidently predicted by many experienced iron masters that Danks will eventually master all difficulties in the way of mechanical puddling, and so perfect his machine that it will show such a manifest superiority over Crampton's as to make it for the interest of all to give it the preference. It is thought that either pulverized or gas fuel will have to be adopted by Danks—in fact that the latter should be exclusively used by both Danks and Crampton. Recent experiments tend to show that the blow-pipe principle is preferable to any other, as by this agency a most fierce heat can readily be attained from carburetted hydrogen. The Danks furnace is pronounced a most decided success in this country, both in the economy of its use and in the quality of the iron which it produces.

New Process for Smelting Iron.—Some important experiments, says the *Ironmonger*, have been recently conducted at the Elsecar, English, iron works of Messrs. D. H. & Geo. Dawes, the object being the trial of a new process for the smelting of iron. The experiments have, so far, been most satisfactory, and when they are completed we hope to give a detailed account of them. In the meantime, suffice it to say that the principle now being tried will, if finally successful, cause, perhaps, the greatest revolution which has ever been made in the iron trade.

Economic Use of Coal.—One and two-thirds pounds of coal per horse power, per hour, is the consumption of fuel shown by the steamship *Plover*, a new boat built at Sunderland, England. She has compound engines indicating 562-horse power.

Steel Making Among the Hindoos.

Dr. A. Hunter, a contributor to the *Art Journal* says: The fuel employed by the steel making Hindoos is hard, dense, charcoal, made of the wood of the babool, or some species of the acacia. When the steel is melted the heat is kept up steadily for an hour or more, and the furnace months are closed with clay to exclude cold air, and to allow the metal to cool slowly. Next day the crucibles, when cold, are broken, and the lumps of steel removed and sorted into the different sizes for knives or small tools, daggers, spear heads or saw blades. The lumps of steel are called oollies, and they find a ready sale in most of the markets of India, at one shilling per pound. Till very lately there was a considerable export trade of Indian wootz steel to Upper India, Persia and Damascus. One of the peculiarities of this steel is its malleability and ductility, combined with great toughness; it requires to be worked, however, in a peculiar way, as it is easily spoilt if the heat be too great. The general rule is not to urge it beyond a dull cherry red, and not to keep it too long in the fire, as it becomes brittle and liable to crack if made white hot. Very heavy hammers are used in proportion to the size of the work, and the quicker the hammering the better are the tools or weapons. If the heat has been too great the steel is spoiled, and it cannot again be restored to its pristine malleability. The reason for this is, that a portion of the carbon has been burned away, and the metal has been reduced to a hard brittle iron, which opens into cracks and will not weld. To remedy this defect it is to beat out with soft malleable iron in bars, embedded in fresh charcoal, and covered with pieces of hoofs and horns, or old leather, and thus partially converted again into a soft steel.

The Iron Horse for Street Cars.—A correspondent of the *Scientific American* writes to that journal as follows: Most of your correspondents, when writing on the application of steam to street cars, seem to take it for granted that the power used must be either horse or locomotive, with no alternative. If by locomotive they mean cylinders connected to the car wheels, or to the wheels of a separate vehicle or machine, I must dissent, and agree with you that the horse is to draw these cars awhile longer; for there are some very important things about drawing a street car that locomotives cannot do practically. For instance, a large truck broke down on a track, and the several cars passing each minute were promptly drawn off the track and around the obstruction on the ordinary Belgian pavement, preventing a serious blockade; and this is not uncommon. However effective locomotives may be on a clear track with good rails, they are worth little off it, and on most street railways they would be off too often.

We think the case demands, not a locomotive, but literally an iron horse, that can, like any horse, be readily attached to and detached from the front of any car, with which it can be drawn off from or on to the track at pleasure, and need not be stopped by ice or mud.

The Strength of Wood and the Efficiency of the Axe.—In a recent volume of the annals of the Forest academy, at Mariabrun, near Vienne, Professor W. F. Exner gives a novel and highly instructive analysis of the elasticity and strength of wood, its resistance to splitting, and the theory of the use of the wedge, the axe, etc. The importance of these matters he shows to be very great, because great industries depend upon the facility with which wood can be split, and upon the applicability of certain kinds of wood. Having deduced a few simple formulæ to express the strength of woods and the power of the wedge, he develops a formula for the force with which an axe is handled, and shows what curve should be given to the face or cheek of the axe, in order to secure, under certain conditions, the least waste of power. By means of the formulæ he is able to demonstrate that the splitting efficiencies of the best axes made in America, Prague and Vienna, are to each other as 4·9, 9·2 and 13·3 respectively; and, applying his formulæ to the elaborate experiments of Nordlingen, he is able to deduce the absolute ease with which various woods can be split. It will thus be seen that the American axe possesses nearly three times the efficiency of the Vienna axe.

Iron Making in Japan.—Messrs. Head, Wrightson & Co., of the Teesdale iron works, Stockton-on-Tees, have just entered into a contract with the Japanese government to supply the whole of the necessary plant for two blast furnaces which are to be erected at the Heygori mines, in the north of Japan, where it is said that a rich ore containing 50 per cent. of metallic iron exists. These will be the first blast furnaces constructed in that part of the country. The professional adviser of the government is Mr. David Forbes, F. R. S., of London, a secretary of the Iron and Steel Institute. The furnaces will be 57 feet high, 10 feet in the bosh, for charcoal, and will be fitted with Whitwell's patent hot-blast stoves, Wrightson's patent charging apparatus, and all the most modern appliances in this department of engineering.

To Preserve Metallic Sodium.—According to Bottger, if sodium be placed in alcohol until its surface becomes brilliant, and then in naphthalic ether chemically pure, and finally in a concentrated solution of naphthaline in naphthelio ether, the metal may be preserved unalterable with its lustre unimpaired for a long time.

The Mining Share Market.

The bottom has dropped out of the stock market as we write, (Thursday night), but if it is possible for it to go much lower this week, it will probably do so on account of the difficulties of the Bank of California, mentioned in another column. At the end of last week the market showed signe of an advance and most people thought the "Fall rise" had set in, or a preliminary rise any how. But on Monday the market broke and has been trumbling down ever since. Ophir has sold as low as $36; California, $48; Con. Virginia, $240; Chollar, $60; California, $50; Gould and Curry, $17; Overman, $40, and other stocks in proportion. There has been a regular panic and many a small dealer has been cleaned out on a margin business. It is all laid to stringency of the money market, Flood & O'Brien, the new bauk, etc. Whatever the canse, it is certain that the market has been lower than for many a day, and California street seee many loug facee. The fluctuations of the market for the week can be seen by referring to our stock tables.

THE work of dredging the harbor channel at Wilmington, is progressing satisfactorily. Gen. Boschke, the contractor, has now got through the reef, and is working in hard cemented gravel and boulders. When completed, the width of the channel, under Boechke'e coutract, will he 60 teet, the entire length.

A NUMBER of the leadiug fieh dealers of this city have combined and offer a reward of $25 for the couvictiou of any person selling salmon in violation of the act prohibiting the eame, between the first of Angust and the first of November.

A BARK of 700 tons is being built at the Potrero, for the keel of which the 180-ft etick was brought here last week.

MINING SHAREHOLDERS' DIRECTORY.

Compiled every Thursday from Advertisements in the Mining and Scientific Press and other S. F. Journals.]

MESSRS. DEWEY & CO.—*Gentlemen:* To-day I received the patent and other papers of my animal trap, that you so successfully worked through the patent office for me, for which please accept my best wishes. The chances are that I will have another application for you to make for me before long. I am well satisfied with your manner of doing business, and I think inventors of this coast stand in their own light when they do not put their business into your hands.

I remain youra truly, A. M. GASS.

PURCHASERS pleass say advertised in Scisntific Press.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

California.

ALAMEDA

Livermore Coal Mine.—The editor of the Livermore *Enterprise* lately visited this mine. He found the boiler and general machinery being placed in position. The location of the engine is upon a solid foundation and convenient, while the boilers are placed about 100 ft below. The bunker, for the reception of the coal, is of the most complete and substantial character. While going down the shaft the vein of coal was noticed to improve from the top to a depth of 400 ft. At 300 ft a side drift is being run to the east to connect with the air shaft and is in upwards of 90 ft; is put through a fine body of coal, every foot of which indicates a continuation of the strata.

Coal Sample.—Alameda *Independent*, Aug. 20: We have a small specimen of coal handed us by a gentleman who brought it from the Black Hawk mine in the canyon east of Niles. It seems to be a good quality of coal, and shows that the explorers have something substantial to work for. Our informant states that the coal was found at a depth of 250 ft in the tunnel.

AMADOR.

The Phœnix.—*Foothills Ensign*, Aug. 20: The Phœnix mine, at Plymouth, the only mine at work in that section of the county, is only running from 20 to 30 stamps at present, on account of scarcity of water. Considerable alterations and improvements are being made in the way of straightening the shafts preparatory to facilitating the full prosecution of mining operations as soon as the supply of water will permit.

CALAVERAS.

Favorable.—Calaveras *Chronicle*, Aug. 22: The work of hauling rock to Garland's mill, from the San Bruno mine at Mosquito gulch, has been commenced. Rich ore is being taken from the stopes and the coming clean-up is expected to be the largest, for the amount of rock crushed, ever made by the San Bruno. Everything in connection with the mine is looking first-rate.

NEVADA.

The Kentucky.—*Foothill Tidings*, Aug. 21: The drift from the 300-ft level in this mine is now about 50 ft west of the shaft, along the vein, and a decided improvement is perceptible; the ground being of a very favorable character for pay ore. The quartz shows well in sulphurets and the general opinion among the miners is that the pay chute is near at hand.

Considerable work is being done by the Bear river mining company toward the development of their mines. Two forces of men are employed, one on the bank of Rock creek about 100 yards from its mouth, and the other some 2½ miles up the river. It is said that smelting works will be erected at Lincoln where cheap fuel can be secured from the coal mines of that town. So says the Wheatland *Free Press*.

INYO.

Tin Boulders.—*Independent*, Aug. 21: We were last week shown some specimens of what is supposed to be tin ore. It is in the shape of small oval-shaped boulders, varying in weight from an ounce to say five pounds. Mr. W. M. Hart, who exhibited these specimens, informs us that he can trace a range of these tin boulders, a 100 ft or more wide, for a distance of full 60 miles. Death valley being the locality. Should the proper test prove that this is really tin ore, as it seems to be, it is a discovery of vast importance as the quantity is simply inexhaustible. Mr. Hart and Mr. Gerrish of this place, associated with him, are both very sanguine it is the real stuff, at least enough so to be determined to have a thorough test made, which, it appears, cannot be done with the appliances at hand in common assay offices, and will therefore have to be sent to San Francisco.

Nevada.

WASHOE DISTRICT.

California.—The main drift on the 1400-ft level is steadily advancing toward the Ophir line, the face still in ore. Cross-cut No. 2, on the same level, is being driven east, the face in fine ore. Prospecting on the 1500 ft level is rapidly drawing to a close, nearly all having been done that can be, until the mill is ready to commence the extraction of ore. The new boilers for the mill have arrived and are being placed in position. The other machine work for both the crushing and amalgamating mills is advancing rapidly.

Ophir.—The repairs to the shaft and hoisting frame were completed and everything started up in fine running condition last Monday morning, since which time the regular amount of ore, 150 tons per day, has been extracted, the average assay of car samples running from $85 to $120 per ton. The ore is being mostly taken from the 1400 and 1500-ft levels, which are both looking remarkably well. Prospecting on the 1700-ft level has also been resumed, and the east cross-cut No. 4 is being again pushed rapidly ahead.

Justice.—The good ore showing of the south drift at the 800-ft level still continues, and the ore developments of the 400-ft level hold out well.

Cons. Virginia.—Daily yield, 600 tons of ore. The ore stopes were never looking better than at the present time or the quality of the ore better. The returns of bullion for the present month amount to $511,825.18, being in excess over the yield of last month at the same date of $175,813 38. The mills are kept steadily running and the prospects of the mine were never brighter. The ore bodies on both the 1400 and 1500-ft levels are being opened further to the southward, both proving rich as the work advances. Forty feet above the 1400-ft level a fine spur of ore, assaying over $100 to the ton, 20 ft in width and running away from the main ledge in a northwest course, has been struck. The cross-cut near the north line, on the 1550-ft level, is in a distance of 100 ft, the entire length in rich ore.

Centennial.—Active operations, as we have heretofore stated, are already inaugurated for the immediate and practical development of this valuable mining location. First-rate steam hoisting machinery is already purchased, and will be placed in working position at the mine as soon as the proper preparations can be made. The first of next week the sinking of the main working shaft will be commenced, the most eligible point having been selected for the purpose. It is to be a first-class 3-compartment shaft.

Crown Point.—The yield of ore is not so great as heretofore, owing to a scarcity of water in the Carson river, which has for the past week or two been gradually reducing the crushing capacity of the mills. The ore breasts and stopes show no perceptible change. On the 1600-ft level the main south drift is being gradually extended toward the Belcher line. At the same time a winze has been started from the 1500-ft level, which is to connect the main south drift for ventillation purposes. As soon as this connection is completed, the cross-cutting and prospecting of that portion of the mine will be commenced in good earnest.

Imperial Empire.—Work on the lower levels has gone right along and is progressing well at all points. The ore in the face of the south drift on the 2000-ft level still continues of a fine character, the assays running from $50 to $80 per ton. The north drift has been connected with the north winze which is greatly aiding the ventilation and cooling of the level. The ore developments at almost every point are proving more valuable.

Globe Consolidated.—Timbering the shaft above the third station level was finished today. The north drift on the level of the old Globe tunnel is being steadily extended, the face in a mixture of clay, quartz and porphyry, with a slight flow of water.

North Carson.—Face of lower tunnel in more favorable vein matter than last week, and driving forward into the main body. Nick Andrews, late foreman of the Savage mine, and well known for years as one of the best mining men on the Comstock, has been appointed superintendent.

Chollar-Potosi.—Sinking the main incline is going steadily forward without change of consequence during the week. The several prospecting drifts on the 1150, 1250 and 1300-ft levels are all steadily advancing to the southward, with no new features or important changes to record. Daily yield, 80 tons of ore, which is being extracted from the old upper levels.

Bullion.—Sinking the main incline goes steadily ahead, the bottom in good working ground. The enlarging of the incline adds greatly to the amount of work necessary for its reconstruction, and, as a matter of course, makes the progress of the shaft slower than it would otherwise be. The main north drift on the 1700-ft level from the Imperial shaft is pushed vigorously ahead, with steadily increasing ore prospects.

Hale & Norcross.—The formation in the face of the main west drift on the 2200-ft level is softening, and showing evident indications of a near approach to the vein. It is confidently believed that the ledge will be reached in a very short time.

Wells Fargo.—Excellent progress continues to be made in sinking the shaft. It is now a little more than 400 ft in depth, and has run through the hard strata recently encountered into softer and more favorable ground.

Utah.—The hoisting engines are again in the finest possible running condition, the shafts cleared of water and two new sets of timbers added at the bottom, and the sinking resumed in good earnest. The 400-ft level is being also put in good condition for more cross-cutting. Everything about the mine now appears to be in just the best condition possible for rapid and steady developments.

Belcher.—The daily yield of the mine has been considerably decreased during the week, the scarcity of water in the Carson river making it impossible for the mills to crush their usual quota of ore. There is but little change in any of the ore producing sections of the mine.

Yellow Jacket.—The south winze is down 185 ft below the 1700-ft level, the bottom quite dry. The north winze on the same level is down 100 ft, the bottom also dry. The main north drift on the 1740 ft level is in a distance of 475 ft from the turn-table, the face in hard porphyry.

Iowa.—The shaft is down 410 ft. At the depth of 400 ft a station has been opened and a drift started to cut the ledge. This drift is now in a distance of 20 ft, the face in good running ground, and will have about 150 ft to run to cut the ledge.

Dayton.—A thorough trial of the new machinery shows that everything is in as fine a working condition as it is possible for it to be. The hoisting tanks have lowered the water to the second station level, at which point it is the intention to start the large new pump, so that it cannot now be but a very few days more before the water will be drained from the shaft.

Overman.—The water is drained to a point below the 1100-ft station, in the shaft, where it still remains, no great effort being made to drain the bottom of the shaft.

Caledonia.—The erection of the new hoisting and pumping machinery is progressing with all the speed possible. Sinking the new shaft is making splendid progress.

Gould & Curry.—The repairs to the shaft are nearly completed; also the enlarging and leveling of the drift connecting with the Best & Belcher on the 1400-ft level. Everything is fast assuming a favorable shape for the prospecting and development of the ore vein on the lower levels.

North Cons. Virginia.—Sinking the shaft goes steadily ahead without change or intermission. There is no water to interfere. The hoisting machinery works as well as it is possible for it to do.

Seaton.—The steady decrease in the flow of water is greatly reducing the cost of running the machinery, the amount of wood consumed being much less. Drifting on the second station level will soon be commenced.

Florida.—Face of west drift at the 400 ft level in very encouraging vein matter, with but a small flow of water, the strong influx at first encountered having become pretty well drained out. From this circumstance the ground does not swell so badly as heretofore, and is therefore easier managed.

Savage.—All work on the 2000-ft level is suspended for the present. Both the north and south drifts on the 2200-ft level are steadily advancing, without any change of importence.

Leviathan.—The proposed drift in the main ore vein, spoken of in last week's report, is now commenced, being the practical opening of the 250-ft level of the mine.

Phil. Sheridan.—In accordance with the recommendation of Superintendent Jones, mentioned in our last report, new and powerful hoisting machinery has been ordered from San Francisco, and is now on its way over the mountains. Grading for the site of the new hoisting works and machinery is making steady and favorable progress.

Original Gold Hill.—A fine showing of ore is being developed by the north drift, which is evidently running into a body of considerable extent. The south ore body shows better and better as further developed.

Julia.—Sinking the main shaft is going steadily forward, everything working with the utmost perfection. Driving the main south drift on the 1000-ft level is also making rapid progress, with greatly increasing prospects. The mine never looked more favorable for the development of something valuable than at present.

Succor.—The rock in the face of the main west drift on the 550-ft level is somewhat harder than for some time past. The clay seams appear to be giving out.

Sutro.—The rock of the main west tunnel is extremely hard, making the progress necessarily very slow.

West Belcher.—The tunnel is still pushed vigorously ahead, with increasing prospects. The indications for the development of a paying mine are excellent.

Mexican.—Sinking the winze below the 1465-ft level has been resumed. The bottom is still in favorable quartz and ledge matter with occasional spots of ore.

Daney.—The repairs and erection of the new machinery is steadily advancing, and will be completed ready to start up by the first of the coming month.

Woodville Cons.—The chamber for the head of the incline is finished and timbered, ready for resuming the sinking.

Nevada.—The ore in the face of the drift shows considerable improvement over last week, being more concentrated and giving better assays.

Industrial Items.

Work on the railroad from Anaheim to Tustin has commenced. A bridge across the Santa Ana river is to be built, the county furnishing $20,000 of the necessary amount and the railroad the remainder. The bridge will be a wagon and railroad bridge and quite a substantial structure.

The grading and tunneling work on the line between Caliente and Los Angeles is being pushed forward with great vigor. 1,000 men are now employed in the San Fernando tunnel, and when working space can be enlarged the force will be increased to 1,500.

A private dispatch from the East announces that a large contract for kerseye (for soldiers' clothing) has been awarded by the War Department to Douald McLenuan, of the Mission woolen mills.

The North Pacific coast narrow gauge railroad company are pushing their road toward Duncan's mills. The company propose to run a branch to Guerneville.

The grading through the Tehatchipe pass is progressing rapidly, 1,800 workmen being employed on that division.

The depot in Los Angeles of the L. A and I. R. R., is to be located upon San Pedro street in that city.

Building is progressing rapidly at Santa Moiuca.

Fine Display at the Mechanic's Fair.

Some of the departments already make displays which outdo in quality any similar ones at previous Fairs, while the scale on which they are presented far surpasses any former exhibition. The machinery department will, without doubt, be first-class, as all the space was taken some time since. Several exhibitors were prevented from want of space to make a display in this department. Among them was Mr. Ghirardelli, who has a small stand opposite that of the *Fair Daily*, where he has coffee, chocolate, broma, spices, etc. He has recently imported expensive and newly invented machinery for the manufacture of chocolate, which he intended to have in working order at the Fair, and show the public the process by which the article is made. Unfortunately the Managers were unable to give him sufficient space.

The rock drills and mining machinery show off well in this department. Of pumps there are not so many kinds as usual, but what are shown are elegantly finished, and several are new patterns. A large display of wood-working machinery is made, and a great variety. Most of this is finely finished and will attract great attention. The wire and wire rope makers come up to the mark well, and show what our California manufacturers in this line can do. The furniture display will, when completed, be large and elegant. Carriages and wagons are already there in great variety and number, although manufacturers and dealers are not all represented as yet. The agricultural machinery this year is not quite as plenty as last, but we cannot tell yet what it will be. The exhibit of saws, etc., is a fine one and tastefully arranged. The two glass factories, now consolidated under one proprietorship, make a varied display of home manufactured articles, quite creditable to our local industries. In this display are several California inventions put to practical use. The cutlery artizans show some handsome home made goods, of neat design and fine finish. The San Francisco made rope looks strong and serviceable, and the strands look as well laid as the famous New Bedford article, being uniform and smooth. The wooden ware exhibit is great in uppearence and arrangement, and the articles look perfectly able to drive out Eastern competition with little exertion. The stoves, ranges and culinery articles shown by different exhibitors are an attraction for the ladies, and are well worth examining by all. Many of them are made in this State, in a style and finish very creditable to our artizans. The scales and balances of all varieties shown are handsome and useful, and are worthy of close examination. The home made carpets and woolen goods show what our manufacturers in this line can do. Pianos are not quite as plenty this year as usual, and the sewing machine men have not as yet come up to the mark. The silver plated goods and fancy articles help greatly in finishing off the appearance of less pretentious, but more useful appliances. The billiard table manufacturers are getting ready but have not all appeared yet. Spring mattrasses, bed lounges, etc., are plenty and in considerable variety. Small articles of every conceivable character are scattered over the building, which are of interest to many people. A feature of the display this year is the unusual number of articles of home manufacture in place of similar imported exhibits. This is a cause of great congratulation to the citizens of this State, who should do all in their power to encourage such manufactures.

No Reduced Rates by Rail.

We have received several letters from people in the interior, desirous of visiting the Fair, asking if the management had made any arrangements with the railroad companies for reduced rates to the city during the Exhibition. They say it has been advertised for several weeks in the papers that half-priced tickets will be issued to visitors to the State Fair at Sacramento, but no such arrangement has been announced as having been made for the Mechanics' Fair, which is really *the* exhibition of California. We are asked if the half fare business has been suggested. On inquiring of the Board of Managers, we are informed that they endeavored to make some arrangement of the kind with the railroad companies, but were unable to do so. The railroad men said that they carried plenty of passengers to San Francisco at all times, and a temporary reduction of rates would do no good to the Fair. People who could come would do so anyhow, and many of the travelers who thought nothing of the Fair would take advantage of the low rates, of course. This would cause a falling off of railroad receipts, and cause no increase in Fair receipts, so they refused to reduce the rates to San Francisco. To get people to Sacramento is a different thing. They require some strong inducement to go there at all, and it is as much as the big Fair, the little fare and horse races combined can do to get a good crowd together. We are sorry the railroad folks won't encourage the interior people to come to the Fair, but they can get even on the company by calling them "monopolists" and other hard names.

The Western Union telegraph company will change their line from Colfax to Nevada, and place it on the route of the Nevada county narrow gauge railroad company, establishing offices on the line of the route.

The Navigator Islands.

Samea, the latest ecene of the latest filbnstering en the pert of our nen-aggressive Administretien, is a group of islands, better knowen es the Navigaters, and lying hetween latitude thirteen degreee thirty minutee and fourteen degrees tbirty minutes south, and lengitude one bundred and sixty-eight degrees and one hundred and seventy-three degreee west, consieting of feur principal and five leeser ielands; they are knewn as Apelima, Manono, Savaii, Rose, Olesinga, Ofu, Manna, Tutuila and Annu. They were first seen hy Bengainville in 1768, and La Peronse in l'Astrelahe in 1787, though Kruseustein considers them te he the same as the Bauman islands, discovered by Roggeweid in 1721. They were revisited at varieus times by the early navigaters, hut their topographical and hydrographical natures were unknown until the United Statee exploriug expedition, under Wilkes, made tbe famous surveys that eliminated the previeus prolific chances ef danger in tbe greup.

All the islands excepting Rese are of velcanic origin, and there are still extant remaine of extinct velcanees, especially in Apelima, Savaii, Tutuila and in Lake Lanto, on the ridge of Upela, 2,570 feet above the sea level. The area ef the group is about 2,560 square miles, and the pepulatien ie estimated roughly at 20,000 —a marked decreaee from the estimate of 1840, which placed it at 55,000, end from the still later one of Admiral Erskine in 1849, which gave it frem Missienary seurcee at 37,000.

Savaii, Tutuila, Maneno and Upelu are the islande that attract the greatest interest at present, Upolu heing the seat ef the new Gevernment, Savaii, the largest; Manono, frem its possession of the halance ef power, and Tutuila ae the unrepentant and rebellious district which refuees te enter the new confederatien, but sticks with grim determinetion te the flag and laws furnished by Commander Meade in his vieit to the islands in 1872. Saveii is ferty milee in length and twenty in breadth, and furnishee the largest quota to the fighting forces of the federatien, but the comparative unfitness of its harbors, its difficulty of approach, the absence of permanent streams, and its broken and irregular coral barrier degrade it to the second place in importance, and yields the first to Upolu.

The Crete de Coq of Kotzebue, and the emallest islands of the group, lies inside the same reef ae Upolu, and hetween it and Savaii, seven miles distant. It is the Gibraltar of the nation, eelected with rare wisdom hy eome prehistoric Gabel al Tarck of those seas, and so fortified by nature as practically to he impregnable to the resources of Samoan warfare. It is simply the crater of an extinct volcano—a periphery of perpendicular rocks, fringed with a narrow habitable helt, and broken only at the northern point, where its natural entrance is so narrow that hut a single canoe can enter at a time.

The population does not uumber more than a thousand, hut these are skilled sailors, brave in war, very vikings of the austral land, and so feared that it is a tradition of the people that as go Manono and his sailor warriors, so goes Samoa. Tutuila is the windward island, and the prohable port of entry and commercial depot of the future. It is high and of volcanic appearance, and of comparative limited value as a producing country. It is the old Maouno of Bongainville, and for years suffered an undeeerved reputation from the murder of the Comte de Langle, M. de Lumanan and a boat's crew helouging to La Perouse's expedition. Later evidence proves that these murdere were reprisals for the shooting of a native on hoard l'Astrolabe for some imaginary offence. The island is seventeen miles long, and in ite greatest hreadth about five miles, generally precipitieus, diversified by narrow table lands and tortuous valleys.

The district of Pango-Pango possesses the best harhor, and was selected by Mr. Webb as the coal depot for the steamere of the Australian and Intercolonial line. Its importance wae so highly appreciated by Cemmander Richard Meade, of the navy, that he surveyed it in the *Narragansett*, and during his stay laid down the harbor accurately, selected the moet available site for depots and steamers, framed a code of laws for the people, founded a local government wise, judicious and eminently euited to the race and climate, and plauted the seeds of an authority that seeme so satisfactorily to have flouished that it possesses inherent strength enough to defy the flatteries and threats of Steinborger aud his coterie. This harbor, if any, will probahly be the entrepot for the trade of the group with the outside world. and is hy far the hest, not only in this group, hut in Polynesia. Evidently the crater of an extinct volcano, ite ehape approximates most nearly to a chemist's retort, and so perfectly is it landlocked that after access it is a matter of impossibility to discover the entrance. The sides are frowning, precipitous mural cliffs, clothed in ultra-tropical verdure to the summit; then straightening iuto narrow table lands that might he made available, with due labor and energy, for plantatious. Tho shore line is generally narrow, with steep approaches, affording facilitiee for docks and loading and unloading of ehips of any draught, with sufficient room ashore for storehouses and the modest villages that the trade would demand. Tho uatives aro peaceable and well-disposed, and so fas as could be judged as much Christianized as can be hoped for from the average Kanaka, be hie island what it may.

Upolu, the capital, is of volcanic origin, and, unlike Savaii, precipitous, broken, and, except in occasional places, not well adapted to cultivation; it is bigh and split and fissnred, hut yet rich and heantiful, especially in the parts exposed to the trade winds. The eastern part is surreunded hy a ridge running eest and west, with outlying spurs that tend in a northwestern and seutheasteru directien. It possesses a number ef excellent barhers, permanent, full-volumed streams and feeders; is entirely surrounded by a coral breakwater, and, like Tahiti, is on the seuthern side luxuriant and admirably adapted in places to moderate coffee end sugar plantations.

Its principal harbor is secnre, with safe anchorage for twenty ships; plenty of water, though the entrance threugh the reef is narrew, and with certain winds dengereus. The climete is trepicel and healthy, the extreme heat being tempered by the trade winds; but from November to May hurricanes are not uufrequent and always severe.

At preeent Apia, in Upolu, is the principal settlement of the greup, and consists of three towns, separated hy small streams, and rejeicing heth in English and native names.

Malauta, the chief native settlement, is the American town, Apia preper, the English, and Mantafela the Germen.

The bulk of the trade is in the hands of the Germans, the house ef Godefrey hrethers of Hamhurg poseessing an extensive establishmeut at Mentafela, where husiness tact aud good fellowship go hand-in-hend. They export nearly all the cehra er dried coceauut, in which the main traffic consists, have nearly fifty ships, ef all eizes, in the trade, and their enterprise is so extended and their energy so untiring that it will require a serious effort to dispossess them of a tithe of their business with the groups fer hundreds of miles te windward and to leeward. What other trade there is in the grenp ie purely local. What well directed efforts will do it is difficult to predict; but there is iu the land and sea capahilities of prodnction that would repay, not fabulously, but with the same percentage ef profit that ehtains in any other ceuntry ef the same isothermal and isoleted nature.—*Y. H. Herald.*

A Bonanza in Mexico.

The New York *Times* notices the meeting a few days since in that city, of the stockholders the New York and Sauta Eulalia eilver mining company, of Chihuahua, Mexico, and an increase of the capital stock of the same from $3,000,000 to $6,000,000. The *Times* gives the following account of the discovery of the silver mines of Santa Enlalia.

"In 1703 three malefactors of the theu small town of Chihuahua, Mexico, flying from justice, betook themselves to the surrounding mountains, and there for several weeke lived a life of terror, moving ahout from fastness to fastness in constant dread of the fierce Apaches who occupied the Territory on the one hand, and of their pursuing white bretbren on the other. One evening they hnilt a large fire in a ravine to cook their supper, and when the surrounding howlders became heated a molten white metal issued out of them. The next day a friendly Indian arrived in Chihnahua hearing a message from the fugitives to the priestly authorities offering as a condition for their pardon enough silver to build a cathedral, which offer was accepted."

Wonderful stories are told of the wealth of these mines. They were worked by the Spaniarde from the time of their discovery as mentioned above, until 1822, the years of the revolution which drove that people out of the country. During this period Chihuahua grew from a mere ontpoet of the Jesuit missionaries into a city of 56,000 inhabitants, while the mining village of Santa Enlalia and another sprang up in the gorges of the mountain, containing respectively 8,000 and 5,000 souls. From a tax of one real (twelve and a half cents) on every mark (pound) of silver, as it came from the refining furnaces, there was bnilt, between 1738 and 1750, the celebrated Cathedral of Chihuahua, at a cost of over $600,000, and with the surplus was erected another church in the village of Santa Eulalia at a cost of $100,000. While Mexico was in, possession of the crown of Spain, the laws of that kingdom required one-fifth of the product ef all the miues of gold and silver to he paid into the royal treasury. Tbis made it necessary for the mining proprietors to make returns of the products of their mines to the king's officers. These records were kept with Spanish formality in the different mints of the vice-royalty; and the records still preserved, show that nearly $500,000,000 were registe ed in that office, most of which was the production of the mines of Santa Eulalia.

The internal commotions which convulsed Mexico the years succeeding the revolution, paralyzed her mining industries and put a stop to the development. A writer in *Harper's Magazine*, who visited tbe silver mountain in 1867, gave a glowing description of the untold treasures than that lay exposed to any hand of sufficient capital and energy that was disposed to grasp them. The mountain, according to that writer, is one eolid mass of silver ore, averaging from $50 to $150 per ton, with occasional pockets panning out as high as $5,000 per tou, and still rarer finds of pure metal. The ore is imbedded in hard limestone chambers, which are always entirely free from water, and never require timbering. The country being extremely difficult for the transportation of machinery, only the rndest appliancee were ever used. The ore was carried up out of the mines in sacke, on the hacks of workmen, on primitive ladders. It was tben either reduced on the spot or placed on the hacks of assee and transperted seven miles to water. The proprietors of tbe reduction works on the greund built an aqueduct of stone fer the trausportetien of water te the mines, thirteen milee long. This aqueduct still exists unimpaired, and is said te he a marvel of engineering skill aud solidity. The furnaces used were of the simplest kind. Thsy were constructed ef adobe mud, and were utterly incempetent to extract a tithe ef the metal contained in the ore. In 1867, the writer ef the article mentioned, saw ene of these rude furnaces at werk, and narretes tbat the few lazy perseus who remained ef the thriving village of Santa Eulalia, picked up a good living hy breaking open the hills ef rotten slag that remained after a century and a half of primitive reductien and gathering the little lumpe of silver that filled it in all directions. The writer descended inte all the mines in the meuntain, and found them alike in the quality and universality of ore. Two of them also contained a "flux" which the Spaniards found useful in smelting.

In the early part of 1874, Mr. William L. Helfenstein visited Chihuahna and made a personal examination of the Santa Eulalia mines. He at once set on foet a negotiatien fer some of the principal mines, and returned to Chihauhau about the close of last year end concluded the negotiatien. Then, leaving it in charge of George L. McManus, an American gentleman, twenty-five years a resident of Chihauhau, Mr. Helfenstein returned te New Yerk and erganized the New York and Santa Eulalia silver mining company.

Meantime, in November last, Mr. Helfenstein shipped a large quantity of machinery to the mines. In May, Mr. Helfenstein, in company with the vice-president of the compeny, paid a third visit to Chihauhau. The machinery had arrived in good conditien. During the months of February, March, April, and half of May, Superiutendent McManus had taken out of the mines $20,000 hy means of the original appliances, using twe of the old adobe furnaces te smelt the ore. He had alse made extensive aud valuable improvements abont the greunde. At his suggestion 7,000 acres of land, situated at the junction of the two streams that form tbe Chihuahua river, were purchesed for the purpose of erecting upon them reduction works on a scale larger than was practicable in the village of Santa Eulalia.

The reporter who gathered the information for the *Times* is of the opinion tbat Col. Tom Scott, of the Texas Pacific railway, is tho leading spirit in this mining enterprise and that his jaunt to Mexico was in that interest aud further that the Honorable Senators who were only dismayed from accompanying him by fear of the yellow fever—or public opinion—are also interested in this Mexican bonanza. The stockholders, whoever they are, indulge, it is said, in visions of untold wealth from tho development of the Santa Eulalia.

The Invention of the Flat-Footed or Tee Rail.

The last nnmher of the Journal of the Franklin Institute contains letters which seem to prove conclusively that the flat-footed or tee rail was designed by Robt. L. Stevens, of New Jersey, in 1830, and not by Charles B. Vignoles, late President of the institute of Civil Engineers of England, as is commonly believed in Europe. W. M. Evans, a civil engineer, in writing to the President of the Institute, sends, with his letter, two pieces of rail, which he pronounces "specimens of what we may call an historical rail; they are cut from one of the first flat-footed rails ever rolled. This rail was designed in 1830 by Robert L. Stevens, of New Jersey, for the Camden and Amboy railroad, was rolled in 1831, and laid in 1832. Many of these rails I saw laid;" and Mr. Evans refers to the dates mentioned as conclusive evidence that "Mr. Stevens was the designer and originator of the flat-footed rail, a rail now known throughout all Europe as the Vignoles rail." The quality of the iron used was also very superior, as it appears that after the raile referred to had been used for ahout twenty years on the main track they subsequently did service for twenty yeare on a siding. Mr. Evans also claime that Mr. Stevens' designs embraced the first approach to the fish-plate now in general use. Evidence seems to be constantly accumulating that in railway invention now, as well as in the infancy of the system, and before it was established, the United Statee held a front rank.

Artesian Water in Kern County.—The Fresno *Expositor* of June 30th says: "John Heinlein, who resides in the Mussel Slongh settlement, near Kingston, has been for some time past engaged in boring for artesian water on his land in the vicinity mentioned. He has sunk a well 153 feet deep, at a costrising above $1,000. At that depth he struck a flowing well, though the amount of water it yields is very small. W. H. Souther, who live two miles from the southeastern end of Kern lake, has found water at a depth of 250 feet, and which comes up with great force, throwing a stream seven inches in diameter twelve feet above the surface of the ground. The water is clear and cold, and very pure—free from brackish taste or vegetable matter. Several persone are boring for water in Tulare county."

The Bird Question.

In an article entitled "The Bird Queetion," published in the eeventh volnme of the Transactions of the Illinois Horticulturel Society, showing the indispensable agency of birde in holding the insect world in check. It is admitted, nevertheless, tbat if any speeies of birde sbeuld actually hecome so numeroue aud injurieue as to interfere essentially with the cultivation of any impertant crop, it would fall inte the same category with noxious insects, and that it might therefere beceme neceeeary te reduce its numhers.

I have since queetioned very much the propriety of disseminating this doctrine, hecanee, though it may he theoretically true, it remaine to he proved that any such case has really occurred, er that it is likely te do so; and the danger ie that any admission of this kind is so liable te he taken by theughtless persons ae a sanction fer destroying these heantiful and almost universelly useful creatures, under circumstances which ceuld by no means justify the cruel practice.

As stated in the article referred te, there are, fortunetely, only a few species of birds which have heen accused ef being seriously injurioue te the farmer or the horticulturist, and theee feed largely upon insects during all parts of the year except the few weeks in which they regale themselves upen the ripening fruits. The two spices of birds which have been signalized as most injurious to the horticulturist, en account of tbeir habit ef picking into the ripe grapes, and thus damaging more than they devour, are the quaint veiced catbird, and that elegant ornament of our greunde, the Baltimere eriole er gelden robin. Both ef these are active destreyers of inseote, and like the great majority of birds, feed their young exclusively upon thie kind of diet. They have beth frequented my garden the present seasen, and I have heen much intereeted in watching the assiduity with which a pair of cathirds fed their young with varioue kinds of werms or larvæ, tbeir neet having heen built in a syringa hnsh which wee trained against the side of tbe house.

1 have also ohserved the golden rohin in ite eearch after insects, and on one instance saw a female alight upon the perpendicular trunk of an apple tree, clinging to it witb much tenacity, though not with the ease of the woodpecker, she would sometimes even etand with her head downward, then let go her hold and cetch in a new place; and once darted off after a moth, which sbe bad dislodged from ite hiding place; and this is just the situation where she would be most likely to captnre the codling moth ae it emerged from its pupal covering, under tho hark.—*W. L. B., in Prairie Farmer.*

An Oyster's Heart.

Near the hinge of an oyster is a cavity which leads to the stomach. It may he called, with a little license, its mouth; not that it hae teeth, or that it in any way masticates food, or that it indicates the place of the head, for the oyeter belongs to a division of molluska, known as the *acephalates*, or headless ones. But it is functionally a mouth, and is like mouths in two important particulars. It ie the entrance of the food to the alimentary canal, and it has certain lip-like organs with which to control the entering food. If, then, tbe oyster'e mouth is thus situated near the hinge, that part of the creature should be known as its interior, or forward end. The opening end, that which the oystermen calls the "nih," ie therefore really the posterior extremity.

Every ono knowe that in opening an oyster the knife has to he passed through a stout organ, wrougly called hy many the eye; for the oystor is eyeless. Some call it tbe heart. Tbis also is incorrect. It is the great adductor muecle, with which tbe animal draws together its valves. But the oyster has a true heart. It is situated near to and forward of the adductor muscles, that is, hetween it and the mouth. If the fingor of a glove were cut off and inflated with air, heing closed up at the end, and then a thread were tied round so ae to constrict it at the middle, we ehonld have some resembling the shape pretty nearly of the oyeter'e heart. This small organ, is divided hy the constriction into two lesser organs, an auricle and a ventricle; a receiving and a distributing reservoir of the pale, opalescent hlood—its true life current, which animates every part of this complex little heing.

It an oyster he opened with suffieient tact and care, the heart can he eeen at work, beating much as our hearts beat—a true rythmical pulsatiou. Indeed, with a watch in hand, the beats can be counted, as when a physician makes a diagnoeis of one's pulse. As death nears, so slow the throbs of the oyster'e heart. —*Educational Monthly.*

A Pretty Idea.—A hanging-garden of sponge is one of the lateet novelties in gardening. Take a white sponge, of large size, and sow it full of rice, oats or wheat. Tben place it for a week or ten days in a sballow dish, and as the sponge will absorh tho moisture, the seede will begin to sprout before many days. When this has fairly taken place, tho sponge may he snepended by means of cords from a hook in the top of the window, where a little sun will enter. It will thus hecome like a mass of green, and can be kept wet by the mere immereion of it in a bowl of water.

Useful Information.

Artificial Down and Cloth from Feathers.—In Paris "artificial down" has come to be more highly valued than the natural down, because it is much lighter. It is made from feathers of any kind by cutting the barbs of the feathers from each side of the quill, putting them in a stout cloth sack, and rubbing them between the hands, as a washerwoman does linen. Five minutes' rubbing will have mixed the mass into a felt-like substance, rendering it homogeneous. This is *edredon artificiel*, and sells in Paris for something over $8 in gold a pound, and this price is constantly increasing. A process has also been invented for making cloth of feathers. To make a square metre (a metre is 39.3 inches) of cloth lighter and warmer than wool, from 700 to 750 grammes (a gramme is 15.4 grains) of this down are required. But this *drap de plume* takes color admirably, and wears wonderfully, because, instead of breaking and cutting in the places most exposed to wear it mats itself more and more into a felt-like substance. The estimate has been made that in France alone enough feathers are allowed to go to waste each year to make from 7,000,000 to 8,000,000 square metres of cloth. In other words, as much is lost in France in feathers as is paid for cotton.

Brightening Iron.—A Bavarian serial contains a method of brightening iron recommended by Boden. The articles to be brightened are, when taken from the forge or the rolls, in the case of such articles as plates, wire, etc., placed in dilute sulphuric acid (1 to 20), cleansing the articles, which are then washed clean with water and dried with sawdust. They are then dipped for a second or so in nitrous acid, washed carefully, dried in sawdost, and rubbed clean. It is said that iron goods thus treated acquire a bright surface, having a white glance, without undergoing any of the usual polishing operations. This is a process that those interested can easily test for themselves, but care should be taken with the nitrous acid, not to inhale any of its fumes. Boden states that the action of the sulphuric acid is increased by the addition of a little carbolic acid, but is difficult to see what effect this can have, and it may very well be dispensed with.

Insect Intelligence.—L. G. Fellner states that the large red ants of Arizona Territory adorn their dwellings with stones, shells, etc. "I have often distnrbed their piles in order to find garnets, etc. The ant on guard would then regularly call out an army of minature warriors, whose attacks I had to avoid. As I stirred one with a stick, the guard ran inside; but instead of returning with a number of angry nnts, he brought out a large clear garnet and rolled it down towards me; I kept stirring until he had bronght five, when I thought the sagacione animal had been taxed sufficiently."

Silvering Natural Leaves and Flowers.—A very ingenions application of electro-metallurgy has recently been bronght before the notice of the Society of Arts in London. It consists in the application of a coat of silver, by means of electro-deposition, on natnral leaves and flewers. By this means very delicate ornaments are produced, since the precise form and texture of the natural leaf is preserved under the thin silver film. The special process by which these results are attained is the invention of a Mr. Denton.

Treating Chromos.—Chromos should never be exposed to the direct rays of the sun. Fly-specks, dust and other obscuratione upon the surface of chromos may be removed by careful rubbing with a chamois-skin or a soft piece of linen cloth slightly dampened. Whenever the original varnish coating is dulled, bruised or rubbed, revarnish it with mastic varnish, such as is used by artists for varnishing paintings.

To Oil a Belt.—The best mode of oiling a belt is to take it from the pulleys and immerse it in a warm solution of tallow and oil; after allowing it to remain a few moments the belt should be immersed in water heated to 100o Fah., and instantly removed. This will drive the oil and tallow all in, and at the same time properly temper the leather.

Babbitt Metal was invented by Isaac Babbitt, of Boston, and is used because it makes a good bearing without any fitting. Its composition, by weight, is: Tin 50 parts, antimony 5 parts, copper 1 part. There are numerous other recipes for Babbitt metal of different grades, but this forms a good composition for general nse.

Marine Aquariums.—A writer in a Belgien journal says that he has successfully kept a marine aquarium for nearly ten years without renewing the sea water in it; all that he does being to add fresh water as the salt water evaporates, the same degree of saltness being invariably maintained.

It is a somewhat singolar fact that in the stomachs of nearly all large eels taken in the Delaware, numbers of mussels are found. How the fish succeeds in removing them from the shell is a mystery.

To Remove Kerosene Oil from Carpets.—Scrub the oil spot thoroughly with hot water in which either ammonia or ox gall has been put. Repeat the process if necessary.

Testing Portland Cement.—Three tests are used: 1. Resistance to the tensile force. 2 Specific gravity. 3. Water test. The first is by making a specimen briquette in a mold with a transverse section of 2.25 square inches, the specimen being held vertically in clips, which is placed under the short arm of a steel yard balance, and broken. Mr. Bazalgette used a test of 500 lbs. on an area of 2.25 square inches after 7 days immersion in water. The second method is by finding the weight in ponnds of the struck bushel. The water test is useful when the others cannot be applied. It consists of ganging a small quantity of the dry powder with water, and immediately immersing it in water. If the sharper edges crack or break away after a short time, the cement is too hot or fresh, or is inferior in quality. The weight of good Portland cement ranges from 100 lbs. to 130 lbs. per bushel, equal to from 80 lbs. to 130 lbs. per cubic foot. The lighter kinds set more rapidly than the heavier, but are weaker. Mr. Bazalgette specified a specific gravity of 110 lbs. to the bushel.

Benefits of Competition.—The California borax has come into active competition with that from other sources, and whilst at the beginning of 1874 the price of refined borax in the English market was 100*l*. per ton, it can at the present time be bought for 56*l*. The pottery districts, where large quntities of borax are consumed, are perhaps the chief gainers on this side of the Atlantic by the discovery adverted to.—*British Trade Journal.*

Water in Gas Meters.—Dr. Redner calculates that for every cubic metre of gas recorded as having passed through a wet gas meter, 23 litres of aqueous vapor or two-thirds per cent. by volume of the gas so recorded is aqueous vapor taken up by the passage of the gas through the water.

The following is one way to cut a bottle in two: Turn the bottle as evenly as possibly over a low gaslight flame for about ten minutes. Then dip steadily in water; and the sodden cooling will cause a regular crack to encircle the side at the heated place, allowing the portions to be easily separated.

A thick solution of merine glue in wood naphtha is a good cement for fixing glass letters. The glass must be chemically clean and must be previously scrubbed with soda, then with whitening and water, followed by thorough rubbing.

That singularly limpid oil drawn from the jaw-bones of black fish, which is used by watchmakers the world over to oil the works of watches, almost all comes from Provincetown, Mass., though the total consumption is only 200 gallons yearly.

Good Health.

Dust as a Cause of Catarrhal Affection

This is beginning to be recognized by the members of the medical faculty. Some years ago the present editor of the *Artizan* contributed to some journal, the name of which he cannot now recall, the result of his experience with acute attacks of inflammation of the nasopharyngeal membrane, affirming his opinion that city dust caused this inflammation in many instances. His attention was attracted to this subject from the great relief he experienced through short voyages at sea, and the recurrence of the attacks upon his return to the city at a time when the streets were exceptionally dusty.

Dr. W. H. Bennett, of New York, has contributed to the September number of the *Medical Record* a very able essay upon abnormal conditions of the superior air passages and some of the causes of chronic inflammation of these parts, in which he ranks dust as one of the most efficient causes. He thinks he has proved satisfactorily that chronic catarrh may be produced by the action of dust, through experiments upon animals forced to breathe air which contained no more dust than is frequently seen in air in certain parts of the business portions of New York. Dust issuing from the registers of houses heated by hot air furnaces, and dust of streets—which is a combination of nearly all substances, filthy and otherwise, known to mankind—he regards as more effective in producing these complaints than clean earth dust and dust occurring in various manufactories. It seems certain that chronic catarrh is more provalent in cities than in country districts. Dr. Bennett estimates that at least four or five out of every twelve in the city of New York, irrespective of their calling or profession, suffer from chronic inflammation of some part of the respiratory membrane situated above the trachea. Naso-pharyngeal catarrh, he states, is extremely prevalent among the conductors of the city horse cars, and this disease is always aggravated when the streets are dry, and the consequent amount of dust dragged after the cars is excessive.—*American Artizan*

The Duration of Life.—According to an eminent German authority, the average duration of life among the upper classes of ancient Rome was thirty years. In the present century among the same class of people it amounts to fifty years. The same authority says that in Geneva at the present time, as many people live to seventy years of age as three hundred years ago lived to the age of forty-three.

Disease From Soap.

The Pittsburg *Leader* has a notice, gathered from French medical papers and confirmed by physicians of New York, regarding diseases propagated by the free use of soap. The prevalence of diphtheria among washerwomen first drew attention to the matter; and chemical investigation traced the disease to the soap. It is well known that domestic soap fat is foul stuff. It is long gathering; putrescence usually sets in before it gets into the boilers of the factory. Fat that comes from dead animals goes to the soap boiler. Often the animal was diseased and always it is tainted with mortuary matter.

Continual rubbing in hot water, causes absorption of the poison through the pores of the skin, and it attacks the most susceptible organs. Lung fever and kidney diseases are traced to this morbid source in such a way as to leave no doubt. Many diseases of children are caused by impure soap.

The Commission in Paris reports this poison most apparent in toilet soaps, and those most scented are the worst. Probably the rosin so much used in common laundry soaps has a counter effect. For it is found that borax freely used counteracts the baneful effects of the poison.

The report states that soap gains greatly in detergent power by the addition of borax, and on this account it is common to advertise soaps as enriched in that way. But of twenty samples analyzed scarcely a trace of borax was detected.

It recommends a law requiring that a certain minimum proportion, not under ten per cent. of the alkaline ingredient, shall be obligatory in all soaps. And, further, that the proportion be stamped on all soaps, under fine and forfeiture for deception.

Borax is plentiful on this coast, and so much reduced in price that it may now be used freely.

Vaccination and Re-Vaccination.—Dr. John Aikman, in the Glasgow *Medical Journal*, for April last, gives the results of a careful study of two hundred cases of re-vaccination. The epidemics in London and Glasgow during 1871, to an absolute certainty, showed that no case of small pox has occurred in a person successfully re-vaccinated with primary lymph. Primary vaccination, though most effective in *modifying* the disease, is not to so great an extent a preventative as once believed. This modifying influence of vaccination is strikingly shown by the author's observations. Of two hundred and seventy children admitted to the small pox hospital for varioloid, three per cent. died, while of two hundred and thirty-one unvaccinated children admitted to the same ward for small pox, forty-eight per cent. died. By the study of the two hundred and seventy cases, it further appears that the physiological changes attending the second dentition have some effect in destroying the preventive effect of previous vaccination. Of two hundred cases, one hundred and seventy-five were successfully re-vaccinated. Thus it appears that a large proportion of the community considered vaccinated *are liable to a further protective measure.* Re-vaccination is necessary more frequently during then after the period of youth. Conclusion, vaccinate early, and repeat the operation as long as it will take. Re-vaccinate at eight, sixteen and twenty-four years, and (says the author) your patients will never have small pox, or severe varioloid disease.

Internal Use of Sea Water.—The experiments of Dr. Lisle, as recorded in a late number of the *Bulletin General de Therapeutique*, have led him to the conclusion that, besides being an useful purgative, sea water acts as an alterative in all such cases as are benefited by saline mineral waters like those of Nanheim, Soden, Homburg, etc. He finds that its continued use increases the appetite, facilitates digestion, quickens nutritive changes, and augments the proportion of red corpuscles in the blood. Accordingly he recommends it (1) during convalescence from acute diseases; (2) in the apyretic forms of dyspepsia; (3) in neurosis associated with impoverishment of the blood; (4) in the scrofulous and tuberculous diathesis; (5) in diabetes. Sea water may be agreeably administered in bread, in the form of a syrup, or in that of an elixir. Bread made with sea water can only be procured at the seaside; it is very palatable, and contains nearly five grammes of the mineral constituents of the water in each pound. The syrup is prepared by mixing 250 grammes of sea water with a sufficiency of sugar and distilled water to make 500 grammes. Each tablespoonful of the syrup contains about twenty-five centigrammes (3¾ grains) of the saline residue of sea water; from two to five tableepoonfuls may be taken daily. The formula for the elixir is: sea water, 200 grammes; rum, 200 grammes; sugar and distilled water up to 500 grammes. The dose at first is a tablespoonful three times a day.—*Boston Jour. Chemistry.*

Whooping Cough.—Wilde says that he can cure every case of hooping-cough within eight days by the following treatment: The patient is not to leave the room, and at every accese of coughing is to hold before his mouth a small piece of cloth, folded several times, and with a teaspoonful of solution; ether, sixty parts; chloroform, thirty parts; turpentine, ten parts,—*Atlanta Med. Jour.*

Domestic Economy.

Kitchen Furniture.

Never have dark furniture for a kitchen. It shows the dust much more than light and requires double the care. Never have extra shelves or mantels painted dark if you can help it. If it is your misfortune to have dark painted furniture, wipe it once in a few days with a damp cloth, and have it varnished often. Have your sink in a convenient place, but never under a window if you can avoid it, as much work is caused by greasy dish-water spattering upon the windows as it necessarily must. Back of your sink nail up a piece of varnished paper, and then you can with a wet cloth remove all spots that would soon spoil wall-paper. If you are so fortunate as to have a sink room, have it papered and then well varnished; in this case every spot can be easily wiped off. The sink should be lined with zinc, nailed only around the edges, as nails upon the bottom rust and wear through, allowing water to run under the sink, thereby causing the boards to rot.

Good zinc can be kept nice and bright by scouring every week or two with sand, and rubbing all over once or twice a day with soft soap, scalding and wiping dry.

At one side have a place to put the water pail on, which always keep covered day and night; an uncovered water pail is a slack thing. Nailed upon the back of the sink, have a little box perforated through the bottom, to keep hard soap in, and if you have no better place, castile soap and a piece of pumice stone to remove stains from your hands. Your soft soap keep under the sink, which we take for granted is boarded up, with a door where you put your pets and kettles, board to scour knives upon, sand, etc., and this place should be kept as your sitting room. Just over the sink have a narrow shelf with holes through, to set your common tumblers upon when washed and rinsed, that they may drain and dry, thus saving the time and labor of wiping them with a dry cloth.

At the other end of the sink, put up a narrow strip to set your kettle crickets on; of these you should have two, one to set your kettles on when washing and cleaning them, and and which should be kept under the sink, in some odd nook—the other should be smaller, and only be used to set the kettles upon, when filled, and therefore must be kept handy and clean so if you should be sick with a headache, pain in your side, or any little trifling thing, and should ask your kind husband to fill the tea kettle, he would take the cricket down to set it on, instead of setting it on the sink—thus causing you more labor than it saves. He would be sure to do this were the cricket under the sink, or so black and nasty he could not touch it without soiling his hands.

And last but not least, have a light rack made of strips of wood an inch wide, an eighth of an inch thick and a foot long nailed over one another, making a rack a foot square, with both sides alike, to put in your sink to turn dishes upon while washing, thus keeping them from touching the sink liable to be greasy and dirty, and draining them so that they will wipe easily.

You may think, dear reader, that it takes considerable to furnish a sink to suit our taste; but every one of these things are around our sinks, and no one would we dispense with, neither will you, after having seen how convenient they are.—*Manufacturer and Builder.*

Reform in Cooking.

The British people have evidently taken hold of the cookery reform in their usual solid way. The recent annual meeting of the National Training School of Cookery was held at Stafford house, the residence of the Duke of Sutherland, and was well attended by "the nobility and gentry." The Princess Louise was present, and the Duke of Westminster took the chair. The secretary's report showed that the school had been in operation since March, 1874; 765 pupils have passed through it, of whom 108 have presented themselves for examination and have obtained "learners' certificates." Three have obtained full diplomas as teachers and remunerative employment.

The lady superintendent of the school, Lady Baker, has announced her resignation, being about to leave England. A beginning has been made in teaching cookery in elementary schools, and Sir H. Cole announced that the Committee of Council of Education have ordained that every girls' school wherein the pupils pass an examination in "food and its preparation" and in "clothing and materials" will receive an addition to its annual grant.

In training colleges also throughout the country the practical teaching of cookery will now, to the extent of two-thirds, be paid for by the State. One speaker said that he had lectured in Cambridgeshire, where a farmer complained that he would make the men unwilling to work by showing them how to live on four pence a day. With this example in England, training schools for cookery will doubtless soon become numerous and fashionable in this country.

Graham Cup Cake.—Unbelted wheat meal, two cupfuls; buttermilk, one cup; molasses, half-cup; butter, quarter of a cup; eggs, two; soda, half a teaspoonful. Bake half an hour.

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper inserted at special rates.

SUBSCRIPTIONS payable in advance—For one year, $4; six months, $2.25; three months, $1.25. Remittances by Registered letters or P. O. orders at our risk.

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus and terms of subscription.

San Francisco:

Saturday Morning, Aug. 28, 1875

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Percentage of Gold; Colorado Scenery, 129. The Financial Situation in San Francisco; The Colorado School of Mines; Short Lectures on Patents; Stocks on the Board, 136. Gypsum; Patent Applied For; Bark Lice; Treasure Troving; The Microscopical Society; Make Your Ideas Public, 137. Microscopic Examination of Minerals; General News Items, 140.

ILLUSTRATIONS.—Crystal Falls, Valley of the Yellowstone; Apparatus for Sampling Ores, 129. Oyster-Shell Bark Louse, 137.

CORRESPONDENCE.—Tasmania, 130.

SCIENTIFIC PROGRESS. — Preservation of Plaster Casts by Paraffine; A Beautiful Experiment in Instantaneous Crystallization; The "Life" of Submarine Cables; Terrestrial Magnetism; The Nutrification of Arable Earth; Deviation of the Compass; The Discovery of Photosulphide of Carbon; Edgerton's Oxy-Hydro-Carbon Light; Tempered Boracic Acid, 131.

MECHANICAL PROGRESS.—Something New in Cannon Manufacture; The Danks Puddling Furnace; New Process for Smelting Iron; Economic Use of Coal; Steel Making Among the Hindoos; The Iron Horse for Street Cars; The Strength of Wood and the Efficiency of the Axe; Iron Making in Japan; To Preserve Metallic Sodium, 131.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board; Notices of Assessments; Meetings and Dividends; Review of the Stock Market for the Week, 132.

MINING SUMMARY from the various counties in California and Nevada, 133.

USEFUL INFORMATION.—Artificial Down and Cloth from Feathers; Brightening Iron; Insect Intelligence; Silvering Natural Leaves and Flowers; Treating Chromos; To Oil a Belt; Marine Aquariums; To Remove Kerosene Oil from Carpets; Testing Portland Cement; Benefits of Competition; Water in Gas Meters, 135.

GOOD HEALTH.—Dust as a Cause of Catarrhal Affection; The Duration of Life; Disease from Soap; Vaccination and Re-Vaccination; Internal Use of Sea Water; Whooping Cough, 135.

DOMESTIC ECONOMY. — Kitchen Furniture; Reform in Cooking; Graham Cup Cake, 135.

MISCELLANEOUS. — Merchant Marine of the World; The Black Hills—What Professor Jenney Found There; Early Mention of Petroleum; The Lightning Mail Train; Eel Skin Lacing for Belts; American Association for the Advancement of Science; The Lake Superior Silver Mine Again, 130. The Navigator Islands; A Bonanza in Mexico; The Invention of the Flat-Footed or Tee Rail; Artesian Water in Kern County; The Bird Question; An Oyster's Heart; A Pretty Idea, 134. Industrial Items, 140.

Monthly List of New Scientific Books.

[Published the first issue in every month.]

AUTHOR.	TITLE.	PRICE.
Andre, G. G.,	Practical Treatise on Coal Mining	$2 00
Birch, S.,	Egypt: Ancient History from the Monuments	1 00
Darwin, Chas.,	Insectivorous Plants, 2 vols	4 00
Darwin, Chas.,	Descent of Man, (new edition) 1 vol.	3 00
	Architecture, A Manual for Churches, Parsonages and Schoolhouses	5 00
Prestwich, J.,	The Past and Future of Geology	1 00
Richards,	Steam Engine Indicator	3 50
Croll, Sir Jas.,	Climate and Tissue	— —
Warren, Edward S.,	Stereotomy and Stonecutting	2 50
Fresenius	Qualatative Chemical Analysis, translated into the new system	4 50
	VAN NOSTRANDA SOIENCE SERIES:	
	Elementary Treatise on Strength of Beams Under Transverse Loads, by Prof. W. Allen	50
	Water and Water Supply, by Prof. W. H. Corfield	50
	Sewerage and Sewage, by Prof. W. H. Corfield	50

The above list is compiled and the books are for sale by A. L. Bancroft & Co., Scientific Booksellers, 721 Market street, San Francisco.

THE LATE ENGLISH FAILURES.—The London *Mining and Monetary Gazette*, in alluding to the recent failures in England, says: "We have repeatedly said that to a great extent our mercantile houses do not rest on a solid individual foundation, but on the material support they give each other." These suspensions, adds the *Gazette*, have not been brought about by the pressure of dear money, but by virtue of their own inherent weakness and insolvency, with money plentiful and the bank rate at the low figure of three and a half per cent. The undermining causes of the monetary troubles date back several years, and are to be found, especially, in the gradual decrease of the profits in the East India trade, and later in the diminished demand abroad, both in Europe and on this continent, for general products of English manufacturing industry.

The Financial Situation in San Francisco.

Business circles were thrown into a ferment of excitement this (Thursday) afternoon by the report that the Bank of California had suspended payment. On inquiry, it was found that a run was started on the bank about two o'clock, and that at twenty-five minutes to three a check was presented for $5,485, when Mr. Ralston informed the messenger that the bank would cash no more checks to-day. From that time until three o'clock, however, thousands of dollars were received; indeed, the force of clerks was doubled so as to facilitate the receiving of coin. While those who wished to draw entered from California street, express wagons loaded with coin were discharging their treasure at the Sansome street entrance. The coin, however, was not placed at the paying teller's counter, but stored in the large vaults of the bank. Mr. Ralston is reported to have assured the customers of the bank that payment will be resumed as usual to-morrow morning. The faith of its friends in the stability of the bank is unbroken, and we trust that sound reason and wise councils may prevail which will result in the restoring of public confidence to the community. Any person who gives expression to feelings of an opposite character cannot be looked upon but as an enemy to the best interests of the State.

A run was also made on the National Gold Bank and Trust Company, but they paid all demands up to the hour of closing, 4 P. M., and, it is believed, have suffered no serious consequences.

A special meeting of the San Francisco Stock and Exchange Board was held this afternoon, and it was decided to hold no more sessions until public sentiment was in a more composed condition.

Of course at this writing it is impossible to tell what the outcome will be, but we hope for the best.

Later—Since the above was in type it is authoritively reported that the Bank of California will not resume. Mr. Ralston also is reported as saying that depositors will be paid in full. We have neither space, time or inclination to write further now in regard to this financial disaster and its causes.

The Colorado School of Mines.

When Colorado perfects the conditions necessary to elevate her from the minor position of a Territory to a full fledged member of the Federal Union, which will occur during the coming year, she will be christened, "The Centennial State."

That she will add very materially to the wealth and prosperity of her sister States, no one acquainted with her wonderful resources can doubt. With mineral possibilities almost passing the bounds of imagination, she has a climate and soil which seem peculiarly adapted to some branches of agriculture; the stock raiser here finds a most congenial home.

That Colorado is not wanting in enterprise and a will on the part of her people to develop their latent wealth, was called to our mind more particularly at this time by the perusal of a circular of the Territorial School of Mines, at Golden. Practice is combined with theory, and instruction in the field is given to classes, who every term visit and examine in detail the different mills, mines and reduction works that are found within a radius of thirty miles from the school, thus teaching from direct inspection and practical results the several methods used to mine, reduce and manipulate the coal, and variety of ores of gold, silver, copper, lead, iron, uranium, etc., that are mined in Colorado Territory. A completed laboratory with all necessary apparatus, a cabinet of minerals and a collection of fossils are accessible to the students.

A PROSPEROUS CITY.—San Francisco is today the most prosperous city in the world. There is no other to be found where real estate is more active, where more building is in progress, in proportion to the population, or where there is less destitution among the working classes. Our population is increasing at a most unparalled ratio, while the prospect for the future grows brighter and brighter every year. In no other city on this continent, outside of New York, has there ever been such an industrial display as that now to be seen at the Mechanics' Pavilion, in San Francisco. Agricultural industry, manufactures and mines, are the solid basis on which her prosperity rests. She occupies a most commanding geographical point, where the great world lines of travel and traffic necessarily concentrate and diverge, without the possibility of any great rival growing up within a thousand miles' distance. San Francisco is evidently destined to become the great city of the future, and the commercial capital of the most prosperous State in the American Union.

ROOT BOILER.—The attention of steam users is called to the "Root Safety Boiler" (see advertisement on page 141.) The merits claimed for it being safety from destructive explosion, economy in fuel, making dry steam, and the reasonable price as compared with other boilers.

Short Lectures on Patents.

No. 12—By J. L. BOONE, of Dewey & Co's. MINING AND SCIENTIFIC PRESS Patent Agency.

Assignments.

One of the most complicated and at the same time one of the most important questions connected with the subject of patents, is that which relates to the sale, and transfer of patents and interests therein. Few patentees understand the legal forms and requirements connected with this subject, and they are therefore compelled to seek the aid of a lawyer or patent agent in order to consummate a sale. Lawyers as a general rule, unless they are familiar with patent law and the special rules relating to the transfer of patents, are apt to apply the ordinary rules relating to deeds and bills of sale to the transfer of patents, and thus many a sale is rendered imperfect and the purchaser is placed in a position which is liable to defeat his purchase, without recourse. It is, therefore, necessary that not only every patentee, but also intending purchasers should understand at least the principal rules and requirements relating to assignments, so that they may guard their own interests and see that their rights are properly secured.

Any instrument of writing which expresses the intention of the patentee or owner to dispose of his patent or an interest therein to another party, and which specifies a consideration is a legal assignment if it be signed by the party owning or holding the patent or the interest therein which is disposed of, and this instrument need not necessarily be either witnessed or acknowledged. Although such an assignment if properly recorded, would hold the interest disposed of, it is always desirable that certain forms should be used in order to make the sale distinct and intelligible, and there are oftentimes outside conditions which require to be expressed, and these conditions vary according to the nature and surroundings of each case; for instance it is desirable when a person purchases all the right, title and interest of the patentee, to insert a clause in the assignment binding the patentee to sign and acknowledge the necessary documents to obtain a re-issue of the patent in case such re-issue should become necessary or advisable. It is often that such provisions can be inserted in an assignment, so as to avoid much trouble which is likely to arise after the purchaser deems himself perfectly secure. No one but a person who is familiar with the various phases which a patent or an invention can assume can properly throw these safeguards about a purchase, and is therefore important that a person skilled in such matters he employed to prepare the transfer.

When a party disposes of his interest in a patent, his rights in the premises cease entirely. He has no right to manufacture the patented article even for his own use.

When a party has received an assignment of a patent, or of any undivided interest in a patent, he must place the same on record in the United States Patent Office within ninety days from the date of assignment. If he fails thus to record the assignment within ninety days, and the person from whom he purchased should sell the interest to another party who did record within the specified time, the second assignment which was properly recorded, would hold in spite of the prior date of the unrecorded assignment; but if no subsequent assignment is placed on record, even if the first assignment should not be recorded within the ninety days, the holder of the first assignment can then record it and thus defeat any subsequent purchaser who does not record until afterwards. The reason of this requirement is obvious. The Patent Office is supposed to keep a record of the title of every patent, so that any person desiring to purchase a patent can readily find out who the rightful owner is. This record will therefore always give the name of the actual proprietor outside of the ninety days, and a party who purchases in good faith from this record should not be defeated by a purchaser who failed to give notice of his purchase by recording his assignment inside of the ninety days.

The very natural question now arises, what recourse would the proprietor of the unrecorded assignment have against the person who sold the patent or interest in the patent to a second party? I do not know that this question has ever been definitely settled, but it would seem on principle that an action for fraud would lie against the person who sold the same thing twice.

The owner of a patent can sell his right as a whole or he can sell it in subdivisions. He can dispose of one, two or a dozen States or territories to one person and the remainder to another, or he can sell each State to a different person, or he can sell an undivided interest in the patent. He is thus left to dispose of his patent in whatever way he can make it most profitable.

When a patentee assigns *absolutely* a certain territory, he grants to the assignee the same right that he had within that territory, which is the exclusive right to make, use and sell the thing patented; outside of that territory the patentee retains all the rights he had before the sale. The assignee can therefore make, use and sell to others to be used the patented machines within the purchased territory. He is not bound to ask his customers any questions as to where they come from or whither they are going. The purchaser is presumed to know the extent of the sellers right, and if he takes the machine outside of the territory aforesaid, and proceeds to use it, he will be liable to the patentee for damages, because the patentee's right outside of the sold territory remains unimpaired.

It would seem that the law ought to make a distinction between a machine or patented article which is intended for production, and one which is intended solely for consumption. The former is usually intended to accomplish a certain duty in a fixed position, and therefore may be considered permanent in its character, while the latter is transient and generally accompanies the person of the owner. In the absence of any judicial decisions bearing upon these points it is difficult to state any fixed rule, yet we are safe in concluding that the law would not require a traveler to remove a pair of spurs which he had purchased from the owner of a patent right in one State, when he came to the boundary line, which separated the territory of one owner from that of another owner in the patent.

When the owner of a patent sells an undivided interest in his patent to another party, the assignee has a right to manufacture and sell the thing patented wherever he pleases, and in the absence of any copartnership agreement he can make, use and sell as many of the patented articles as he pleased without any responsibility whatever to the other owner.

Stocks on the Board.

Among a certain class of operators the stock on the board is the only one of value whether there is merit in it or not, while stocks off the board are of no value. There is no reason in this estimate of mining interest, and yet all know it is so.

It has only one solution, and that is a base gambling estimate of business. Such being the fact, the result is the boards are being loaded down with trashy stocks to the detriment of those which have merit in them, and the many are fleeced out of thousands to the great detriment of the mining interest. But who shall judge? says one; we will answer, the board. The paying of a few hundred dollars, should not entitle a stock to be listed, and dealt in, to the great discredit of brokers and great detriment if not total loss of capital invested by their customers. Something more is wanted, and that something is a report made in the interest of the board and placed on file for the inspection of the public, and made by an honorable and skillful expert who has reputation to lose.

This being done, then merely holes in the ground would have their value, while mines of merit would rank as such, and possess a value in accordance. The venture of capital in mining is well enough, but that venture should not be in large figures on small shows, and too often no shows at all. The venturous capitalist, too often being drawn in by "manipulation" only. We know this is a hard matter to regulate, but that sooner or later it must be met, we are quite certain.

That there is too much good capital being thrown away, all must admit, and capital which, if judiciously invested, would do a world of good to our coast. There wants to be more legitimacy infused, into our at present speculative city miners, and less of this reckless gambling spirit. Independent of the good to be accomplished in a monetary sense, there would be a good derived in a moral sense, for it is an undeniable fact that we are growing into one of the greatest stock gambling communities, of its size, on the globe. Poor men and rich men gamble; merchants, bankers, manufacturers and mechanics all gamble; women of the parlor and women of the kitchen gamble, men and women, girls and boys, of all conditions, shades and pursuits, hold stocks, and are in for making a pile or lose it all, all on a "big gamble." But, says one, it scatters coin, and nothing is lost to the community. It does scatter coin we know, but it gathers too often from the one who can little afford it, into the coffers of the rich and unscrupulous, who do the manipulating.

Our present stock gambling mania is the grandest scheme yet devised to make the rich richer, and the poor poorer, and much of it may be termed legitimate robbery.

We do not wish to be considered as opposed to mining ventures or stock operations, but we do desire to see more discretion observed in making investments, more money made and less lost for the general operator.

For our California legitimate mining interest, the boards, as things are at present, is a great curse, for the reason that Comstock wild cat on the board, is more available by manipulation than honest mining and genuine merit in our own State. Advice to those who invest, it is clearly shown, by every "big market" and "great decline" is thrown away, and for a better condition of affairs to insure less loss, we must appeal to the boards themselves.

Stock companies are multiplying to such an extent that the boards can afford to reject companies not possessed of meritorious properties and to set values outside of inside manipulations, and by so doing, have a higher estimate given to the name of broker and be of great value to the legitimate mining interest of the whole coast.

Gypsum.

In answer to anqniries from a correspondent iu San Luis Obispo conuty, wa say: California gypsum hos not yet amounted to much in the market. Not that tha country is destitnte of gypsnm of a satisfactory character; for we have good reason to believe that this State has enough, at least for its own use, for fertilizing and all other purposes; but tha strata of good gypsum, as fonud, are in soma instances too thin to work with any profit; and in others too far from shipping points to allow of transportotioa. In this, as in quartz or other ledge mining, it costs ss much to uncover a ledge six inches thick as one measuing twelve feet; and a ledga of gypsum, to work with profit, should messure by feet, not by iuches. Then, as to locality, it will not admit of much hauliog. A prima article of gypsum, in its crude state, is worth but $6 per ton delivered at tho whorfs of San Francisco. It will therefore he seen at ouce that tha strictest ecouomy in handling aud hanliug is indispeusable.

Bnt the greatest drawback to the development of California gypsum is in the worthless character of much that is found here. Mony discoveries of gypsnm strato are being mada in different parts of the State, and parties have in some instances been deludod with the belief that certain strikes of this charscter would develop into something liko booanzas; when, in reolity, they are of no value whatever. We have axamined nnmerous spocimens of this character. They are all gypsum; but the proportions of lime aod sulphur ore so small that it would not poy to work them; and no discreet desler would sell plaster such os this wonld make. A fair percentoge of lime and sulphnr ore essential, whether the plaster is to be used for fertilizing or mechaoical purposes.

Parties, on findiog gypsum strata, should not be carried owoy with the idea that they have strnck a fortune; nor, on the other haud, should they coodemn it until they have hod its merits properly tested. Among the crude speoimens which wa hava seen, the hettor grades were the most uninviting in appeorance, heving a dull, opaque, soft granite sppeerence; while the poorer grades were of a brightar, crystaline appesranco, resembliog the clearer kinds of rock crystals. It is of the first importance, therefore, that people who strike or come iuto possession of gypsum shonld inform themselves ot once in regerd to its compositiou. For the benefit of such parties wa have made some enquiries in relation to this matter; and, on visiting the Golden Gate plaster mills, were assured by the proprietors, Lucas, Gesner & Co, that they would freely give ony information that partiee mey desire on this subject. Having confidence in the members of this firm, both as to the ability or fairness of any advice which they might give in this matter, we would advise our friends to address to them any enquirieswhich they may wish to make. If they ore in doubts as to the composition of any strota of gypsum they shonld send samples to Lucas, Gesner & Co., when they can obtoin this or any other informstion which they may desire on the subject. The address of this firm is Nos. 215 and 217 Main street, San Francisco.

Onr readers need not be told that ploster, or gypsum, is an article iudispensable in many cases, snd is gradually increasing in importauce. In Enropeau and Eastern farming it stsnds at the head of commercial fertilizers, in regard to general adaptotion and reliahility. It needs no demonstration to prove that it is especially adapted to some portions of California. In ranges where bogs prevail they could be mode of vastly more volue hy tho applicotion of plaster to the growiog crops, and we believe the sphere of its usefulness as o fertilizer will be greatly enlarged by experieoce in using it. The article should be "as cheap as dirt"; nothing but handling and transporting it makes it otherwise; and if we con develop available strata of gypsum in our own State, it will prove a source of considerable wealth to the State and a metter of great convenience to farmers.

Patent Applied for. A Hint.—All visitors, on close observation, will notice thot nearly every valuable and recent invention on exhibition in the Pavilion, is marked "patented," or "patent applied for." Mecbanics and inventors shonld take the hint from this fact, and when they contrive or conceive any new and usefnl inveotion, machine, instrument, process or what-not, they should at once apply for a patent thereof, aod thus preserve for themselves, all proper bencfits for their labor, thought and skil. Dewey & Co, at the office of the Mining ann Scientific Press, No. 224 Sansome street, corner of California, possess superior fecilities for securiug patent rights for inventors. Orders for such business may also be left at the stond of the Mechanics' Fair Daily in the Pavilion. We will he happy to give any desired information on this subject to those wishing it. A word to the wise is sufficient.

The Marin *Journal* says that the work on the tunnel through the puerto suello came to en abrupt stop on Saturday night last, owing to indications thet Mr. L. A. Dougherty, the contractor hod left for parts nuknown, leaving no provision for the liquidation of demands for labor, supplies, etc.

Bark Lice.

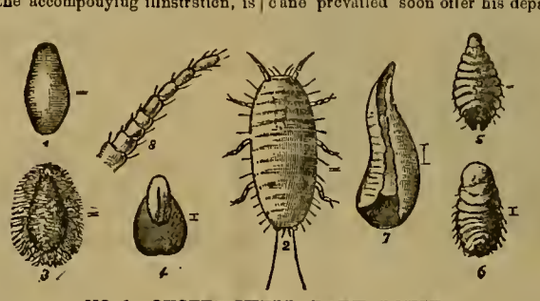
The class of vermin of which we propose to treot to-day is a very disreputsble one. It is not considered o very stroined point of deliecy that prohibits their mention in conuection with humonity, and any intimation of the presence of poultry lice or cattle lice would justly offsnd the careful keepers of fowls aud cattle.

Tho thorough orchardist should manifest the sama sensitiveness in regard to tho mention of bark lice; for their presence is a like indication of nucleanliness in all the situatioos meutioned above. Orchords that are ellowed to run to waste, or that are even kept in gross, receiviug the attentiou thot this crop requires, favor the propagation of these verain; snd the owner of fruit trees who neglects to search tbe crevices of their trunks should not he surprised at as great an excess of populatioa as occurs in these heads:

> "Where horn nor bone does ne'er unsettle
> Their thick plantations."

But if clean cultivotion is given an orchard, and tho trunks are thoroughly washed in spriug with strong soap suds, there will be little or no trouble from bark lice.

The ravages of vermin are not confiued to fruit trees; many of our shade, ornomental ond wild forest trees, even, ara infested with them. In No. 1, of the accompouying illnstrstion, is



NO. 1. OYSTER-SHELL BARK LOUSE.

portroyed on insect which infests tbe apple, pear aud mountaiu esh, ond is occasionally fonnd on the cherry and plum. It is

The Oyster Shell Bark Louse;

The figures hsre giveu beiug highly magnified. Tbe hair lines at tbe sida of each givo the actual length. Explanation of figures: 1, egg; 2, louse when active; 3, louse soon after becoming stotionary; 4, scale in process of formation; 5, louse under scale; 6, seme, somewhat later; 7, a scale viewed from below; 8, antenna of No. 2.

Its presence on trees is manifested by tha many little scales on the twigs ond smsller branches, giving them tha appearonce of Fig. 5. The scales, it will he seen, are elongated, a little curved; they are of a dork gray, almost black color. If when you find one of these scsles on your trees, you lift it and apply a pocket mognifying glass to the eggs there deposited, they will be fouod to be white, oval in outline ond extremely minute, as is seen in Fig. 4.

In early summer these eggs hatch into minute

No. 2. Piece of Apple Tree Bark Covered With Oyster-Shell Bark Lice.

whitish lice as seen in fig. 2, which run about on tbe branches, nsually passing outward to the newer wood. Tbis active period of their lives cottinues for a few days only, not more than a week, when the femsles fssten themselves to some well selected spot on the tree end never again leave it. While in this stotionary condition, the lonse covers herself with a scale from a waxy secretion from her own body, as seen in figs. 3 and 4. During the time this scale is forming she loses her legs and assumes the form of fig. 5; and when the covering is completed she lays three to four dozen eggs and dies.

Thus it will be seen that a remarkably lsrgo portion of its existence is passed in the egg state, and while hid beneath this scaly covering is well protected from its enemies. No. 2 in our illustration represents a piece of applo tree bark covered with these scales.

Harris' Bark Louse,

Commonly called the American bsrk louse, infests about tho same varieties of trees that are visited by the oyster shell species, but is less injurious. Its scales differ from those of the latter, both in shope snd color, being round, flat and thin, ond nesrly white. The eggs are a pnrplish red, as are also the young lice. In their transformations, habits, etc, they very closely resemble the oyster shell species. No. 3 in the accompanying illustratiou shows an apple tree branch with the scales of the Harris' bark louee.

The white willow is infested with an inset which is known as tbe "willow bark louse." Its habits closely resemble those described above, with the exception that it laye a much larger nnmber of eggs and consequently increases in numbers more rapidly. In somo of Esstern States, wbere the willow is extensively grown for hedges and other pnrposes, the damages inflicted by this pest are of qnite a serious character.

All the above varieties of tree-lice attach themselves to the woody parts of the tree; there are, however,

Scale Lice,

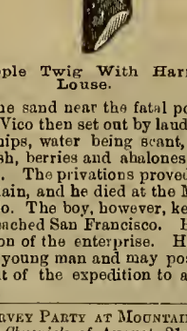
Which take up their aboda npon the leoves of trees which they infest. The pine trea has a parasite of this character, known os the "pine leaf scale." The elm is similarly afflicted with one knowu as the "elm leaf scale."

Among fruit trees, a weak, developed growth is more lioble to attack from bark lice than those of strong, vigorous habits.

Treasure Troving.

Rumors of a Silver Hunling Expedition.

It is rumored that o schooner, formerly employed in the river trade, is fittiug out for a treasure troving expedition to the coast of Mexico. Captoin A——d, well kuown in the South American marine, is soid to be the head of the enterprise, ond will leave in about three weeks for bis destinatioo. Great secrecy is manifested in the affair, but as far ss can ba ascertained a certain officer in the Mexicon service, severol years since, left Loreto with o cargo of silver for Mazatlan; n "cordonazo," or hurricane prevailed soon ofter his departure and it was supposed he went down in the gulf, as nothing wos heord of him or his vessel. But it seems not. He outlived the tempest, and, being driven almost to Cape Palma, ran iuto o cove, where he landed the silver and hid it in hollows along the shore. He then put to sea, bnt his men quarreling, one was killed aud the other thrown overboard by the Captein, who wes thus left with one assistant—a boy named Vico. Being rid of two men he could not trust, ths Captain put bsck, took on board a portion of the silver, and set soil, intending to crawl along the coast to San Franc sco. But as he went ont it fell calm and the launch stranded on a point of rocks, when the swell soon broke her up. The silver, however, was got ashore and



No. 3. Apple Twig With Harris' Berk Louse.

buried in the sand near the fatal point. The Captain snd Vico then set out by laud, enduriug great hardships, water being scant, the heat great, and fish, berries and abalones their only nourishment. The privations proved too much for the Captain, and he died at the Mission of San Fernando. The boy, however, kept on, and ultimately reached San Francisco. His story is the foundotion of the enterprise. He seems to be a reliable young man and may possibly lead the fitters out of the expedition to a bonanza. *Nos veremos.*

Coast Survey Party at Mountain Peak.—The Alpine *Chronicle* of August 21st, says:—W. Einheck, T. J. Lowery snd party, United States coost surveyors, last week visited Stanislaus peak snd made observotions in running the connecting line from the Pecific to tha Atlantic coast, and this week they ore at Round Top monntain, Hopo valley. They report that Stanislaus peak is 11,740 feet above the levol of the sco, aud situated at the head of Stonislaus river, thirteen miles distant from Silver Mountain peak. The party will return to this section next spring, with an increased force, aud Si ver Mountain peak will be the base of operations. The work will be carried on with the most improved instruments—hemisphere transit, theodolite, heliotrepe, etc. The heliotrope will be statiooed on the peak.

The Microscopical Society.

The regular meeting of tha Ssn Fraacisco Microscopical Sociaty was held on Thursday last, with President Wm. Ashburner in the Chair. In addition to tha members, Dr. H. P. Babcock, of Ooklond, aud Mr. R. W. Washburn, of this city, were present os visitors.

Dr. S. J. Corbett was proposed for active membership, and Prof. Thomas Price was elected as such.

Under the head of donations, the Treasurer announced that he had received the sum of $50 from Wm. Norris, Esq., ono of the society's resident members, as a contribution toword the library fnnd. The onnouncement wss thankfully received, and a vota of thanks tendered the gentlemon.

Additions to the library wera announced by the Secretary.

The photo-micrographs presented at a former meeting by Col. Woodward, were laid on the teble, bound in a suitable manner, and received much attention from tha members during tha evening.

Mr. Wm. Ashburner donated a slide mounted by him with sond from the north shore of Great Salt Lake, which he stoted were porticles of corbonate of lime deposited round a nucleus, probobly orgsnic.

Mr. J. P. Moore donated three slides mounted by him, both dry, *in situ* and in bolsam for the polariscope, with the cuticle of *Eleagnus Japonica variagata*, showing stellate hairs of peculiar chorocter.

Mr. C. G. Ewing presented a slide mounted with a species of weevil known as *Sitona lineatus*, and Mr. W. A. Woodward mode a further dooatioa to the eotomological portiou of the cobinet of a number of pear slugs and grope vine beetles, which were referred to Mr. Edwards for investigation ond report.

Mr. Donalian, of Heeldsburg, presentad whot was said to he a variety of *filaria* found in the water, at that place.

Mr. Mellville Attwood presented o nuuiber of slides monnted with sections from several gold-hearing veins of California, accompanied with a very interestiug paper which will he found in enother column.

The Advance Silver Mining Company.

This is the nome of a company recently incorporated in this city to work the Esmersldo ledge, the first and most important location mode in Monitor mining district, Alpine county, Californie. This ledge is about fifty miles south of Virginis City in a formatiou of quartzite and porphyry. The outcroppings are a mixture of quartz, clay and silver ore, assaying an average of about $40 a ton in silver. In the early days of Alpine a tuonel was run a distsnce of about 800 feet, cutting the ledgs 150 feet below the surface, aud showing a well defined vein, twelve fest wide. From the level of this tunnel a shaft has been sunk 150 feet exposing a large body of ore, sufficient of whicb wss worked ot the Monitor mill, on East Corson river, to prove its vslue; the lot worked yielding over $1,500 in silver, above 900 fioe. We learn that the present company have purchesed a Diamond drill of A. J. Ssverance, Esq., and commenced to sink a first-class working shaft from the surface, and propose to erect heistiog works of the most substantial character, with sufficient power to keep the mine frea of water, snd to sink to any required depth. The work will be done in the best msuner and, prosecuted with the utmost dispatch. All who have examiued it, concur in the opinion that this is one of the largest and most voluable mines east of the Sierras, and the present managers are songuine it will soon rank amoog the hig paying mines of the conntry. The company is composed of men of ability, capital aud business enterprise, who will prosecute the work of development with energy and industry.

Make Your Ideas Public.

The casual visitor, in looking over the mony objects of interest at the Fair, may sometimes think of some valuable suggestions in the way of improvement or variety. If each one who is impressed with an idea of this kind will either make nse of it himself, or *herself* (I emphasize the latter, for many voluable inventions have been made by ladies), or tell or write about it in such a way that it will be made known to tl e world, one of the most important uses of tbe Fair will not he lost. Do not refrain from writing for feor that your idea is not worthy of such prominence, or from sensitivencss with reference to baving your views in print or consigned to the weste bsske t. It is an easy matter to present your article to an editor without moking your nsme known to him, by sending it by a friend, without signatare, or with a *nom de plume*.

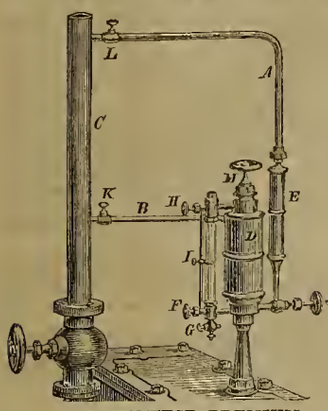
Your frieud con send by mail, stoting that the responsibility is assumed by her or him, and giving signature and address, as editors have good reasons for refusing articles not vouched for by some one. An idea may be sent direct to an editor without signaturo, with request to him to write the subject up if deemed valuable.

Those who poesess intelligence and inventive faculty, or, in fact, usetnl gifts ot any kind, should consider themselves in duty bound not to hide their light under a bushel, and should be careful lest they egotistically foar to appear egotistic.

If a men or woman knows somethiug usefnl, impart the knowledge to the world,

Machinery.

N. Seibert's Eureka Lubricators.



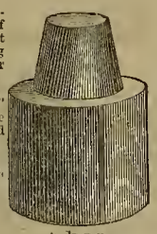
THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe O; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted t give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S F. 24v23

STEEL SHOES AND DIES

FOR QUARTZ MILLS,



Made by our improved process. After many years of patient research and experiment we have succeeded in producing STEEL SHOES AND DIES for QUARTZ MILLS, which are uncqualled for *Strength, Durability* and *Economy.*

Die. Shoe.

Will wear three times longer than any iron Shoes.

BUILDERS AND CONTRACTORS

Of Quartz Mills, Pans, Separators, Concentrators, Jigs, Hydraulic Rock Breakers, Furnaces, Engines, Boilers and Shafting, and General Mining Machinery in all its details, and Furnishers of Mining Supplies.

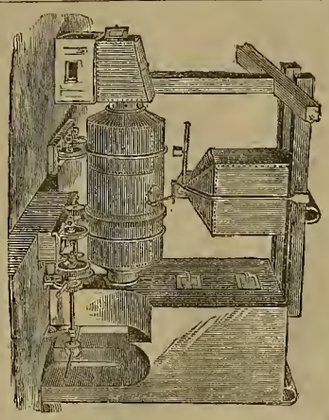
TEATS' PATENT FURNACE.



TEATS' PATENT FURNACE

For Roasting, Desulphurizing, Chloridizing and Oxidizing Ores, etc. For the reduction of Gold, Silver, Lead and other ores, saving a larger percentage, at less cost, than any other invention now in use. Chloridizing Silver ore more thoroughly, in less time, with less fuel, salt and labor; also roasting Lead ore preparatory to smelting, better and cheaper than any other invention. The Furnace is so constructed that one man, of ordinary ability, tends five or more furnaces; controls them with ease; adding heat or air; stopping or starting at will; charging and discharging with ease. Also, Patent "Conveying Cooler," for conveying and cooling roasted ores, heating the water for amalgamation and the boilers at the same time. Saving the large space in mill (covered with brick or iron), and the labor of two men per day, exposed to the poisonous chlorine gases. Also, Patent Air Blast "Dry Kiln," for drying ores direct from the mine or breaker, saving fuel and labor heretofore necessary in drying ores for dry pulverizing. For description refer to Mining and Scientific Press, No. 18, October 31, 1874. For particulars address

D. B. MILLER & CO.,

No. 12 West Eighth Street, Cincinnati, Ohio

Circulars, &c., will be furnished, if required.

Improved Cast and Forged Steel Shoes and Dies for Quartz Mills.

[PATENTED MAY 26TH, 1874.]

Price Reduced to 16 Cents Per Pound.

SAN FRANCISCO, November 10th, 1874.

To Supts. of Quartz Mills and Mining Men generally:

We take pleasure in stating that owing to the rapid increase in our orders, our Pittsburg Manufacturers have been compelled to add largely to their works—a new gas furnace and heavier trip hammer—and are thus enabled to reduce the cost of steel and at the same time produce SHOES AND DIES superior to any yet manufactured. We have consequently reduced the price to 16 cents per pound and solicit a trial order, guaranteeing that you will find them at least 10 per cent. cheaper than the best iron. There are no STEEL SHOES AND DIES made excepting under our patent and sold at this office, or by our authorized agents, though certain Eastern manufacturers advertise STEEL SHOES AND DIES which are only cast iron hardened by the addition of a composition. They will not out-wear two sets of common iron, though called steel. They are very brittle and are not capable of being tempered, flying from under the hammer like cast iron. Our STEEL SHOES AND DIES are in use in many of the largest mills on the Pacific Coast, and all who have tried them pronounce them cheaper and far superior to iron in every respect, even at the old price of 20 cents per pound. Their advantages over iron are cheapness on first cost, increased crushing capacity, time saved in changing and in setting tappets, increased value of amalgam by absence of iron dust and chippings, and a saving of 75 per cent. in freight. It takes 60 days to fill orders from the manufactory East. Price 16 cents per pound shipped at San Francisco. Terms liberal.

Address all orders, with dimensions, to W. A. Townsend, Secretary.

MILL MEN.

Wanted, by a thoroughly practical mill man, a situation as First Engineer, Foreman, or General Manager. Is an engineer and machinist by trade, and has a fair knowledge of assaying, melting, etc. Apply to A. M. KRUTTSCHNITT,
North C and Mill streets, Virginia City, Nevada

Microscopic Examination of Minerals.

Mr. Melville Attwood, of this city, has devoted much time and attention during the past two or three years to the microscopic examination of ores and minerals. Micro-lithology is comparatively a new branch of science, yet one which has already yielded much valuable and practical information, and forms a study which has evidently a promising future.

At the meeting of the Microscopical Society of this city, held on Tuesday evening last, Mr. Attwood made a very valuable donation in the shape of twelve slides mounted by him with sections of the wall rocks and "horses" of principal gold bearing veins of California, accompanied by the following paper on

Micro-Lithology.

The rock sections which I now present to the Society are from specimens taken from the wall rocks of some of the principal gold hearing veins of California.

In order to examine them I found it necessary to prepare and cut the sections myself, in consequence of which they are not so well done, or mounted, as I could wish; yet sufficient to show structure and composition.

Those that would admit of it are cut thin, to enable me to make the full use of transmitted light in their investigation, as I found that the mere inspection of the outer surface, as an opaque object, did not give the information that examination by transmitted light affords.

I believe the microscopic examination of the wall rocks of gold bearing veins is something new, and for that reason I have brought the subject before the Society, hoping by such means to draw attention to it, and perhaps indnce some one more competent than myself to carry out the investigation.

So little is really known of the origin of our metalliferous deposits, that anything tending to throw light on the subject is important, and should be interesting.

Many of the specimens from which the sections are cut are, to the naked eye, a compact and homogeneous mass, and appear to be formed of different constituents; hut after being cut to the requisite thinness, and placed under the microscope, I found them all of the same structure and composition.

I have little doubt but that after a time, by the aid of the microscope, the miners will be able to distinguish the wall rock from intruded masses (commonly termed *horse*) in the metalliferous veins, which, in too many instances have puzzled the most experienced, and thereby led to great waste of time and money.

Section No. I. Is from the hanging wall of the Eureka vein, Grass Valley, at a depth of 480 feet.

No. II. Hanging wall of the Eureka vein at a greater depth.

III. Wall rock of the Sierra Buttes mine.

IV. Wall rock of the Indian Valley mine.

V. Wall rock of the Norumbago vein, Grass Valley.

VI. Wall rock of a large vein near Grass Valley.

VII. Wall rock of a large vein near Nevada City.

VIII. Wall rock of a large vein near Mokelumne Hill.

Many of these are diorites, consisting of felspar and hornblende, with crystals of pyritic matter; the fibrous structure of the hornblende being distinctly visible. I found the pyritic matter in every case which I examined to have gold mechanically combined with it. The eruptive basic rocks, to which this class belongs, all possess the same general structural features, which serve to distinguish them from all others. The mineral parts of such rock are seen to be developed in more or less perfect crystals, at all angles to one another, thereby indicating that the entire mass must have been at one time in a state of liquidity, or solution (aqueous or igneous), sufficient to allow of that freedom of motion absolutely essential to such an arrangement of the particles.

Section No. IX. From the hanging wall of the Hayward mine, Sutter Creek, at a depth of 1,000 feet.

X. Hanging wall of the Oneida vein, Sutter Creek, at a depth of 800 feet.

The structure of these sections very much resemble those from the wall rock of the celebrated St. John del Rey vein, Brazil.

XI. Is a section of the Killas or wall rock of the St John del Rey vein, Brazil.

XII. Section from a "horse" in the Eureka vein, Grass Valley, at a depth of 400 feet.

The result of my examination of the wall rocks, as far as I have gone into the matter, in a great measure confirms the views of Mr. David Forbes, expressed in a communication to the British Association in 1865, "On the Appearance of Gold in the Earth's Crust,", and in a short abstract on the same subject, but of late publication, he says:

"With regard to the time of introduction of gold, or rather auriferous eruptive rocks, into the crust of the earth, a continued study of the subject, and the collection of more data from other parts of the world, not only confirms me in the views expressed in a communication to the British Association in 1865 (a short abstract of which is given in the *Geological Magazine* for January, page 23), but makes me further believe the views therein expounded to be of universal application, and—

§ bearing in mind that any bed of sedimentary origin may contain fragmentary debris of any auriferous eruptive rock or vein substance which was of previous geological age—

I am of the opinion that gold is not in itself characteristic of any sedimentary stratum or formation, and when found in such beds, introduced otherwise than stated in the proviso §, that its presence there is due to subsequent intrusive causes.

"My researches have led me to conclude that, universally, gold has been introduced into the crust of the earth at two very distinct geological epochs, and that in both these cases it has been carried up in direct consequence of, and in conjunction with, the outbursts of distinct and characteristic plutonic rocks."

I hope at a future meeting to have a few sections from the wall rocks of some of the silver bearing veins of Nevada; also, sections of the intruded masses termed "horse."

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington D. C., August 24th, 1875.

Canadian Patents for Pacific Coast Inventors.

Following is a list of inventions patented in Canada by inventors in the Pacific Coast States and Territories, from January 1st to June 30th, 1875:

CAR AXLES.—H. H. Rhodes, San Jose, Cal.
SEWING MACHINE.—H. P. Garland and A. J. Gove, S. F., Cal.

*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

General News Items.

A BOTTLE containing a note signed by Donaldson has been found, washed ashore near Port Hope, Michigan. It says: "Over Lake Michigan, at 8 P. M. of the evening of starting; about 300 feet high. A gale is coming from the northeast. The balloon is getting out of order, and the gas is escaping fast. Cannot remain up much longer; will surely drop in the lake. It is a fearful storm." No trace of the missing aeronant's body has been discovered.

THE American rifle team met with a magnificent ovation on their return home. They arrived in New York on Saturday evening last, and on Monday the formal reception at the City Hall, a fine military display and a banquet in the evening attested the warmth of public sentiment over their splendid victory.

THE investigation into the terrible condition of the crew of the English ship *Brenen* on her arrival in this port is now going on here. From the testimony of the Captain it would appear that a veritable plague broke out, and the wonder is any of the crew survived.

THE Congress of German Journalists at Bremen, has adopted resolutions, asking Imperial legislation in behalf of the liberal press to publish truthful reports of the public proceedings of law courts, and granting immunity from a disclosure of names of contributors.

THE Secretary of the Treasury has addressed a letter to the Committee on Investigation of the Chicago custom house job, urging them to cause an early completion of that building.

A SPECIAL dispatch from Vienna says the eldest son of the Sultan of Turkey is going to Croatia with a squadron, to prevent the threatened insurrection there.

JACK FROST has been nipping the corn stalks in Wisconsin.

ROBERT BONNER, of New York, has purchased the famous seven year old trotter, "Grafton," from Richard Penniston, of Lexington. He made a trial at Cleveland in 1:15½. The price is not known, but it is said to be $15,000.

THE foot and mouth disease has broken out with great violence in Dorsetshire, England, where 12,000 animals are down with. The distemper is spreading rapidly.

THERE is ample assurance now that the cars will be running from San Francisco to Los Angeles by the 1st of July next.

KING ALFONSO of Spain is to marry the daughter of the Duke of Montpensier.

AN educational convention of colored men is in session in Richmond.

BONNER paid $25,000 for the new trotting wonder, Grafton.

CARDINAL MCCLOSKEY is in Paris.

THE "HOUSEKEEPER" OF OUR HEALTH.

The liver is the great depurating or blood-cleansing organ of the system. Set this great housekeeper at work, and the foul corruptions which gender in the blood and rot out, as it were, the machinery of life, are gradually expelled from the system. For this purpose Dr. Pierce's Golden Medical Discovery, with small daily doses of Dr. Pierce's Pleasant Purgative Pellets, are pre-eminently the articles needed. They cure every kind of humor from the worst scrofula to the common pimple, blotch or eruption. Great eating ulcers kindly heal under their mighty curative influence. Virulent blood poisons that lurk in the system are by them robbed of their terrors, and by their persevering and somewhat protracted use the most tainted system may be completely renovated and built up anew. Enlarged glands, tumors and swellings dwindle away and disappear under the influence of their great resolvents. Sold by all dealers in medicines.

"Claude, a child about three years old, was greatly afflicted with sores on his legs and feet, so that he could not wear his shoes and stockings. Had a great deal of trouble with him. Had tried many remedies ineffectually. At last we tried the Golden Medical Discovery, and in about three weeks he was entirely cured, his sores were all healed, and health much improved. Respectfully yours,

J. W. BOYER.

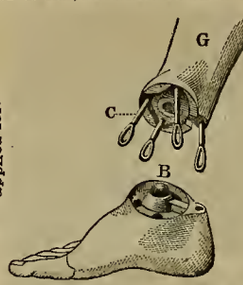
Vermillion, Edgar Co., Ill., Jan. 29th, 1875."
—*Com.*

The Dr. Bly Artificial Limbs

166 Tehama Street,

OOR. OF THIRD, BETWEEN HOWARD & FOLSOM

References to parties wearing these Limbs given when applied for.



The best Artificial Limbs made. Send for descriptive circular.

THE "ANATOMICAL LEG," WITH A UNIVERSAL ankle motion; the above cut is its illustration. This artificial leg approaches so much nearer an imitation of the functions of nature than any other, that it stands without a rival among all the inventions in artificial legs, old or new. (The very latest announced new inventions duly considered.)

Pamphlet containing history and uses mailed free on application, if not found at your druggist's.

POND'S EXTRACT CO.,
New York and London.

TASTELESS MEDICINES.

A prominent New York physician lately complained to DUNDAS DICK & CO. about their Sandalwood Oil Capsules, stating that sometimes they cured miraculously, but that a patient of his had taken them without effect. On being informed that several imitations were sold, he inquired and found his patient had not been taking DUNDAS DICK & CO'S,

What happened to this physician may have happened to others, and DUNDAS DICK & CO. take this method of protecting physicians, druggists and themselves, and preventing Oil of Sandalwood from coming into disrepute.

Phys cians who once prescribe the Capsules will continue to do so, for they contain the pure Oil in the best and cheapest form.

DUNDAS DICK & CO. use more Oil of Sandalwood than all the Wholesale and Retail Druggists and Perfumers in the United States combined, and this is the sole reason why the pure Oil is sold cheaper in their Capsules than in any other form.

Oil of Sandalwood is fast superseding every other remedy, sixty Capsules only being required to insure a safe and certain cure in six or eight days. From no other medicine can this result be had.

DUNDAS DICK & CO'S SOFT CAPSULES solve the problem, long considered by eminent physicians, of how to avoid the nausea and disgust experienced in swallowing, which are well known to detract from, if not destroy, the good effects of many valuable remedies.

Soft Capsules are put up in tin-foil and neat boxes, thirty in each, and are the only Capsules prescribed by physicians.

TASTELESS MEDICINES.—Castor Oil and many other nauseous medicines can be taken easily and safely in DUNDAS DICK & CO'S soft Capsules. No taste No smell

☞ These were the only Capsules admitted to the last Paris Exposition.

Mining and Other Companies.

Gover Mining and Milling Company—
Principal place of business, San Francisco, Cal. Location of works, Drytown, Amador county, Cal.
Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of August, 1875, an assessment of 20 cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company, No. 402 Front street, room 8, San Francisco, Cal.
Any stock upon which this assessment shall remain unpaid on the 10th day of September, 1875, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Thursday, the 30th day of September, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale.
W. O. WILSON, Secretary.
Office, No. 402 Front street, room 8, San Francisco, Cal.

Hope Quicksilver Mining Company—Lo-
cation of principal place of business, San Francisco, California. Location of works, Cinnabar Mining District, Sonoma County, State of California.
Notice is hereby given, that at a regular meeting of the Board of Directors, held on the 2d day of August, 1875, an assessment (No. 2) of Five cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, Room 2, No. 408 California street, San Francisco, Cal.
Any stock upon which this assessment shall remain unpaid on the 9th day of September, 1875, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Thurday, the 30th day of September, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale.
JACOB HARDY, Secretary.
Office, Room 2, No. [illegible] California street, San Francisco, California.

Manhattan Marble Company of Californ-
ia. Location of principal place of business, San Francisco, California. Location of works, Oakland, Alameda county, State of California.
Notice is hereby given, that at a meeting of the Directors, held on the 6th day of August, 1875, an assessment (No. 8) of five dollars per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary of the company, at his office, Nos. 13 and 15 Fremont street, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 15th day of September, 1875, shall be deemed delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 4th day of October, 1875, at 12 o'clock M., to pay the delinquent assessment, together with costs of advertising and expenses of sale.
L. L. ALEXANDER, Secretary.
Office, Nos. 13 and 15 Fremont street, San Francisco, California.

Mount Auburn Gold Quartz Mining Com-
pany. Location of principal place of business, San Francisco, Cal.
Notice is hereby given, that at a meeting of the directors, held on the 25th day of August, 1875, an assessment (No. 1) of twenty-five cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, No. 402 Montgomery street, room 9, second floor.
Any stock upon which this assessment shall remain unpaid on the 27th day of September, 1875, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Thursday, the 28th of October, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale.
C. A. JAMES, Secretary.
Office, 402 Montgomery street, room 9, San Francisco, California.

Orleans Mining Company—Location of
principal place of business, San Francisco, Cal. Location of works, Grass Valley Mining District, Grass Valley, Nevada County, Cal.
Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 23d day of July, 1875, an assessment, No. 6, of one dollar per share was levied upon the capital stock of said company, payable on the 23d day of July, 1875, in gold coin of the United States of America, to the Secretary, at the office of the company, room 8, No. 315 California street, in the city of San Francisco
Any stock upon which said assessment shall remain unpaid on the 24th day of August, 1875, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 13th day of September, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

OF ALL KINDS.

Fremont Street, bet. Howard and Folsom,
SAN FRANCISCO.

Empire Foundry,

Nos. 137, 139 and 141 FREMONT STREET, SAN FRANCISCO,
RICHARD SAVAGE, Proprietor.

Heavy and light Castings of every description. House Fronts, Mining and General Machinery estimated and constructed at shortest notice. On hand the celebrated Occident and French Ranges, Burial Caskets, Grates and Fenders, Road-Scrapers, Hydrants, Tuyere Irons, Ploughwork, Sash Weights, Ventilators, Dumb Bells, Gipsies, Ship Castings, SOIL PIPE of all sizes, Fittings and Cauldron Kettles in stock at Eastern rates. SHOES and DIES a specialty. Ornamental Fences in large variety. 4v30-1yr.

STEAM ENGINES AND BOILERS

Of all sizes—from 2 to 60-Horse power. Also, Quartz Mills, Mining Pumps, Hoisting Machinery, Shafting, Iron Tanks, etc. For sale at the lowest prices by
10v27tf J. HENDY, No. 32 Fremont Street.

RISDON & TOWER,

MANAGERS OF
Pacific Boiler, Sheet Iron, and
WATER PIPE WORKS.

All Kinds of Boiler and Sheet Iron Pipe.

High and Low Pressure Boilers Built and Repaired.

We refer to twenty years' experience in the above business as a guarantee that all orders for work will be faithfully executed.

OFFICE AND WORKS, 118 & 120 FREMONT ST.,
Bet. Mission and Howard, San Francisco, Cal.

J. N. RISDON, formerly of Coffee & Risdon and Risdon Iron Works.

CHAS. TOWER, formerly Foreman of Coffee & Risdon and Risdon Boiler Works.

Brass Foundry & Pump Factory.

A. J. SMITH, Plumber,
Sole Proprietor and Manufacturer of the
Celebrated Hudson Force Pumps, Atwood & Bodwell Windmill Brass Pumps, Smith's Copper-Lined Pumps, Plumbers' Force Pumps.
☞ Special attention paid to Brewers', Distillers', Beer and Hot Liquor Pumps, and Wine Pumps. Particular attention paid to AIR PUMPS, also to
DIVERS' SUBMARINE PUMPS.
Artesian Well Pumps Made to Order.
☞ Brass Castings Made to Order.
No. 222 FREMONT STREET, - - SAN FRANCISCO.

California Machine Works,

119 BEALE STREET, SAN FRANCISCO.
BIRCH, ARGALL & CO.,
Builders of QUARTZ, SAW AND FLOUR MILLS
Keating's Sack Printing Presses,
THE ECONOMY HYDRAULIC HOIST FOR STORES,
And General Machinists. 25v28-3m

CALIFORNIA BRASS FOUNDRY,

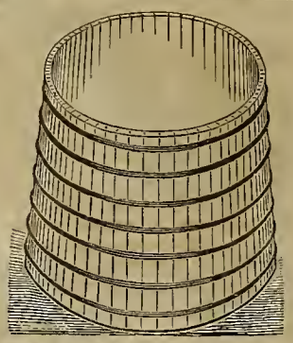
No. 125 First street, opposite Minna,
SAN FRANCISCO.

ALL KINDS of Brass, Composition, Zinc, and Babbitt Metal Castings, Brass Ship Work of all kinds, Spikes, Sheathing Nails, Rudder Braces, Hinges, Ship and Steamboat Bells and Gongs of superior tone. All kinds of Cocks and Valves, Hydraulic Pipes and Nozzles, and Hose Couplings and Connections of all sizes and patterns, furnished with dispatch
☞ PRICES MODERATE. ☜
J. H. WEED. V. KINGWELL.

Miners' Foundry and Machine Works,

CO-OPERATIVE,
First Street, Howard and Folsom, San Francisco.
Machinery and Castings of all kinds.

McAFEE, SPIERS & CO.,
BOILER MAKERS
AND GENERAL MACHINISTS,
Howard st., between Fremont and Beale, San Francisco



WATER TANKS of any capacity, made entirely by machinery. Material the best in use; construction not excelled. Attention, dispatch, satisfaction. Cost less than elsewhere.
WELLS, RUSSELL & CO.,
Mechanics' Mills, Cor. Mission & Fremont Streets,
3v28-3m-sa

Fire Brick.

Addington's Celebrated Fire Brick—warranted equal to the best imported. The public are respectfully referred to the following gentlemen, who have tested them for three and four years, with entire satisfaction: C. H. WEST, C. O. M. Co., Michigan Bar, Sacramento Co., Cal. NELMER TURNER, Clerk at Amador Q. S. Mine, El Dorado Co., Cal. J. B. PHELPS, Contractor, Jackson, Amador Co., Cal. Agents for Addington's Fire Brick and Sewer Pipes.
B. F. HOOK, F. F. MYERS,
No. 1 Front St., cor. Market, S. F. Third St., Oakland.
A. M. ADDINGTON'S POTTERY, Michigan Bar, Sacramento County, Cal.

Glasgow Iron and Metal Importing Co.

Have always on hand a large Stock of
Bar and Bundle Iron, Sheet and Plate Iron Boiler Flues, Gasand Water Pipe, Cast Steel, Plow and Shear Steel, Anvils, Cumberland Coal, Etc.
WM. McCRINDLE, Manager, 22 & 24 Fremont St., S. F

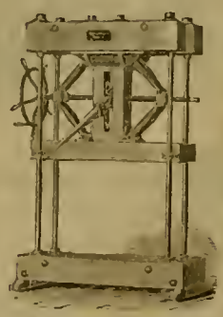
Nos. 9 and 11 FIRST STREET, - - - - - San Francisco, Cal.,

DEALERS IN ALL KINDS OF NEW AND SECOND-HAND MACHINERY.

Hawkins' Blowers and Exhaust Fans.



BOOMER PRESS;
For Wine, Cider Lard E::

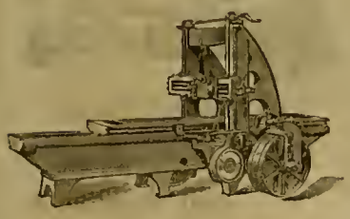
DOUBLE-ACTING PLUNGER,

1,000 Feet Single Lift Guaranteed.

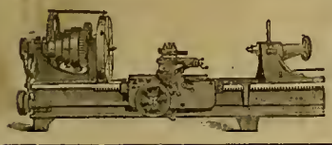
THESE ARE THE ONLY PUMPS ARRANGED TO WORK NOISELESSLY AND WITHOUT ANY SHOCK OR JAR ON PUMP OR PIPES
THESE FEATURES GUARANTEED

Waters' Patent Governor.

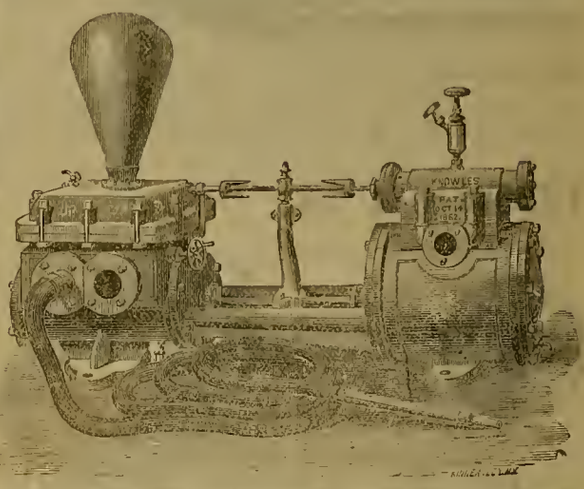
Clapp & Jones' Steam Fire Engine.



FERRIS & MILES'
Lathes, Planes, and Machinists' Tools.

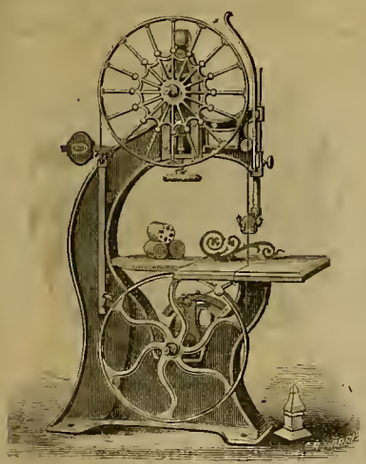


FERRIS & MILES'
Steam Hammers.



Knowles' Steam Pump; for all purposes where Pumping is required.

PACIFIC MACHINERY DEPOT,



H. P. GREGORY, Nos. 14 & 16 First Street,
P. O. Box 168. **San Francisco, Cal.**

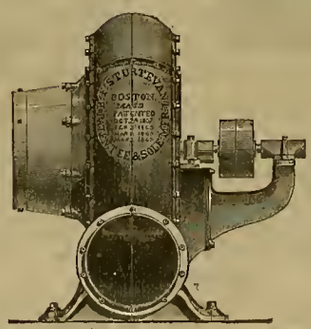
SOLE AGENT FOR THE PACIFIC COAST FOR

J. A. Fay & Co's Wood-working Machinery,

Blake's Patent Steam Pumps,

Tanite Co's Emery Wheels and Machinery,

Fitchburg Machine Co's Machinists' Tools,



Sturtevant Exhaust Fan for Removing Shavings and Sawdust from Machines.

Sturtevant's Blowers and Exhaust Fans,

J.A. Roebling's Sons Wire Rope,

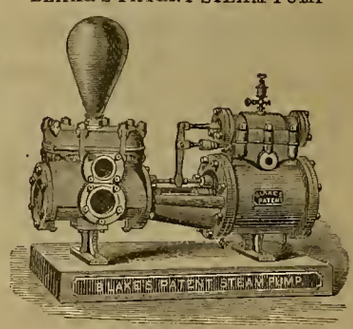
Pure Oak Tanned Leather Belting,

Perin's French Band Saw Blades,

Planer Knives,

Nathan & Dreyfus' Glass Oilers, and Mill and Mining Supplies of all Kinds.

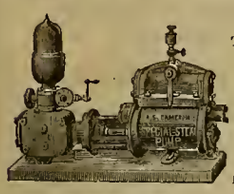
BLAKE'S PATENT STEAM PUMP



Over 7,500 in Successful Use in the United States.

MACHINERY DEPOT,

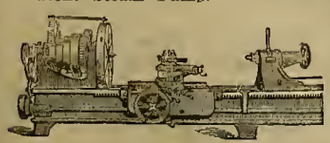
NEYLAN & YOUNG, - - Proprietors.



CAMERON'S
Patent Steam Pump.

CAMERON'S PATENT STEAM PUMP,
THE SIMPLEST, CHEAPEST, AND BEST PUMP IN USE FOR ALL KINDS OF WORK.

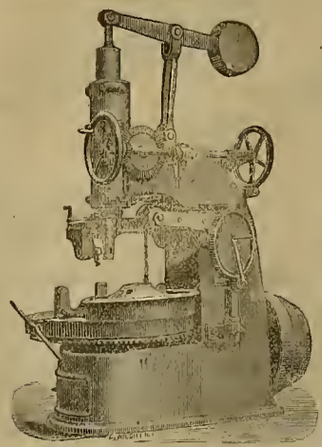
PICKERING'S PATENT
Engine Regulator, Stop Motion and Speed Adjuster,
HAS NO EQUAL FOR ALL KINDS OF ENGINES.
Every Governor Warranted.



New Haven Manufacturing Co's
MACHINISTS' TOOLS,
FROM ENTIRELY NEW AND EXTRA HEAVY PATTERNS.
Those Tools are not surpassed by any other makers.
Send for Price List.

Patent Engine Regulator

NEYLAN & YOUNG, Agents, - - - 18 and 20 Spear St., San Francisco.



No. 4 Car Wheel Borer.

NEW-YORK STEAM ENGINE CO.
MANUFACTURERS OF
MACHINISTS' TOOLS
OF ALL DESCRIPTIONS.
CHAS. A. CHEEVER, TREAS. GEO. Q. DOW, SEC'Y. No. 98 CHAMBERS ST. NEW-YORK

We have the best and most complete assortment of
Machinists' Tools
In the Country,
Comprising all those used in
MACHINE, LOCOMOTIVE, AND R. R. REPAIR SHOPS.

N.Y. STEAM ENGINE CO. We make Without Charge For Patterns, GEAR WHEELS, with our Patent Moulding Machine. 98 CHAMBERS ST. N.Y.

For Photographs, Prices and Description, etc., address
NEW YORK STEAM ENGINE CO.,
98 Chambers Street, New York.

MINING AND MILL MACHINERY.

HOISTING AND MINING ENGINES.

We have all sizes of COOK, RYMES & CO.'s Celebrated Hoisting Engines. These Engines are well known from Alaska to Mexico, and need no recommendation from us. They are made of the best material, and have been lately greatly improved with large drums and link motions.

—OUR—

DOUBLE-DRUM MINING ENGINE,

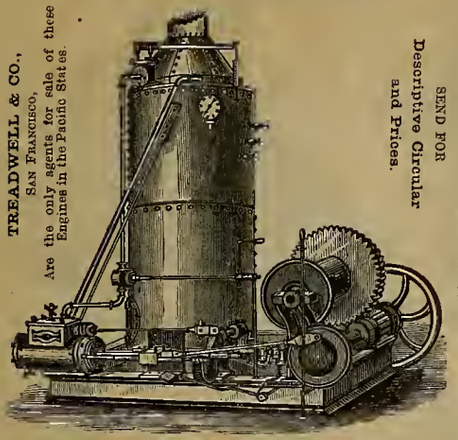
MADE BY SAME PARTIES, IS THE MOST COMPLETE HOISTING RIG EVER INTRODUCED TO THE MINES OF PACIFIC COAST. THE PLANS AND SPECIFICATIONS WERE MADE BY ONE OF THE FIRST MINING ENGINEERS AT VIRGINIA, NEVADA. THESE ENGINES MAY BE SEEN IN SUCCESSFUL OPERATION AT THE FOLLOWING MINES, IN VIRGINIA OR GOLD HILL:

Ophir, Belcher,
Chollar, Con. Virginia,
Europa, Niagara, Leviathan,
Phil. Sheridan, No. Con. Virginia.

☞We have three sizes of these Mining Engines, and are prepared to fill orders at short notice. Prices and full information sent on application to

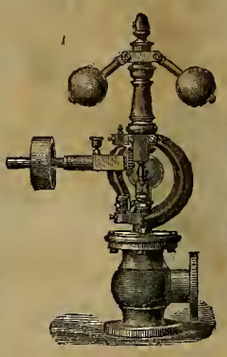
TREADWELL & CO., San Francisco, Are the only agents for sale of these Engines in the Pacific States.

SEND FOR Descriptive Circular and Prices.



COOK-RYMES HOISTING ENGINES,
5½x12—6x12—7x12—8x12—9x14,
Always on hand, with or without reverse motion, either horizontal or upright cylinders, and with or without trucks.

Gardner Automatic Safety-Stop Governor



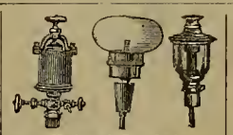
Send for Circular and Price List of this Celebrated Governor.

WOOD-LIGHT MACHINISTS' TOOLS.

IRON LATHES, PLANERS, DRILLS, BOLT CUTTERS, SHAPERS, ETC.

TREADWELL & CO., - - - MACHINERY DEPOT: Market, Head of Front Street, - - - San Francisco.

ASHCROFT'S
Steam Gauges.
The very best in the country. A large stock at reduced prices.



Nathan & Dreyfus'
Self-Oilers and Cylinder Cups.

Belting
MUNSON'S BEST.
A Large Stock Always on Hand.

Our Upright Safety Engines 'Are the Best.
All sizes.

For Sale only at TREADWELL & CO.'S MACHINERY DEPOT, San Francisco, Cal.

WIRE ROPE

For Mining, Shipping, and General Purposes.

All kinds and sizes on hand, or made to order; guaranteed of unsurpassed quality, and manufactured of any length. FLAT ROPES, ROUND ROPES and TAPER ROPES, of IRON OR STEEL.

Patent Endless Wire Ropeway

(WIRE TRAMWAY,)
FOR THE RAPID AND ECONOMICAL TRANSPORTATION OF ORES AND OTHER MATERIAL OVER MOUNTAINOUS AND DIFFICULT ROADS.

This system has been in use for over three years, and given thorough satisfaction.

PATENT GRIP PULLEY,
For transmission of power by means of wire ropes

WIRE.

Fencing Wire and Staples,
ALING WIRE,
SPRING WIRE,
GALVANIZED WIRE,
BROOM WIRE,
STEEL WIRE,
COPPER WIRE,
BRASS WIRE,
And Wire of all kinds, on hand or made to order.
SOLE AGENT FOR
Richard Johnson and Nephews' Celebrated Telegraph Wire.
Full stock on hand in hond, or duty paid.

Wire Cloth and Wire Netting.

FULL ASSORTMENT ON HAND FOR ALL PURPOSES, AND
All Kinds of Goods in the Wire Line,
Send for Circulars, Etc., to

Metallurgy of the Copper-Silver Ores of Inyo County—No. 1.

[Written for the PRESS by SAMUEL PURNELL.]

Inyo county, in its central aad southern portions, holds large quantities of silver ores, carrying so large a percentage of copper that they may more properly be called copper ores. As the majority of the mines promise to be permanent in depth, and are rich in silver, it becomes a matter of prime importance that the ores he worked by processes which shall beneficiate them to the best advantage. It is generally conceded by metallurgists that on account of the large percentage of copper, lead, antimony, areenic, irou, etc., which these ores contain, they cannot be economically worked by the ordinary amalgamation process; aad, wherever this process has been tried, it is understood that the result has been a practical failure. It becomes necessary then to inquire for and search after a better plsh, and to find one that will not only be better than any other for ores of good quality, but will allow elso of those abnndant low grade ores, now lying nntonched, to be worked at a fair profit. That snch a result is possible no metallurgiet can donbt. In these articlee an effort will be made te indicate in what direction success is to he expected. The subject will be considered under several heads: 1st, Beneficiation as copper ores; 2d, Beneficiation as silver ores; 3d, Concentration, as auxiliary to each of the former. First, of

Copper Ores.

It will be assnmed that it would not be economical to treet copper ores in Inyo county by fueion; as by reeeon*of the leck of proper fuel, transportation, accees to markets, and ohesp materials generally, it is probable that ingot copper could not be prodaced ehort of thirty cents per pound, while the present value in New York is bnt twenty-two cents. For the same reasons it ie doubtfnl if the copper ores could be profitably run down to matte, with a view to its ehipment and sale. With these viewe of the necessities and conditione for a rational treatment of the silver-bearing copper oree of Inyo, regard will be paid only to their metallnrgy by wet processes.

Nearly all wet copper processee depend on the conversion of the copper into a eoluble eulphate and its eubsequent lixiviation. Among these, the German process of Ziervogel wae long practiced at Mansfield. It depends on the following reactions in a roast furnace, then an ore conteining a mixture of the sulphides of copper, iron, nickel, cobelt, eilver, lead and antimony ie roasted at a moderate heat; the sulphides ere firet converted into soluble sulphatee, and afterwards with increased heet into insoluble oxidee The temperature required for decomposition ie epecific for each metal, commencing with the eulphate of iron, and increasing for the snlphatee of nickel, copper, silver, antimony and leed respectively. It ie therefore theoretically possible by controlling the tempereture to keep some metale in a soluble condition while others are rendered insoluble. These facts have been used heretofore in the metallurgy of copper and silver oree to render the eilver and copper soluble and the bese metals insoluble. In the process of Ziervogel when the copper and eilver are thus converted into sulphates, they are removed from the fnrnace, and the roaeted ore lixiviated with hot water, by which the silver and copper nre diseolved and carried off to the precipitating tanks. The precipitation of the silver in metellic form is accomplished by placing leyers of cement copper and copper bare in a tank and filtering the solution through them. A little sulphuric acid added facilitates the solution and preciaitation of the silver, and preveats the deposition of basic salts of iron. The precipitated silver will be somewhat contamiaated with copper, which can readily be separated by the ordinary refiaing process. The solntion now containing copper is passed to another tank which contains metallic iron, where the copper is preeipiteted in a metallic form. A portion of the cement copper thus obtained is used for the precipitatioa of the next leach of silver. Should the sulphate of iron now remaining in solution have any commercial valne, it may be precipitated as oxide by lime water or carbonate of lime in powder. Under some circumstances it would doubtless be profitable to smelt this oxide to metallic iron in a shsft furnace for precipitation purposes in subsequent operatious; or it mey be valuable as a flux iu the fusiou of leed end copper ores.

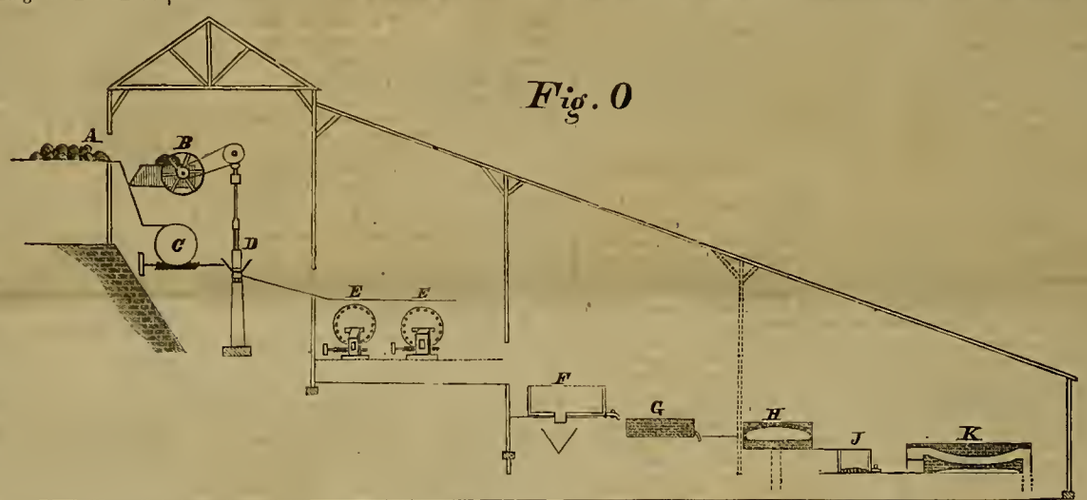

Fig. 0

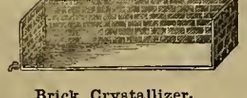
MONNIER COPPER PROCESS.

The roasting in this process is extremely delicate, and herein is its principal defect. If it is not conducted by ekillful men with the utmost eere it may proceed too far aud the sulphates turned into insoluble oxides and the valueble metals thus lost. The process, aleo is not well edapted to ores containiag much arsenic, antimony, lead or zinc, as it is difficult then to roast the copper aud silver to a close percentage in a soluble form; it is also too expensive. It is not at present used anywhere for ores direct, but only for secoudary products such as epeiss end matte.

Fig. 1.



Brick Crystallizer.

Monnier Copper Process.

To meet the above named difficnities in the roasting to sulphates, and in the subsequent precipitetion to avoid the use of the expensive metallic iron, Mr. Alfred Monnier eome yeers ago invented a beautiful method of working copper ores, which has been introduced at a number of eetahliehmeuts with considerable euccess. It ie adapted to the treetment of a wider renge of ores than the process of Ziervogel; and is prohably one of the few copper wet processes which will prove practical and economical iu the working of the complex ores of Inyo county.

The Monnier process consists, substentially, ae follows: 1. calcination of the metallic eulphides with a portion of sulphate of soda, or other eimilar salt. 2. Lixiviation of the calcined ore. 3. Evaporation and crystallization of the sulphates. 4. Redaction of the sulphate of copper. 5. Smelting into ingot copper. 6. Amalgamation of any gold residuum. The working details are eubstentially as follows: The ore is mixed with sulphate of soda and crashed fine enough to pass through a No. 24 screen. It is next roasted in a muffle furnace or a revolving cylinder furnace; the sulphur will begia to burn within an konr after the introduction of the ore, and after that time but little fuel is needed until toward the end of the roasting. Sulphuric acid is formed by the oxidation of part of the sulphur, while the larger proportion of the sulphur escapes as sulphurous acid. The iron, copper and silver are converted by the sulphuric ecid into sulphetes, and the sulphate of soda into a bi-sulphate. Soon all the sulphur not combined with the soda or metallic oxides is expelled. A low red heat is now reached, and the snlphates of iron and copper snffer decomposition. The sulphuric acid at first combined in this form has been stored up, and is now evolved by the greater heat. Being nascent, its combining power is of intense activity and force, and it attacks any and all metallic oxides or sulphides remaining uncombined, convertiag them with greet rapidity into sulphates. The copper and eilver present are eoon converted into eoluble sulphates; iron oxide and gold remaining unconverted and insoluble. In this latter stage of the roaeting the value of the sulphate of soda becomes apperent; it holds faet to the excess of sulphuric ecid formed during the eerly stege, and carries it on to thie critical point. While by other methode of roasting to sulphates, only a portion of the metals are retained es sulphates and the belance is reduced to an insoluble form, by this method the acid is retained until required by the copper and silver when it is given np at the right time, and those metals are recovered with great ease. If the saving of the sulphuric ecid evolved ehould be of consequence, the gases from the furnace mey he led into the usual leed chambers.

Fig. 2.

Evaporating Furnace.

The roested ore is next placed in tanks and lixiviated with cold water. The nse of hot water is to be avoided, as it would dissolve a greater quantity of base metel sulphetes, notably those of lead and antimony. The leaching water highly charged with copper, silver and soda eulphates is conducted into tanks containing cement copper, on which the silver is precipiteted in a metallic form as cement silver, whence it may be recovered by the usual methods.

The large amount of sulphate of soda present in the liquor mnst now be recovered and regenerated for future operetions. To effect this, the solution is run into crystallizing tanks, and left for eeveral days, when most of the soda will crystallize out. See Fig. 1. The crystallization is interrupted before the sulphate of copper begias to deposit; and the solution is run into an evaporating furnace. See Fig. 2. In this, the hearth, is a wooden box lined with lead; *a* is the flue. This is only moderately heated. It receives a steady supply of liquor to maintain a constant level. In this furnace the sulphates of soda and copper as they crystellize are raked out, while the final charge is evaporated to dryness. Some sixty per ceat. of the sulphate of soda origiaelly present is obtained from the first crystallizatiion, which, as soon as it is drained and dried, is ready to go the round ageia. The forty per cent. balance is not lost, but it is recovered in a following operation.

The dry snlphates of copper and silver are next mixed with charcoal and heated in a reverberatory furnace. As soon as fluidity is attained, sulphurous acid is evolved. The mixture is gradually heated to redness, at which temperatnre it is kept until all the sulphnrous acid is expelled. The sulphate of soda remains undecomposed, and the snlphate of copper is converted into mixture of red oxide and metallic copper.

The calcined mixture when cold, is washed in a tank of water, where the unburned coel and sode are easily separated. The soda being again in solution may be run into a crystallizer and completely recovered. The copper is now ready for the refiniag furnace, which refining does not differ from the ordinery process. Fig. 1. In this engraving, *A*, represents the ore; *B*, Blake crusher; *C*, cylinder ore drier; *D*, stemps; *E E*, Bruckner cylinders; *F*, lixiviator; *G*, crystallizer; *H*, evaporating reverberatory furnace, end view; *I*, washing tank; *K*, reducing furnace.

The plent for the Monnier process costs but little. Probably no establishment for the working of complex copper ores could be built on any other plan with a less amount of cepital. About a week is required for the passage of the ore and producte through the various operations. It is estimated that ingot copper can be produced iu a works of this neture from a ten per cent. ore for five cents per pound; which is considerably eheaper than by the English or German plans of fusion. Very little skilled lebor ie required. The use of metellic iron for the precipitetion of the copper ie avoided by the use of sulphete of soda and the method of reducing the sulphate of copper. The soda is need continually with but very little loss. Wear and teer are very smell, as only low heats are required. The process enables all the valuable metals in the ore to be extracted, while the sulphur can be converted into enlphuric acid. The concentration of poor oree is not so obligatory as in the fasiou processes, and poorer ores can be worked. Dnring the roasting it is probable that e double salt of eods and copper is formed, which helps to keep the copper in a soluble form. The weehed copper has almost the exact appearance and richnese of cement copper precipitated by metellic iron, and undergoes the same epecies of refiniug. The actuel coneumption of sode does not exceed one per cent. for each operation. The loss of copper is not more than five per cent., and may be even less with good management.

A weak point in the Monnier process, as well as in some others, is that it requires considerable fnel to eveporete its solutions, and in a country where fuel is high priced and inferior, that may be a serious dissdvantage. Bnt, however that may be, it is probeble thet where the ores are rich enough to hear beneficiation by eny process that nothing has ever been discovered, which will do its work cheeper and cleaner then the process of Monnier, just described. Its only rival in this field is the newly invented Hunt & Douglass process, next to be noticed.

[To be Continued.]

The Transit of Venus—Results Obtained from the Astronomical Observations.

The observations of the transit of Venus for the purpose of determining the true distance of the sun from the earth, for which costly expeditions were last year equipped and sent out by most of the civilized nations on the globe, do not now promise to correct materially the information before possessed. Just what the expeditions did accomplish, so far as the labors of the American observers are concerned, is given in a statement made by Prof. Harkness of the Naval Observatory at Washington, which a *N. Y. Times* correspondent lately obtained. The following is the statement of Prof. Harkness:

As yet it would be premature to attempt to state definitely what has been accomplished by the transit of Venus expeditions; but the subject has so much intrinsic interest that a brief survey of it cannot be otherwise than attractive. We will consider only the American expeditions, of which there were eight. Those in the northern hemisphere being stationed at Wladivostok, Siberi ; Pekin, China, and Nagasaki, Japan; and those in the southern hemisphere at Kerguelen i land; Hobart Town and Campbell Town, Tasmania; Queenstown, New-Zealand, and Chatham island.

Many of these are such out of the way places that the question naturally arises how came they to be chosen? The answer is simple. To see the whole transit each observer had to be so situated that the sun would be above his horizon all the time that Venus was on its disk. This limited the stations to a region which may be defined generally as comprising Asia and that part of the Pacific ocean in which the Australian islands lie. Again, the distance of the sun was to be measured by means of a triangle, and to get a long base line it was desirable to put the northern observers as far north, and the southern observers as far south, as possible. Finally, the success of the observations was dependent upon the sky being clear at the critical time, and on that account it was necessary to select those points which usually have the largest percentage of clear weather in December. Upon examination it was found that at the season in question the weather was usually so much better in the northern hemisphere than in the southern that to equalize the chances of obtaining observations in these two regions it would be necessary to send five parties to the southern and only three to the northern one. These were the conditions which led to the choice of the stations already mentioned.

The commission to whom the arrangement of the expeditions was intrusted naturally supposed that on the day of the transit clouds would prevail at some of these places to such an extent as to preclude all observations, while at others the sky would probably be clear enough to permit the continuous observation of Venus during the whole of her passage across the sun. However, these anticipations were not realized. On the contrary, the entire earth seems to have been involved in broken, drifting clouds; and, strangely enough, although all the American stations suffered from them, still there was not one at which some observations were not obtained.

Method of Finding the Sun's Distance.

It will assist us in estimating the value of the results achieved at these stations if we consider for a moment the nature of the problem attacked. If a person sitting at the back of a room looks out of the window he will see the window bar projected against the house on the opposite side of the street. Now, without removing his eyes from the window, let him rise from his chair and the window bar will appear to sink to a lower position on the opposite house. In the same way when Venus was passing between the earth and the sun she appeared nearer the sun's northern limb to the observers at the southern stations than to those at the northern ones. The object of the expeditions was to measure the exact amount of this displacement, and it was proposed to effect this by two different methods, known respectively as the photographic and the Halleyan. To fix our ideas, let us consider only one northern and one southern station. If at both these stations photographs of the sun are taken at short intervals during the whole of the transit they will furnish the means of laying down two paths of the planet over the sun's disc, as seen respectively from the two stations, and the distance between these paths can be measured with very little trouble. This is the photographic method. Again, as the velocity with which Venus appears to move is nearly constant all the world over, it follows that the time occupied in her transit will be a measure of the length of her path on the sun's disc. Hence, if at each station we note accurately the time when she enters on and leaves the sun's disc, we have the means of computing the length of the two paths required, and by laying them down on a drawing of the sun we can find their distance apart as before. This is the Halleyan method. Of course, in the actual use of these methods as many stations as possible are employed, and numerous small corrections have to be taken into account, which make the computation very difficult and laborious. But enough has been said to enable the reader to comprehend the principle of the methods.

The Success of the American Expeditions.

The number of photographs taken was as follows: At Wladivostok, fourteen; at Pekin, ninety; at Nagasaki, sixty; at Kerguelen, twenty-six; at Hobart Town, thirty-nine; at Campbell Town, fifty-five; at Queenstown, fifty-nine, and at Chatham island, eight. That is, there was 160 pictures taken in the northern, 187 in the southern hemisphere, making a total of 350. On the whole, this is a tolerably satisfactory result, especially as the pictures are quite evenly distributed between the two hemispheres; but if the weather had been fine about three times as many would have been obtained. These numbers refer only to pictures taken while Venus was completely within the disc of the sun. In addition, about 250 others were obtained in which Venus appears only as an indentation in the edge of the sun.

The Observations of Contacts.

Before passing to the observations made according to the Halleyan method, it may be remarked that the instant when Venus first touches the sun's edge is technically called the first contact. Passing gradually onto the face of the sun his light finally closes around her, and she appears as a black dot upon his face. The instant when this takes place is the second contact. After traversing the sun's disc, the black dot arrives a second time at his edge, which is the third contact, and finally at the fourth contact it passes entirely off.

The contacts observed at the American stations were as follows: At Wladivostok, the first, second and third; at Pekin, all four; at Nagasaki, the first and second; at Kerguelen island, the first only; at Hobart Town, none; at Campbell Town, the third; at Queenstown, the first and second; and at Chatham island, none. Although both the second and third contacts were observed at two northern stations, still, as this was not done at any southern station, they cannot be used according to the Halleyan method. Fortunately it will be possible to utilize them by employing a somewhat different system of reduction known as Delisle's method. However, the comparative failure in obtaining contact observations is probably not a matter of very serious importance, because the experience of these astronomers, who were favored with the best weather last December renders it at least questionable if the atmosphere of Venus does not impair the accuracy of those observations to such an extent as to render them almost worthless for determining the solar parallax. The preliminary results lately published by the French commission seem to strengthen this view of the case, for, although some of the contact observations give satisfactory values of the parallax, others give values which are evidently quite erroneous.

Importance of the Photographic Method.

Under these circumstances it is not unlikely that the value of the transit of last December as a means of finding the sun's distance will depend entirely upon the accuracy of the results given by the photographic method. Within the last few years a great deal has been written about astronomical photography, but unfortunately the results obtained from actual use of the method have never been so discussed as to show conclusively the degree of accuracy it will afford. It is hoped that the American photographs will give the distance of the sun within 200,000 or 300,000 miles of the truth, but it is needless to deny that the uncertainty of the result may be considerably greater. It will take some months to read off these photographs and submit them to rigorous computation, but until that has been done any opinion as to their accuracy will be mere guess-work.

The Transits of Venus Give Unsatisfactory Results.

For more than two centuries almost all astronomers have held that transits of Venus are by far the best method of determining the sun's distance, but it is at least questionable if this opinion is borne out by the observations made last December. Until then no astronomer of the present age had seen Venus upon the sun's disc, and, perhaps, the very rarity of the phenomenon gave it an importance and enshrouded it with a glamour which was not its own; but now that it has been studied by the aid of all the appliances which modern science can bring to bear upon it, we can form a better estimate of its actual worth. Let us compare it with another phenomenon which occurs somewhat more frequently, and which is also used to measure the sun's distance.

Advantages of the Opposition of Mars.

The planet Mars is nearest the earth when in the position technically known as "opposition," but its orbit is so eccentric with respect to our own, that at some oppositions it is almost twice as far off as at others. It so happens that in September, 1877, an opposition will occur, when its distance from the earth will be almost the least possible, and, of course, this will be a peculiarly favorable opportunity for measuring its parallax, and thus determining that of the sun. This is the phenomenon which we are to compare with the last transit of Venus.

The localities from which the transit was visible were in parts of the world where there are few or no fixed observatories, and consequently the observations had to be made with portable instruments, by field parties sent out especially for the work. No one who has had any experience in such matters needs to be told of the numerous difficulties incident to such expeditions. The opposition of Mars will be visible from all parts of the world, and consequently it can be observed at the fixed observatories with the largest and best instruments known to astronomers. The transit of Venus lasted but little more than five hours, and at any station where the sky was cloudy during those few precious moments the observation was irretrievably lost; but during the opposition Mars will be so situated that he can be observed every night for at least a month, and it is very unlikely that bad weather will prevail at that time. Again, Venus had to be observed upon the face of the sun, which is about the worst possible position for delicate work, because the solar heat generally disturbs the earth's atmosphere so much as to destroy all possibility of fine definition in the telescope; but Mars will be observed at night, when the atmosphere is quiet and everything is in the most favorable condition for good seeing. Thus far the comparison has been entirely in favor of Mars, but in the only remaining point, and it is a very important one, Venus has the advantage. The parallax of Venus at her transit was thirty-three and a half seconds; but, as observations were differential, we must deduct from this nine seconds for the solar parallax, which leaves twenty-four and a half seconds as the angle to be measured. In the case of Mars the angle will be only twenty-three and a half seconds, which is four per centum less than that for Venus; but, unless the photographs of the transit can be measured with very great accuracy, the knowledge we now possess would lead us to infer that this disadvantage will be more than counterbalanced by the other circumstance mentioned above. On the whole, it seems not unlikely that the observations of Mars in September, 1877, will give more accurate results than those of Venus in December, 1874; but this is a state of affairs which could not have been anticipated a year ago; and, moreover, the transit was so important a phenomenon that unless every effort had been made to utilize it to the utmost, the astronomers of this age would not have been held blameless by their successors.

Locomotives for Steep Inclines and Short Curves.

Among the foreign inventions is that of an improved system of locomotives and cars, for the safe and easy ascent of trains up steep inclines, and their facile passage around sharp curves, so as to meet the difficulties usually experienced under these circumstances.

In this arrangement the locomotive engine is coupled to the train, to be hauled up an incline by a rope or chain, which is wound on a drum mounted in the framing of the engine. The axis or shaft of this works horizontally in bearings in the main framing, and is driven or rotated direct or by gearing, as found most convenient, from a separate pair of cylinders, distinct from the usual cylinders which drive the locomotive in ordinary cases; and these separate cylinders are secured to any convenient part of the locomotive. They transmit a rotary motion to the shaft of the hauling drum by connecting rods coupled to cranks secured to the ends of the hauling drum shaft.

The drum or windlass barrel is loose upon its shaft, and is coupled therewith, when required for hauling purposes, by means of a sliding clutch, having projections or teeth, beveled off at the back, these teeth engaging into corresponding holes in the end of the drum. A clutch lever is provided for throwing the hauling drum into or out of action, as required.

On arriving at the foot of a steep incline, the engineer releases the hauling drum on the engine, and without stopping the engine, runs it up the grade to any desired distance. On the engine being stopped, struts immediately come into action and maintain it firmly in its place. The hauling drum is then started by throwing the clutch into gear therewith—the rope or chain having been paid out as the engine ascended—and the entire train, or any part of it, is hauled up by the sole power of the cylinders which work the winding drum.

The struts on the train act to prevent any retrograde motion, when required, or in case of an accident to the hauling apparatus; they also allow the engine to start again without the train to take another length of the incline, and so on, until the complete ascent of the incline has been effected, the train being hauled up by the engine by the aid of the winding drum.

Catalan Forges in New York.—The opinion is entertained, even among the best informed of our iron makers, that the Catalan forge is a thing of the past, and that it certainly could not be found in the United States. But a correspondent of the *Iron Age* assures us that the Catalan forge represents a large manufacturing interest in what is generally known as the Adirondack section of New York. About 40,000 tons of iron are produced annually, which will be sold this year for about two and a half millions of dollars; but even this does not convey an accurate idea of the business interest, as the forge owners manufacture almost everything they use in producing the iron. There are about twenty-five establishments in this part of New York for making iron by this ancient process, and two new concerns have commenced work within the past year.

At the Ophir mine a fine turning lathe and machine shop are in course of erection, both of which will be a vast benefit and saving, both in expense and time, in the way of necessary repairs to the machinery. The erection of the new incline hoisting engine and the new powerful pumping machinery goes steadily forward. Sinking the incline below the 1500-ft level will soon be commenced.

Nebraska Central and Black Hills narrow gauge railway, capital $1,000,000, has been organized in Omaha.

All They Want Is Capital.

Capital, capital, capital, is the cry from all kinds and classes in all communities everywhere. The universal cry is capital, from one end of the land to the other. Everything could be done with it; everything could be undone with it; all sorts of people could be helped or relieved; all sorts of schemes could be floated; all sorts of Utopian ideas carried out; and all sorts of things accomplished. In fact, capital is supposed to be *the* necessity of the age. But unfortunately it is much easier asked for than obtained; and if obtained, much easier spent than increased.

The Inventor needs capital to perfect his invention, or get his patent; and sometimes spends what he gets in foolish experiments. But oftener he gets none.

The Miner wants it to develop his claim or buy machinery. But if it doesn't pan out properly, and fails, it is because he needed more capital and couldn't get it.

The Speculator wants it for "investment" in stocks on which he has a "point" from Mr. Deluge's clerks' friend's next door neighbor's acquaintance. If he loses after getting it, the reason is he didn't have more to make good his margins.

The Manufacturer needs it to enlarge his business and increase his establishment, and half the time branches out on a larger scale than is good for him.

The Merchant wants it to get in a heavy stock, and buy up all of a certain class of goods in the market; and if he fails, it is because for want of *sufficient* capital.

The Farmer wants it to buy more land, which makes him land-poor. Or he wants it so as to hold his crop over until next year, when, if prices are low, he is sorry he had the capital, as the interest and poor market combined set him back two or three years.

The Philanthropist wants it to carry out a scheme of universal brotherhood and wide spread charity (with other peoples' money,) according to his own idea. When spent, he only wants—more—and doesn't get it.

The Railroad men want it, and when they get it, carry out their schemes in such a way as to make the mention of their names a reproach, when before they were respected.

The lazy men want it, to keep from working, and when they don't get it—which they don't—continue to be lazy.

The Ambitious men want it to lift themselves to a position just high enough to make them dissatisfied.

The Newspaper men want it—but *they* never get it.

Everybody wants it—because they haven't got it.

The Capitalist, that mighty man who has it, he wants it, just like the rest—and keeps it.

So after all, capital, when acquired, is not an unmixed evil. All of us were not formed to be capitalists, any more than all of us were formed to be geniuses. Enough is as good as a feast, and we shouldn't be envious of our neighbors with more of the world's goods than ourselves.

The funniest thing is, that people all want this large amount of money called "capital," although they know if they get it they will be called "bloated monopolists," close-fisted capitalists, etc., but they don't seem to mind these consequences at all. In fact the capitalists bear it meekly and never respond. There must be something in the possession of money which makes a man feel so independent that he can afford to be called names. A good many men would let the world call them all the names in the slang dictionary, and any impromptu ones they could invent if they could thereby be possessed of $5,000 or $10,000.

Natural History Specimens.

A new and interesting feature of the Mechanic's Fair in this city, this year, is the representation of Natural History in several of its most interesting branches. In different parts of the building are cases of birds, shells, natural curiosities from the South Seas and elsewhere, and articles of this character too numerous to mention. Especially would we call the attention of the public to the fine display of conchological specimens entered by Messrs. Fisher and Harford. This collection, comprising over two thousand species, scientifically arranged, and legibly labeled, represents the principal features of their conchological cabinet.

We are informed by these gentlemen, that owing to lack of space, a great many families are not represented. The collection contains specimens from almost every part of the globe, viz: the west coast of North and South America; from the Arctic Ocean to the Straits of Magellan, Mediterranean, Europe, Africa, Australia, Tasmania, the Indo and South Pacific Islands, Madagascar, Red Sea, Palestine, the West India Islands, Japan, China, and Eastern North America. More space would have enabled these gentlemen to have exhibited collections of Lower Silurian, Devonean, and Carboniferous fossils, Echini, Radiates, Crustacea and other interesting objects. What there is exhibited, however, will be found of great interest to natural history students and scientists.

Useful Information.

sical Instruments Improved by Use.

ccommodation plays an important part in ical instruments. It is a well known fact t trumpets, before they can be employed in blic performances, must first be blown in, ased, for a considerable time, in order to de- op their full tone action, and make them eeble of being easily blown. In fact, the dening has first to be lessened for the tone rations (or the resistance of the metal to se); and this is effected by putting the metal quently in vibration. A trumpet may also blown out of tune. If, when quite new, it nes into the hands of an inexperienced per- mer, who often blows certain false notes, trumpet is blown out of tune. That is to , the deadening decreases for these particu- notes, so that the trumpet is more easily own into these vibrations, then into others, lch are not so often excited; and it becomes, refore, very difficult for even a practical former to avoid these false tones. It would this case be of no use to diminish the dead- ing of the trumpet metal by a temporary ating, for this process would affect all the es similarly; only correct blowing will bring at the desired result.

A similar experience is had with striaged in- uments. In these, it is not the strings that uire long playing, for their resistance to vibratory motion is (owing to the smallness the mass to be moved) unimportant; but resonence ceases. However excellent the struction of the latter, a long continuance good playing is indispensable for them. is is accounted for by the fact that the good ayer awakens a stronger tone, and so, vibra- ns of greater amplitude; hence, also for ase, the deadening is diminished. Further, excites only a certain kind of overtones, hich determine the "clang color," and for se overtones the deafening is diminished. hrough long rest without use the advantages this playing out are again lost, as the accom- odation also partly disappears through rest. he reason why pianos do not also grow better er long use is due to the fact that the mech- ism of the instrument wears out.

Progress of Flying Machinery.

A new steering balloon by Smitter is being hibited, suspended in the middle of the Alca- r in Paris. The measurement is only 6,000 bic feet, but the balloon is so light that, hen filled with pure hydrogen, it must float. considerable sum of money has been invested it, and great ability has been displayed in the astraction. Although no practicable result open air may be hoped for, it is a wonderful ece of clockwork. In connection with this bject, it is stated that, for several months ast a firm of engineers have been experiment- g privately at the Crystal Palace with an rial steamer of a novel and promising charac- r, weighing 160 pounds. Experiments are ated to have proved the capability of two verti- l screws, each 12 feet diameter, to raise a eight of 120 pounds; the steam engine, with ater and fuel, etc., forming part of the eight so raised to the extent of 80 pounds. he power exerted by it is equal to two and a lf horses. The communication of motion is iven by a vertical axis emanating from the car. —*Nature.*

Mending China Ware.—A very ready and fficient means of mending broken china ware s to take a very thick solution of gum arabic nd stir into it plaster of paris until the mix- ure is of the proper consistency. Apply it ith a brush to the fractured edges of china are, and stick them together. In a few days will be impossible to break them.

In connection with the above we may re- mark that a correspondent of the *Scientific merican* says a pipe may be mended so that it ill stand both heat and water by a mixture ade of glycerine, and enough litharge to form paste as thick as putty. Use while soft.

Why do Kerosene Lamps "Sweat" Oil.—The appearance of oil on the sides of lamps illed with kerosene oil is due to the evapora- ion of the oil drawn up through the wick by apillary attraction while the lamp is not in se, which is condensed in part upon the cold urfaces of the lamp. This is sometimes called "sweating," as though it passed through the ubstance of the lamp. This is particularly oticeable in brass lamps, from the fact that the surface is colder than glass, and hence con- denses the escaping gases more readily.

A Saving of Waste.—It is well known that zinc is very easily lost under any considerable degree of heat, and that hence in stamping sheet zinc in dies, much waste occurs from the small difference between the melting point and the temperature at which sheet zinc should be stamped to get the best effect. To obviate this waste, heat the zinc by dipping in oil at the proper temperature.

The Philosophy of Settling Water with Alum.—The sulphuric acid of the alum unites with the lime held in solution in the water, and forms an insoluble salt which precipitates, and in settling down carries the other impurities with it. The practice is to powder fine about a teaspoonful of alum into the water, and agitate for a minute or two quite briskly by stirring.

Impact.—A correspondent asks the *Scientific American*: "If two engines and trains of equal weight and resisting power, both moving at the same speed, should approach each other upon a level track and collide, would either train prove a greater wreck than if, running at the same speed, it had impinged upon an immovable object? Answer. Either train would have the same effect upon the other as an immovable body; for the reason that, at the time of collision, the motion of each train would be instantaneously arrested. At all events, we are confident that the wreck would be quite as complete in one case as in the other.

A New Source of Caoutchouc.—Just as the world was beginning to be told that the supply of this useful material was about to come short by reason of the destruction of the tree which produced it, and the thriftlessness which failed to keep up the supply by artificial cultivation, we are also informed of the fact that an entirely new source of supply has been discovered in Burmah, in a creeping plant whose botanical name is *Chavannesia esculenta*. The plant is very common in Burmese forests, and is cultivated by the natives for the sake of its fruit, which is said to have an agreeable acid taste, and to mature at a season when tamarinds are scarce.

Steel Pens become softer through use, which involves continual slight changes of form within the limits of elasticity. A similar thing occurs in the seats of iron chairs, formed with tips of wrought iron or steel. They lose their hardness through use, and are ultimately bent.

Mechanic's straight edges and squares are not so apt to warp when made from old saw blades, as when they are manufactured from rolled iron or steel that has not been used since being rolled.

Painting Boats.—Boats should be painted with raw oil. Boiled oil used in the paint is very apt to blister and peel from the wood.

Leather thoroughly saturated with glycerine will prevent, it is said, the passage of gases.

Good Health.

Sore Throats—Interesting Facts.

The following is a short resume of a lecture, recently delivered by a distinguished medical practitioner, in New York:

Cold manifests itself differently in different people. In some it produces fever and pains in the limbs, in others catarrh, in still others sore throats. Whatever part of the system is weakest will be attacked by the cold.

A large proportion of cases of deafness comes from neglected sore throat. This is because of the intimate connection between the throat and the ear by means of the eustachain tube. Hence the importence of keeping the throat in a healthful condition. The tendencies of sore throat are to the worse and not to the better; hence any affection of this part of the body should receive prompt attention. In case of ordinary sore throat, the simplest and best treatment is the wet pack, using a linen cloth wrung from cold water, and over this a knit or crotcheted yard band, four feet long and four inches wide. Apply this two or three nights in succession, unless it is a very serious case, when the pack should be kept on during the day. If taken off in the morning, wash the throat in very cold water, rub dry with a coarse towel and with the hand. This will prevent taking more cold.

Mucous membranes have three kinds of inflammation—catarrhal, croupous and diphtheritic. Everybody knows how the first appears; in the croupous a liquid is poured out which collects on the outer surface of the mucous coat, and forms a membrane which can be peeled off or removed without injury to the mucous coat beneath. In the diphtheritic the liquid poured out infiltrates itself into the mucous membrane, and if forcibly removed leaves the mucous coat raw and sore. Diphtheria is blood poison. The patient complains of feeling stupid; the angle of the throat swells; there is likely to be more or less nasal catarrh; there appear in the throat patches looking like dirty washed leather, which, being removed, leave a raw spot; the odor of this exudation is offensive, but the disease is not usually contagious unless the exudation comes in contact with mucous membrane of another individual. Hence the greatest care should be taken that no towel or drinking vessel or spoon used by the patient touches the lips of any other person. Croup is inflammation of the larynx, and usually attacks the patient suddenly in the night. The membrane is formed in the larynx, is white, and extends each way up and down. In diphtheria it forms in the throat and extends downward.

The food of a patient suffering from diphtheria cannot be too nutritious and stimulating. All physicians agree in this. There is nothing better for the patient than beef tea, made by putting a pound or two of tenderloin into a glass can, or bottle, sealing it tightly and immersing in water, gradually raised to the boiling point, and kept there until the juices of the meat are extracted. Give as much of this as the patient will take. Old sherry is also prescribed as a stimulant by the most devoted adherent to temperance principles.

Imperfections of the Human Eye.

Prof. M'Leod, in lecturing on this subject at the Physical Society, spoke of the chromaticity of the eye, and said there was abundant evidence of the defects of the organ in this respect. For instance, to short sighted persons the moon appears to have a blue fringe. In using the spectroscope the red and blue ends of the spectrum cannot be seen with equal distinctness without adjusting the focussing glass. A black patch of paper on a blue ground appears to have a fringed edge if viewed from even a short distance; while a black patch on a red ground, when observed under similar conditions, has a perfectly distinct margin. Professor M'Leod then explained that the overlapping of images in the eye produces the mental impression that there is no want of achromatism. It is interesting to note that Wollaston considered that the colored bands of the spectrum were really divided by the black (Fraunhofer) lines, and his statement that the red of the spectrum does not appear to have a boundary line "because the eye is not competent to converge the red rays properly," shows that he had very nearly, if not quite, discovered the achromatic defects of the eye. Dr. Young ascribes to Wollaston the merit of having observed that when a luminous point is viewed through a prism, the blue appears to be wider than the red, the eye being incapable of recognizing that the spectrum has the same width throughout its entire length. An experiment was exhibited to show the relative distinctness of a dark line on grounds of various colors. A string or wire was so arranged that its shadow traversed the entire length of the spectrum, which was thrown on a screen by an electric lamp. When viewed from a short distance the edges of the shadow appeared to be sharp at the red end, but gradually became less distinct, until at the blue end nothing but a blurred line remained.

Mental Peculiarities.

The following will explain many of the mental peculiarities which are met with from time to time in almost every community: A correspondent of the *Phrenological Journal* sends to the editor the following statement: "I am troubled with a queer complaint. If I look a door, I stand and question whether it is locked, and go back and try it over and over again. If I fill a stove with coal, I will stand and say to myself 'Is it filled; am I sure it is filled?' and so with much that I do. I cannot believe it is done. I am not yet twenty years old, and am in pretty good health."

To the above the *Journal* replies as follows: "It arises from a want of co-ordination between the two hemispheres of the brain. Some persons seem to possess double consciousness; one hemisphere of the brain acting in favor of a given course, and the other (containing similar organs) leading to or suggesting different action. The eyes and ears do not always report facts alike, and there is, consequently, confusion of vision and of hearing. Spectacles have to be adjusted to different distances to accommodate the sight of the two eyes of the same person. We often have patients whose hearing is acute who complain of hearing voices with one ear when the other ear is not affected by them."

Man's Best Period.—The Jewish *Messenger* thus fixes the supreme period of man's life. From forty to sixty, a man who has properly regulated himself may be considered as in the prime of life. His natural strength of constitution renders him almost impervious to the attack of disease, and experience has given his judgment the soundness of almost infallibility. His mind is resolute, firm and equal; all his functions are in the highest order; he assumes the mastery over business; builds up a competence on the foundation he has laid in early manhood, and passes through a period of life attended by many gratifications.

Catarrh.—A medical authority asserts that the severest catarrh cold can be removed in about ten hours by a mixture of carbolic acid, ten drops, tincture of iodine and chloroform, each 7.5 drops. A few drops of the mixture should be heated over a spirit lamp in a tube, the mouth of which should be applied to the nostrils as volatilization is effected. The operation should be repeated in about two minutes, when, after the patient sneezes a number of times, the troublesome symptoms rapidly disappear.

Croup can generally be greatly alleviated, if not cured very speedily, if the following remedy is applied promptly: Take a knife and grate and shave off in small particles about a teaspoonful of alum; then mix it with twice its quantity of sugar to make it palatable, and administer it as quickly as possible. Almost instantaneous relief will follow.

Bathing and Exertion Good for the Eyes.—William Cullen Bryant has the best eye sight of any man of his years in this city. It is well known that he bathes daily, and goes through sundry gymastics with an invariable regularity, which ensures a remarkably good health. Is there no connection between those habits and the rare strength of his vision?—*N. Y. Letter.*

Lemon Juice in Diphtheria.—Dr. Revillout states that lemon juice, used as a gargle, is an efficacious specific against diphtheria and similar throat troubles. He has successfully thus employed it for over eighteen years.

Domestic Economy.

Information About Yeast.

Prof. C. E. Bessey, of the Agricultural College of Iowa, furnishes the *Western Iowa Journal* the following information with regard to the nature and uses of yeast as employed in domestic cookery. The question asked by the correspondent of the *Journal* are pertinent and important:

1st. Will flour and water fermented, answer the purpose of stock yeast? Yes, but there will be some trouble usually in controlling the fermentation; it requires careful adjustment of heat; with too little it will not "work," with too much it passes beyond the proper point and becomes sour.

2d. If I proceed in the usual manner of making yeast, by scalding flour with water in which potatoes and hops have been boiled, having ready a mixture of flour and water which has been kept at a proper temperature a sufficient time to induce fermentation, and adding this to the former, will it produce ordinary yeast? This would produce good hop yeast, and it would be identical with what is known as "ordinary yeast."

3d. What is the office of the hops? According to the authorities hops do help fermentation to a certain extent, by accelereting the earlier stages of the process. Beyond these earlier stages, hops appear to aid the yeast in remaining in the condition of yeast, and prevent its passing so rapidly into the sour state. Hop yeast will last longer without souring than that made without them. And last, but not least, the peculiar flavor given to the bread by the hops is greatly relished by many people, as appears to be the case with the questioner.

To sum up—yeast is the fermenting, or decomposing condition of starch; it may be made by simply exposing moistened flour for some time to a heat of about 90° Fahrenheit, when it will be found to contain myriads of minute vegetable organisms which contribute to its activity; the process may be hastened in its earlier stages by adding a solution of hops; the yeast is rendered less liable to sour by the addition of hops; and finally the bread made by using yeast containing hops, has for most people a more agreeable flavor than that made by other methods.

Welsh Rabbit.

Messrs. Editors:—Will you please give me a recipe for "Welsh Rabbit' through the columns of the Press. A Lady Reader.

San Juan, Aug., 1875.

Cooked Welsh Rabbit is made as follows: Take old, dry cheese, grate it on a coarse grater, place on a tin plate upon a moderately hot stove, with butter (one pound of cheese, a piece of butter, the size of a hen's egg), warm slowly and stir until the whole is thoroughly mixed. Cooked Welsh Rabbit; grate as above and moisten with wine or brandy.

"Dutch" Cheese.—The process is to set the sour milk on the stove, over a kettle of water, and let it heat up slowly till the milk thickens and the whey is partly separated. As soon as the curd becomes firm enough to handle it is removed and suspended in a cloth or perforated tin long enough to drain off the whey and cool. If for domestic use, it is broken up, and about half as much sweet cream added as originally belonged to the milk, salted and otherwise seasoned to taste with some aromatic, if desired, and either made into hand cakes or packed away in a vessel for use. If for market, the curd is drained and broken up, and salted and seasoned with a little pepper or caraway seed, and a little butter added, so that the particles of curd will adhere, and then molded by hand into four ounce cake or cheeses and placed at once upon the market, where a ready sale is usually found at remunerative prices. The original German practice was to place the hand cheeses as above made between layers of straw, and let them lie till cured, so as to develop some of the Limburger flavor. But the general practice now is to place them upon the the market and use them while fresh, says Arnold in the *Tribune.*

Preparation of Washing Blue.—Twenty pounds white potato starch, twenty pounds wheat starch, twenty pounds Prussian blue, two pounds indigo carmine, and two pounds finely ground gum arabic are mixed in a trough, with the gradual addition of sufficient water to form a half-fluid homogeneous mass, which is poured out on a board with strips tacked to the edges. It is then allowed to dry in a heated room until it does not run together again when cut. It is next cut, by a suitable cutter, into little cubes, and allowed to dry perfectly. They are finished by being placed in a revolving drum, with a proper quantity of dry and finely pulverized Paris blue, until they have a handsome appearance. The cost is about twelve cents per pound.

Grape Sauce.—Let those who have not done so, stew a small quantity of Isabella grapes, adding a little sugar as the grapes become soft. It makes one of the richest and best flavored of sauces. Try it.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

California.

ALAMEDA

The Cumberland Coal Mine.—Alameda county *Independent*, Aug. 28: The vein in the Cumberland mine, near Niles, is about 3 ft 8 in thick. The tunnel runs in 100 ft, and the prospects are so good as to warrant running in 500 ft for the development of the vein and the bringing out of the coal. Parties from San Jose who visited the mine last Tuesday, speak of it in the most flattering terms and estimate its value at a very high figure. The tunnel is going to be pushed vigorously forward, and the enterprising men, who are engaged in the work, feel sanguine of being able to begin shipping coal by next Christmas.

The Black Hawk.—In the Black Hawk mine, the workmen have struck coal after running the tunnel in 380 ft, but this is only a branch vein. The principal vein requires 220 ft more of tunneling before it can be reached. Old coal miners and experts in the business entertain the most favorable anticipations as to the quality and quantity of coal to be found in this mine.

AMADOR.

Dispute as to a Placer Claim.—*Foothill Ensign*, Augt. 27: Work has been brought to a standstill on the placer claim in Sutter Creek, within the town limits, which has been operated by R. Paterson and others for several months past. It appears that the Lincoln and Eureka companies claim the ground under a title raised by the town of Sutter Creek, and have raised the dam just below the place where sluicing has been carried on, thereby flooding the claim and preventing work. The ground is said to be highly remunerative, a large portion of it having never been worked. It is stated to be worth in the neighborhood of $20,000, and litigation is talked of to decide the question of ownership.

Clean-up in the Volunteer.—We learn that the owners of the Volunteer mine, near Jackson, made a clean-up on Saturday last, the result fully meeting their most sanguine expectations. We have not heard the exact amount realized, but we understand that it is sufficient to pay the working expenses, and also for the erection of their small 5 stamp mill. The proprietors are jubilant over their prospects, and are talking of adding another 5 stamps to the mill without delay. Work in the mine has been kept back during the past month, in order to ascertain the result of the first run, but now that the paying character of the rock is a demonstrated fact, work will be pushed ahead with all possible speed.

Maximilian Mine.—Work is still being pushed on this mine, the prospects improve as the developments proceed. They are now drifting on the ledge from the bottom of the shaft, 80 ft deep, and intend to sink shortly to 100 ft, when another drift will be run in a northerly direction. There are over 100 tons of rock on the dump.

Oneida Mine.—We are told by the superintendent that the scarcity of water in the canal is also affecting this mine, the supply being sufficient to run only 20 stamps. The full complement of hands will be kept at work taking out rock, ready for crushing when a full supply of water again becomes available.

INYO.

Darwin.—Panamint *News*, Aug. 25: This district is developing to a most wonderful degree, and we think must soon outrank all the camps and districts in this section of this most miraculous mineral country, if it does not already. They have two furnaces now in operation; that of the New Coso and the other, the Tyler or Union company. The New Coso stock is now quoted at $3.25 in the Pacific stock board. The raw ore turned out averages over $200 per ton, which is certainly immense for argentiferous ores. The latter company turned out 80 bars of bullion a short time since, but finding their furnace of insufficient capacity, they are now enlarging it. We also hear that P. Reddy, Esq., the principal owner of the great Defiance mine, is about to construct a large furnace, and before the snow flies it is believed not less than 10 furnaces will be in operation. Messrs Reddy & Jewett are now in San Francisco, where they have been attending to the incorporation of the Defiance company. They have succeeded in selling stock to the amount of $50,000.

NEVADA.

New York Hill.—*Foothill Tidings*, Aug. 28: We learn that everything about this mine and mill is in splendid shape and that the mine never looked as well as it does at the present time. As the work of exploration advances better prospects are being brought to light and the idea is now general that New York Hill will soon be on the dividend list.

The Pittsburg mine, over at Deadman's flat, is said to be doing well. A recent crushing of 32 loads turned out $2,240, or $70 per load, and the ledge is said to indicate lasting qualities.

PLUMAS.

The Genesee.—Plumas *National*, August 28: On Saturday last we met Mr. H. McCutcheon, Superintendent of the Genesee mine. He informs us that the mill is running steadily on good paying rock, and the prospects for the future are brighter than ever before. Dr. Quinn, the principal owner, is now residing at the mine, having recently erected a dwelling house. Many improvements are also being made in and about the mill. A new five-stamp battery is being added, which will double the capacity for crushing. The Genesee mine has paid steadily for years, and gives promise of being a valuable property for many years to come.

Crescent Mills.—A large body of splendid rock was discovered by the workman on the lower level of the Crescent mine one day this week. We are indebted to Mr. Hallsted for a specimen of the rock, which he picked up in the dump-pile, and which shows the "ore" plenty. The mill and mine are in good condition at present, and we expect to chronicle some good results in a short time. We are glad the old Crescent has fallen in good hands. It is one of the best mines in the county if properly and economically managed.

SIERRA.

New Mill.—*Mountain Messenger*, Aug. 28: Manson & Co. are busily at work on a new ten-stamp quartz mill for Spencer & Brown, of Camptonville, for the Alaska quartz mine at Pike City. This mine paid well some years ago with a little five-stamp mill, and the owners, J. W. Sterrett and others, took out a good deal of money. The mine is worked through a shaft, and when it reached a depth that it required heavier machinery to work to advantage work was stopped, and it has been lying idle since. Mr. Pelton has the contract for putting up the mill which insures its being first-class. We are informed that the rock from this mine always pays handsomely and well, and we see no reason why the present owners, who have plenty of capital to work with, cannot make it pay largely.

SAN MATEO.

A Newly Discovered Mine.—San Mateo *Times*, Aug. 28: Some two years ago a son of Mr. Eikenkotter discovered some indications of mineral wealth upon his father's property. These indications were gradually developed and at present we have a mine in full blast within a short distance of La Honda, turning out ore which assays $30 gold and about $10 silver to the ton. It is owned by Mr. Eikenkotter, of Searsville, and John Crowley, of Redwood City.

SONOMA.

The Great Eastern.—Russian River *Flag*, Aug. 26: The bench of five retorts on the Great Eastern mine, near Guerneville, roasts two tons of ore per day, and is working very satisfactorily. The yield from these retorts for the first month, ending August 23d, was 149 flasks of quicksilver, which, at the present market price, amounts to $7,450. One-fourth of the metal in the flasks is given by the lessee, Tiburcio Parrott, to the owners of the mine, according to the terms of the lease. The principal owners are A. J. and William Zane, Isaac Gunn, Col. R. Abbey and Ransom Powell. The lease, which is to run six years from August, 1874, required that Mr. Parrott should have a furnace in running order within the first year. This furnace is now being built, and will be finished within a few days. It is of a new pattern, called the "rotary furnace," and is designed to roast decomposed ore without mixing it into adobes. The inventor has agreed to run the furnace thirty days and demonstrate it to be a success, or receive no pay for it. It is a popular and well informed belief that the Great Eastern and its mate, the Mt. Jackson, are the best mines in the county.

Chromic Iron.—Sonoma *Democrat*, Aug. 28: We went with an expert last Friday to examine some chrome deposits in this county. They are located on the east side of Dutch Bill canon through which the Cosst narrow gange railroad will run affording a ready means for transportation, and it is believed there is a large deposit of rich ore in close proximity to the line of the road. This will prove an important auxilliary to the support of the road. The chrome deposits are along the hills on the east side of the canon within a mile of the grading now in progress for the railroad. The hills on the west side of the canon and road are covered with a dense forest of the finest redwood in the State—the Moore Bros. tract—extending several miles in the direction of Russian river, to which point, at the mouth of Austin creek, the road is destined to go. At a future time we will have more to say of these chrome deposits, which are no doubt the most extensive in this section of the country.

TRINITY.

Mining Matters.—Trinity *Journal*, Aug. 28: We made a business visit to the Center last Saturday, having but little time to gather items. While there, we learned that work had commenced on a new wagon road from Davis' place to Cinnabar, and that it would be completed this fall. The new owners of the Hawkett & Lytle property have taken possession and intend erecting new machinery and crowding work ahead. Everything in Cinnabar district is flourishing. About the Center the mines have cleaned-up, and report says they did well. We met with Messrs. T. H. Blythe and H. G. Bixby, comprising the firm of Blythe & Bixby, of San Francisco, who are the projectors of the Coffee creek canal, and who informed us that although little would be done this season, they would make a new start early next spring, and be ready for active mining operations by the opening of another season. Both gentlemen seem well pleased with the appearance and prospects of the gravel deposits of that section of the county.

Nevada.

WASHOE DISTRICT.

Californania.—Gold Hill *News*, Aug. 26: The main north drift, at the 1550-ft level, is making good headway, and the ore in the face still continues of an excellent grade. Cross-cuts Nos. 3 and 4 are also in fine ore. At the 1500-ft level the lateral drift north from cross-cut No. 5 is in 42 ft, with its face yet in fine ore, and the same may be said of the lateral drift from cross-cut No 6, which is to-day in 29 ft. The ore deposit at this level is now becoming pretty well understood, through the systematic and thorough development of it by means of the various drifts and cross-cuts, dividing it up into regular blocks and squares throughout the entire length. At the 1400-ft level the lateral drift in the ore body is now in a distance of 209 ft from cross-cut No. 3, and has run into ore of a lower grade which does not seem to improve as the drift advances. The joint C. & C. shaft is 637 ft deep to-day, and well timbered throughout. Excellent progress is being made placing the massive and powerful new hoisting and pumping engines and machinery, and in the erection of the main buildings.

Cons. Virginia.—Six hundred tons continues to be the yield of this famous mine, and the bullion returns thus far this month have considerably exceeded those of last month at this time. The prospecting drifts south at the 1400 and 1500-ft levels, toward the Best & Belcher, are progressing well and give very encouraging prospects. The west cross-cut at the 1500-ft level, near the north line, has not yet reached the west wall. It is in 115 ft, and the face continues in excellent ore. The various working stopes and breasts of the mine are looking and yielding splendidly, as usual. The mill, and in fact everything in and about this mine, is running splendidly. Of the great C. & C. shaft, and progress at that point, which is intimately connected with this mine as well as the California, we have made mention in the portion of our report specially referring to the California mine.

Belcher.—Owing to scarcity of water in Carson river, as stated in last week's report, and the consequent inability of the mills to crush the ore, the yield of this mine has fallen off greatly, and less men are employed in ore extraction. This, however, is no detriment to the mine, for surely the ore remaining in it indicates no practical exhaustion, but will come very acceptably by and by. Prospecting and development meanwhile goes ahead vigorously at various promising points. Drifting east, at the 1600 ft level, progresses well, and the air shaft is raised up from that level 152 ft. Connection was made last Monday night with the 1300-ft level and the main portion of the air shaft being sunk from the surface.

Ophir.—Daily yield about 160 tons, principally from the 1400 and 1500-ft levels. The ore breasts and stopes are looking well, and average assays from car samples run over $100 per ton. At the 1700-ft level cross-cutting both east and west goes ahead lively, with very encouraging results, and sinking the incline below the 1500-ft level will be next in order. The new buildings are just what are required, and in fact all the workshops and other surface arrangements fill the bill admirably. Everything works well and smoothly, and the development of the mine is carried forward judiciously and well, regardless of the price of stocks.

Houston.—This mine, which lies in the mountains about four miles west of Carson City, is now being brought into prominent notice through recent valuable developments. The ledge is about 10 ft wide, between well defined walls, runs in a northerly and southerly direction and dips east. It is rich in free gold and contains considerable copper and silver. The shaft is 80 ft deep, and the character of the ore improves as further depth is attained. Experts say that it will eventually prove to be a silver mine.

Democratic.—This is a new and very eligible mining location lying just north of the Prospect and east of the Centennial in the eastern ore range or belt of the Comstock. The company owning it is composed of energetic men, with capital to back them, and they are going in for the development of their mine in good earnest, having a three compartment working shaft already sunk to a depth of eight feet with the bottom in very promising quartz.

Sierra Nevada.—New shaft sinking at a good rate of progress, the ground at the bottom working favorably and water giving little or no trouble. The drifts both north and south at the 1700-ft level of the old shaft are also making very satisfactory advancement, with no particular change to notice in the material.

Challar-Potosi. — Daily yield, 90 tons, from the old upper workings. The various prospecting drifts at the 1150-ft level and the two levels below it, show no new feature of interest. Good work is being done sinking the new combination shaft, and the erection of the requisite buildings at that point also goes ahead satisfactorily.

Imperial-Empire.—The south drift, at the 1930 ft level, continues in excellent ore, and a fine, rich streak or seam of ore is found in the north drift. The east drift, at the 2000-ft level is cleaned out and is being run further east to see what may be found in that direction.

Julia.—Main drift south, at the 1000-ft level advancing well, in favorably working porphyry and clay, with fine looking quartz seams. No water in face of drift. The shaft is also making very good downward progress, and excellent work is being done opening out the 1400-ft station; The shaft is now down about 1450 feet.

Crown Point.—Daily yield not much over 300 tons at present, owing to the low stage of water in the Carson river not allowing the mills to crush the full amount of ore heretofore extracted daily. The Morgan mill, however, will come to the rescue next week, crushing 50 tons per day. This mill has recently been undergoing repairs. The main east drift at the 1700-ft level is in 175 ft, with no change of interest to record. The ore producing section are looking well as yet, with plenty of ore in sight.

Bullion.—The joint drift of this and the Alpha and Exchequer companies, recently started from the 2000-ft station of the Imperial is going ahead finely. It is a very important drift, and will develop those mines at a great depth. The main drift north from the 1700 ft level of the Imperial shows no new feature this week. It is still in very promising vein matter, however. The enlarging and sinking deeper of the old Bullion incline progresses well.

Yellow Jacket.—At the 1740-ft level the principal development work of this mine is being done. The main north drift is in 505 ft to-day, with the face in very hard porphyry. The north winze below this level is down 146 ft and the south winze 211 ft, both in dry, tough working material. The east cross-cut, between those two winzes is in 65 ft, with the face in quartz and porphyry No water.

Hale & Norcross.—The main west drift or cross-cut at the 2200-ft level is in to-day 111 ft but has not yet cut into the main ore vein, although there is every indication that it is not far off. The north drift from the winze is about completing its connection with the south drift from the Savage. The ore body at the tenth station continues looking well.

Caledonia.—Very good progress continues to be made sinking the new shaft; also sinking the main incline at the old works. The erection of the new hoisting and pumping machinery is also being urged forward as speedily as possible. The new pump will have plenty to do, as there is quite a flow of water already in the shaft to contend with.

West Belcher.—The tunnel is being driven ahead at a lively rate and will soon be under the incline, where good ore is known to exist and the extraction and milling of which will be at once commenced. The development of this mine is being done in a very systematic as well as energetic manner, and the prospects are very flattering.

Silver Hill.—Sinking the shaft progressing well, the rock working favorably. The station for the winze below the north drift of the third level is nearly completed. Cross-cutting at this level goes ahead well with improving indications.

Overman.—Drifting south at both the 900 and 1100-ft levels goes ahead vigorously, and those parts of the mine are being explored at a lively rate. The water in the shaft is kept reduced out of the way with perfect ease, the pump and machinery working well.

Globe Consolidated.—Main north drift from the old tunnel level advancing in porphyry, clay and quartz. Some little water is coming in at the face, which increases somewhat as the drift advances. South drift from head of incline in very promising ledge material. Face of north drift at the 260-ft level in quartz. Preparations for the reception of the new machinery steadily going forward.

Alta.—At the recent meeting of this company, held at their office in San Francisco, the following named gentlemen were elected as officers to serve for the ensuing year: Seth Cook, President; W. F. Myers, Vice President; W. H. Watson, Secretary; Bank of California, Treasurer. Trustees—Seth Cook, W. F. Myers, Daniel Cook, John Skae and R. N. Graves.

Leo.—Making good progress in driving northward drift from foot of winze. Ground continues to work very well, and no increase of water has yet been met with. Still have about 3 ft of fine looking quartz in face, some of which yields good assays. Are driving for a point underneath where the rich body of ore was found on the main tunnel level last year.

Iowa.—The drift for the ledge from the 400-ft station of the shaft is now 32 ft. The rocks in the face is hard, but blasts and works well. This tunnel will cut the ledge at a good depth in running 150 ft.

Savage.—Sinking the main incline below the 2200-ft level, and also the south winze below that level, going ahead as usual. The south drift is about completing connection with the drift north from the Hale & Norcross.

Prospect.—Shaft sinking as usual. Bottom in hard rock which blasts well. Face of tunnel in hard porphyry, with streaks of clay and quartz seams, which give excellent assays. Water increases a little.

Mexican.—Bottom of winze below 1465-ft level in very fine looking ledge matter, with occasional spots of good ore. This material is soft and easily worked, allowing of very good progress in sinking.

Amazon & Glasgow.—Very good progress continues to be made sinking the shaft. Bottom of winze in low grade ore, which shows constant improvement as further depth is attained.

Baltimore & American Flat.—Nothing new to report this week. The various prospecting drifts at the 750, 450 and 850-ft levels are going ahead vigorously, and good progress is made sinking the main incline.

Europa.—Sinking the new shaft progresses finely, the bottom being in very favorable material.

Gould & Curry.—The enlarging and retimbering of the drift connecting with the Best

r Belcher at the 1700-ft level, as well as the epairs to the main shaft, are progressing toward completion, and good developments will ollow, as a matter of course, in due time.

Cosmopolitan.—The extraction of ore from he stopes is discontinued. The main tunnel is being driven ahead to the northward following he vein, with its whole face in milling ore at present. The winze, below the tunnel level, is also in fair grade ore.

Dayton.—The new machinery works finely, and the water in the shaft is reduced to the second station, where the heavy pump is. This is now being brought to bear in the case, and will make short work with the balance of water in the shaft.

Centennial. The machinery for this mine has been overhauled and is now ready to be put in place. Sinking the main shaft will be prosecuted with vigor. It is thought that the shaft can be sunk 80 ft per month.

Union Con.—The winze below the 1300-ft level is making very good progress downward, sinking in very promising vein matter, interspersed with occasional spots and streaks of ore, but no concentrated body of it is met with as yet.

Rock Island.—Driving the main north and south drifts at the 450-ft level, and sinking the main shaft deeper below that level makes very good progress. No new features of interest to report at either point.

Phil. Sheaman.—The new hoisting machinery is already arriving, and will be put in position at the shaft as soon as the requisite grading is completed. It is proposed to sink the shaft 600 ft deeper.

Sutro.—Very good work is being done in the main west drift, although, owing to the extreme hardness of the rock in the face, progress is rather slow at present. Very little water coming in.

Senator.—The water tapped in the face of the drift decreases. It does not interfere at all with working progress. The work of development goes on as usual. Nothing new to report.

Best & Belcher.—Owing the great heat and lack of ventilation, the work of cleaning out, enlarging and timbering the main south drift necessarily progresses but slowly.

Utah.—Sinking the shaft deeper is progressing energetically, the machinery works as well as could be desired, and cross-cutting is resumed at the 400 ft level.

Florida —West drift advancing finely in splendid looking vein matter, streaks of which give good assays. Very little water and that constantly decreasing.

Daney.—Placing the new machinery and making necessary repairs goes ahead energetically, and the works will be ready to start up again the last of next week

North Con. Virginia.—The new hoisting machinery works well, and water does not interfere, consequently the sinking of the main shaft progresses at a very lively rate.

Niagara & Monumental.—One compartment of the incline is diacontinued and the other two are being sunk at a very lively rate, over 30 ft being sunk last week.

North Chapman —The three compartment first-class working shaft for the development of this mine, is commenced and is being sunk at a lively business-like rate.

Nevada.—Drifting in very favorably looking rock. Some good ore was struck in the crosscut yesterday, which may lead to a large and valuable body of ore.

Justice.—Nothing new to report. Drifting south at the 800-ft level as well as the ore developments of the old mine progresses as usual.

Knickerbocker,—The pumps are doing their best to reduce the strong flow of water, and are slowly getting the best of the situation.

Buckeye.—The pumps are nearly completed, ready for active service, and prospecting at the lower levels will be resumed very shortly.

Leviathan.—Drifting at the 400-ft level in the ore vein, driving ahead vigorously, with no feature of importance to note as yet.

Lady Bryan.—Drifting north and south at the 380-ft level, and sinking the main shaft at the usual good rate. Nothing new.

Wells-Fargo.—Bottom of shaft in good working ground, and water not interfering; work goes ahead to very good advantage.

Succor.—Both main drift and cross-cut at the 550-ft level are in very favorable, easy working vein material at present.

South Comstock.—Cross-cutting at the 275-ft level going ahead finely as usual with no change of interest to report.

North Carson.—Face of main west tunnel still in fine looking ledge matter, and driving onward toward the main ore vein.

Mint.—Shaft sinking is tough, hard blasting rock at present. No water. Total depth today, 792 ft.

Pictou.—Face of main tunnel in porphyry, with occasional streaks of clay and quartz. Driving ahead vigorously.

Woodville Consolidated.—Sinking the main incline is resumed, the chamber or station at its head being completed.

New York Consolidated.—Placing the heavy new machinery and the other surface work goes ahead well as usual.

Moore and Morgan.—Under the new contract, sinking the shaft is resumed and good work being done.

Occidental.—Faces of both cross-cuts east at the tunnel level in quartz with good streaks of ore.

Dardanelles.—Face of drift in improved ore, indications looking better than last week.

Original Gold Hill.—Face of north drift in milling ore. South ore body still showing finely.

Idaho.

Mining Notes.—Owyhee *Avalanche*, Aug. 28: Work at the mines is going on as usual. At the Pauper the new ledge in the vicinity of the 4th level is turning out splendidly. It is four feet in width, and as far as operated there is the best of reason for the statement that it will realize the most sanguine expectations of those interested. From the 3d level down the ore has been continuously improving in quality, while the rich sections of the ledge have been improving in dimensions. As the work progresses, the fissure has been constantly enlarging. There is a well defined body of ore throughout and the most favorable results may be expected from present operations in the mine.

At the Silver Cord matters generally wear a very promising appearance. The new machinery is nearly all on the ground and much activity is noticeable in the preparations connected with the erection of the hoisting works, all of which promise to be of the most substantial description. The new engine will arrive in a few days. The rich ore body in the 4th level continues to show up well, and affords daily the most promising indications for the future.

The reports from the Mahogany are quite favorable and fully confirmatory of the satisfactory developments alluded to a few days ago. In the south drift of the 9th level on what is known as the Dolphin ground, the ledge continues to disclose a splendid grade of ore, and competent judges express the belief that there is abundance of it. In the 4th and 7th levels the south drifts are making the same favorable progress as hitherto reported. There is the usual force of men at work in the mine, numbering in all about seventy or upwards.

The machinery at the Ida Elmore is undergoing repairs, and the pumps and boilers are being made ready for active service preparatory to the work anticipated in connection with the cutting of the ledge. Other matters about the mine remain the same as usual.

Preparations are in progress for more active work at the Belle Peck. The recent developments being regarded as highly encouraging, the mine will soon be worked on a large scale There is already a large quantity of good ore at the dump awaiting shipment to the mill.

At the Golden Chariot, Superintendent Lennon is pushing the new works with vigor, and the exterior of the mine will soon wear an entirely new visage.

There are 80 men at work in and about the Oro Fino. The ore, which is being shipped daily to the South Chariot mill, continues to be of good quality. The mill is being run day and night on this ore.

At the Illinois Central and Poorman mines, matters remain about the same as at the date of our last report. In the former the work of taking out ore is progressing favorably, and Superintendent Linkton reports the most favorable indications for a good fall business.

Parties interested in the Wagontown mines say that the rock taken out is steadily improving in quality, and the best foundation exists there for one of the most lively camps on the coast.

From several of the smaller mines in this immediate vicinity, we continue to receive favorable reports. The Potosi, the Black Jack and other mines near town are being worked with a limited force, and recent developments are such as to afford much encouragement to the owners.

South Mountain is recovering gradually from the recent quiet prevailing there, and the people generally feel quite encouraged in the prospect of having new furnaces and other works carried out.

Lower California.

New Discoveries.—San Diego *Herald*, August 21: Mr. Schofield, arrived yesterday from Ensenada bay, brought with him 1,500 lbs. of chloride silver ores which assays from $300 upwards. He has three ledges, averaging from six feet to nine in width, situated within two and a half miles from the main harbor of Ensenada bay. He will be in readiness to supply 500 tons per month to any ship, schooner or vessel that may call there and contract at reasonable prices.

Montana.

Moose Creek Mines.—*Mountaineer*, August 19: Discoveries have been made in the channel of Moose creek proper, Perry, Fairweather, and other gulches tributary. Considerable excitement and quite a stampede. 150 to 200 men are prospecting on Moose and other gulches. A mining camp in embryo christened Treanorville, is on the bar above the junction of Mosse and Perry gulches, with one store and saloon by Burgess & Co.; one saloon by Connor & Way, and a saw mill three-quarters of a mile below camp. Moose creek proper is located and staked from the canyon below to its head, and nearly all the tributary and neighboring gulches. Something out of the common line so-called Secret channel, upon which Messrs. Thompson, Dickey and others have thoroughly prospected, and are at work. They have traced an old channel or bed from below the mouth of Perry gulch over or, rather, through a hill of granite 300 ft high, across Perry gulch, near the upper end of the claim of Perry & Co., thence through another high hill or ridge into Fairweather above, a distance of a mile. This channel, worn in the solid rock, is filled with a hard wash gravel, from which fair prospects are obtained. At the highest point on the ridge, a shaft has been sunk to a depth of 70 ft. At the mouth of the channel ground-sluicing is carried on profitably. There has been but little real work done outside of that mentioned, and, of course the camp must be judged by insufficient developments, but that there are some good claims is certain.

The mica lodes in the vicinity of Ramsborn gulch are improving by development. Since the Mammoth mica was discovered, prospectors have located the George A. Poole and the Peruvian. This is a valuable mineral, and those ledges will be better than those of gold if the sheets are large and free from fractures.

The Metric System.

There has been for some time vigorous efforts to have adopted in this and other countries the metric or decimal system of weights and measures One of the principal difficulties encountered by commerce in the diversity of standards of value, weight and measure. The difference of terms, too, has only complicated matters. Not only has each nation had its own system, but in most cases arbitrary standards, having no conceivable relation to one another, have been set up. Something more simple, convenient and expeditious was sure to be invented. Out of the necessity comes the decimal system of weights and measures. It is founded on the ten or decimal relation, and is simple, so easily acquired that it is sure to chase out the old and cumbrous systems which have so long caricatured the common sense of mankind. Says a well known writer:

"It is a system, according to which the weight and dimensions of every material thing, whether solid, liquid or gaseous, whether on land or on water, whether in the earth or in the heavens, and whether determined by the scale, plummet, balance, barometer or thermometer, are ascertained by a method absolutely uniform, entirely simple, and equally suitable to the use of all mankind, resting upon a single invariable standard of linear measure, with multiples, and sub-multiples, like those of our monetary system, exclusively decimal, with appropriate names, similar in all languages; and itself secure against the possibility of change or loss through carelessness, or accident, or design, by being constructed on scientific principles and copied for distribution among the different nations of the world."

The following simple tables give all that there is in the metric or decimal system of weights and measures:

MONEY.

10 mills make a cent.
10 cents make a dime.
10 dimes make a dollar.
10 dollars make an eagle.

LENGTH.

10 milli-meters make a centimeter.
10 centi-meters make a decimeter.
10 deci-meters make a meter.
10 meters make a dekameter.
10 deka-meters make a hectometer.
10 hecto-meters make a kilometer.
10 kilo-meters make a myriameter.

WEIGHTS.

10 milli-grams make a centigram.
10 centi-grams make a decigram.
10 deci-grams make a gram.
10 grams make a dekagram.
10 deka-grams make a hectogram.
10 hecto-grams make a kilogram.
10 kilo-grams make a myriagram.

CAPACITY.

10 milli-liters make a centiliter.
10 centi-liters make a deciliter.
10 deci-liters make a liter.
10 liters make a dekaliter.
10 deka-liters make a hectoliter.

Up to date the new system has been sanctioned by law among more than half the people of the globe. The French, Germans, Italians, Spaniards, Portuguese, Dutch, Belgians, Mexicans, Swiss, Austrians, Danes, Grecians, English, Brazilians, and a majority of the nations of South America, have already adopted it. Great Britain legalized it in 1864; Germany in 1868, and in 1872 made it compulsory. In 1866 the government of the United States sanctioned it. No class here, however uneducated, will have any difficulty in becoming familiar with it, as we already use the first table, as given above, in all monetary transactions. The adoption of the others will be only the extension of the method which everybody accordingly understands. The metric system has been exclusively in use in the United States coast survey for years. Leading mathematicians, chemists, architects, etc., are rapidly adopting it in their respective vocations. In order to make its use general, a compact has been prepared and is being circulated throughout all the principal cities for the signatures of members of the scientific professions, whereby they pledge themselves to simultaneously take up the decimal system in July, 1876. The plan is meeting with general favor, and the new system will undoubtedly assume a national character from that time. The change may be regarded as a long step in the tendency of the age to adopt common standards to facilitate the multiform intercourse of the nations of the earth.

Two lines of express have been opened by the California, Arizona and New Mexico express company from San Diego to Arizona. One line goes by way of Yuma through the Penal mountains by way of Tucson to Silver City. The northern route is by way of Prescott, Hardyville and Phœnix.

The Ministerial Council at Madrid has decided to send 12,000 troops to Cuba by September 29th, and 10,000 more in October. The transports have already been chartered.

General News Items.

Advices from Egypt reports great confusion and excitement from military preparations. Troops are being dispatched to the Abyssinian frontier; at the same time the Khediva expects a call from the Porte for aid in the Herzegovinan rebellion, and all officers have been recalled from furlough. This will be a chance for our Americans in the Khedive service to distinguish themselves.

The Remington diamond badge was won on Saturday at Creedmoor by L. L. Hepburn, defeating Fulton, Yates and Campbell of the International team. Hepburn and Fulton each made 98 points, but as the former made the greatest number at the long range, 26, he was awarded the prize.

There will be another trial of the safe burglary case of Harrington and others, at Washington, important evidence having been discovered during the last three weeks.

The Commissioners appointed to investigate Prof. Marsh's charge of fraud against the Indian Agents have not yet made their report.

Hon. J. M. Thacher, Commissioner of Patents, has resigned. Ex-representative B. H. Duell, of New York, will probably succeed him.

Church, late head of the ribbon department of Jaffray & Co., New York, who absconded with $40,000, has been arrested in Montreal.

An attachment has been issued against the property of the Bank of California in New York city.

Union Adams, a well known dealer in mens' furnishing goods in New York, has failed.

The well known publishing house of Lee & Shepard, of Boston, has suspended.

A number of business failures in Montreal are reported.

The strike of mill operatives in Dundee continues.

The English polar expedition has sailed from Greenland.

Gen. Butler has been retained as counsel for Theodore Tilton.

The *Jefferson Borden* mutineers have been indicted in the U. S. court, at Boston.

A gentleman from Illinois proposes to locate a woolen mill at Chico, Butte county.

The Emperor of Germany will visit Milan in October.

Another revolution has broken out in San Domingo.

Mr. and Mrs. Sartoris and the baby have gone to England.

Cardinal McCloskey is in Nantes.

Fish at the Centennial.

It is the desire of the Centennial Commission of the International Exhibition to afford all reasonable facilities for the exhibition of fish and the various appliances and processes used in fish culture.

All parties engaged in the propagation of fish as a business pursuit will, no doubt, find it of advantage to exhibit, as also, those who are engaged in the manufacture of appliances for the culture and capture of fish.

It is therefore suggested that the "Commissioners of Fisheries" of the various States, take such concert of action as may surely accomplish so desirable an object; individual effort, however praiseworthy, can hardly be relied upon as expressing the importance and prospective extent of this new national industry.

The exhibition will open May 10th, 1876, and will continue for six months. The details of arrangement for a display of fish and fish breeding apparatus will be under the administration of the Bureau of Agriculture.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's Office at San Francisco:

Ryland M. Co.—August 19. Location: Nevada. Directors—John Willand, John Schweitzer Franklin V. Lee, Albert Cramer and William Moody. Capital stock, $720,000.

Oriental Soap Co.—August 19. Location: San Francisco. Directors—Wm. F. Flick, D. Henderson, Wm. F. Buswell, J. M. Johnson, A. P. Williams, George A. Treadwell and Wallace Everson. Capital stock, $250,000.

Russian River Land & Lumber Co.—August 20.—Location: Sonoma county, Cal. Directors—Milton S. Latham, Austin D. Moore, Wm. H. L. Barnes, Joseph P. Moore and James H. Dane. Capital stock, $1,090,000.

Steep Hollow G. & S. M. Co.—August 20.—Location: Nevada county, Cal. Directors—John Calvert, M. L. Power, S. T. Walsh, John Hutchinson and Wm. Corcoran. Capital stock, $3,000,000.

Swan Brewery.—August 23.—Location: San Francisco. Trustees—Frederick A. Elliott, Charles Willmot, J. S. Bugbee, Frederick Clay, A. J. Bryant, Caleb S. Hobbs and Frank M. Pixley. Capital stock, $100,000.

California Land and Building Association.—August 23.—Location: San Francisco. Trustees—A. S. Bristol, W. H. Carter, J. B. Wilson, R. T. Houston and R. W. Davis. Capital stock, $100,000.

Quadville Cons. M. & M. Co.—August 23.—Location: Placer county, Cal. Trustees—Frank F. Taylor, A. Badlam, Samuel Brannan, B. B. Strawsbury and Thos. Hannah. Capital stock, $1,000,000.

Moore's Flat Blue Gravel M. Co.—August 23.—Location: Moore's Flat, Nevada county, Cal. Trustees—S. B. Hunt, John J. Noon, John M. Witley, W. B. Cluff, N. H. Westfall and W. Small. Capital stock, $1,000,000.

Keokuk G. & S. M. Co.—August 23.—Location: Arizona. Trustees—M. A. Baldwin, W. F. Flick, W. F. Buswell, Fred. A. Elliott and L. J. David. Capital stock, $6,000,000.

THE FAIR CATALOGUE.

List of Exhibits

OF

The Tenth Industrial Fair

OF THE MECHANICS' INSTITUTE.

* Entries marked tbus were entered too late to compete for Premiums.

First Entry Book--Numbering 1 to 300.

No. 1. A S Hallsdie: Wire and wire rope.
2. Mercns C Hawley & Co: 1 Scbutler California Wagon.
3. J Spaulding & Co: Pioneer Carpet Beating Machine.
4. J H Smitb, San Leandro: 1 Saw Sharpener, Gosben Mannfacturing Co.
6. Housebold Furnishing Co: Rattan Goods; Artistic Furniture, including Mantles, Sideboards, Chairs, Sbaker Cbairs, Turkish Rugs (from Smyrna), Meat Safes (wire), Lanndry Table, Nicaragua Hammocks, Englisb, American and French Fireplace Furnisbing Goods.
5. Housebold Furnishing Co: Coal Hods; Sets Irons; Fenders, Vases, etc.; Toilet Sets; Tin, Brass, Copper and Japanned Utensils for cooking; 1 Horizontal Ice Cream Freezer; Library steps.
7. O Darwin Owen: 1 Groceries or Delivery Wagon; 1 Light Platform Democrat Wagon; 1 Medium Platform Independent Wagon; 1 Farmers' Peoples' Wagon: From Cortland Wagon Manufacturing Co, N Y.
8. C Juegen: 12 boxes Glue.
9. Neylan & Young: 7 Asst'd Cameron Pumps; 1 Way Valve; 1 Stoddart Pat. Condenser, with Pump Pipe complete; 1 Condenser (without pipe).
10. Eureka Gas Machine Co: 1 Eureka Gas Machine, 50 lights—in full blast.
11. James G Steele & Co: Squirrel Poison.
12. Wm J Fisher and W G W Harford: Conchological Collection.
13. S Gray: Model of Combination Safety Elevator (Twin Staire and Ligbt Shaft). Patent applied for.
14. J C Senderling: 2 sizes Baker Blower.
16. J Hendy: 2 Concentrators; 1 Planer; 1 Large Lathe.
16. Dewey & Co: 1 Large Drnm Cylinder Steam Printing Press—from Painter & Co's Type Foundry.
17. Dewey & Co: Tbe MECHANICS' FAIR DAILY Newspsper and Job Printing office.
18. Cal Pottery and Terra Cotta Works: Pottery—Chimney-tops, Vases, Pedestals, Swans, Dolphins, Statues Awning, etc.
19. Justin Gates & Co: 5 Soda Fountains variously located.
20. Herman & Co: Specimens of Ores, Minerals, Fossils, Relics, Shells, etc.
21. M P Boss: Tbe Boss Quicksilver Pnmp.
22. Adam Tollratb, Oakland: 22 Varieties Horseshoes.
23. San Francisco *News Letter* Reporter's office: John Gilman, Tbos Gidley.
24. W S Hochstadter: Sketch of Fence Post.
25. Healds Business College: Telegraph Apparatus and Office.
25. W H Jameson, Jr: 1 Davis "Steel Wbeel and Axle."
27. Brainard C Brown: 4 Wooteu's Patent Cabinet Office Secretaries.
28. M Hansen: 2 Scroll Saws.
29. G A Potter: Samples Excelsior Cooking Utensils.
30. Ackerman Bros: French, China Decorated Dinner Sets, Silver Plated Ware, Fancy Goods, etc.
31. L Heinoe: Samples of Glassware.
32. I T Milliken: Marbleized Mantels and Grates.
33. N S Coon: Tbe "Main Leaf Catarrb Remedy;" tbe Improved Perforated Frictional Belt; Hoyt's German Cologne and samples of Rubber Good..
34. Parke & Lacy: 1 Buffalo Tunnel Carriage; 1 Mining Drill; 1 Tunnel Drill complete; 1 No 5 Air Compress Tank; 1 Injector Pump; 1 12-Horse Haskins Engine; 1 10-Horse Haskins Engine witb Boiler.
35. Parke & Lacy: 1 2-Horse Haskine Eugine with Boiler; 1 6-Horse Haskina Engine single; 1 4-Horse Haskins Engine single; 1 2-Horse Haskins "Yatcb Engine;" 1 Heald & Oisco No 6 Centrifugal Pump; 2 Bucket Plungers, Nos. 2 and 3.
36. E Pander: Pedestals; Fountain and Landscape.
37. N W Spaulding: Patent Inverted Teeth Circular Saws.
38. Pacific Saw Mannfacturing Co: Circular, Mill, Mnley, Drag, Gang, Cross-cut, Band and Scroll Saws—Butcher, Ice and Metal Saws—Bevel, Backband, Table and Compass Saws—Saw Mandrels, Planing and Carriers' Knives—Cabinet Scrapers, Plasterers Mitreing Tools.
39. Geo H Atkineon: Hays' Patent Turning Latbe—Specimens of turned work.
40. C O Burr & Co: Samples Mustards, Spices and Oils.
41. H H Coe: 3 Lifting Machines.
42. R W Brehm: West Oakland, 1 Wood Turning Lathe.
43. W H Bovee: Vernon Mineral Water.
44. Sam'l S White, Philadelphia, Pa, or J H A Folkers & Bro, San Francisco: Dental Goods, Artificial Teetb, Operating Chairs and Stools—Office and Laboratory Latbes—Burring Engines and appliances—Celluloid apparatus—Extension Bracket—Corundnme Dental Instruments and Appliances.
46. Carolan, Hooker & Oory: Hardwaro: Samples: Plate Steel, Horse Shoes, Sledges, Lathe Chucks, Steel Shoes, etc.
45. Weaver, Taylor & Co: Ssmples Rubber Goods.
47. Sbowers, Jewell & Cole: 4 Remington Sewing Machines.
48. G W Briggs: 1 "Royal" Cooking Range.
49. E Guittard & Co: Samples Chocolate, Coffee, Spices, Yeast Powder, Cream Tartar, Baking Soda.

900. R C May: Combined mop.

TOTAL NO. OF ENTRIES.....627

Unseaworthy Ships.

Under this heading the London *Monetary and Mining Gazette* of August 7th, says:

Some important amendments were made on Thursday evening, in the Unseaworthy Ships bill, when it received substantially its final shape. It was read a third time last evening, will be sent np immediately to the House of Lords, and in a few days will receive the Royal assent. It will he recollected that in committee a clause was adopted making it compulsory, when more than one-third of the cargo of a British ship consists of any kind of grain, to carry that grain in bags, or by means of bulkheads, or otherwise, to prevent its shifting. Although several amendments were proposed to this clause on Thursday, no material change was made in it. Besides this clause, the government accepted in committee the principle of a load line, promising to bring up a clause on report embodying that principle in a form more satisfactory than that proposed by Mr. Norwood. It also accepted a clause making it penal to send or take a ship to sea in an unseaworthy state. We congratulate Mr. Plimsoll on this substantial triumph in a cause which he has sustained single handed for so long a time. We say single handed advisedly, for notwithstanding the favor with which his efforts have been regarded by the country, he alone has been the champion, and the press and the public have but stood round to applaud and encourage. The victory has been attained, and the dauntless champion must have all the honors. We cannot refrain from re-echoing the noble words of John Ruskin, and we are assured that that independent and patriotic Briton will not accuse us of plagiarism, when we request of the British nation "permission to convey their thanks to Mr. Plimsoll, for his christian, knightly and valiant stand made against the recreant English Commons, on Thursday, July 22d, 1875."

Cheap Coal.

Coal has always been a pretty expensive article in San Francisco, and it is only within the past few years that any attempt has been made to furnish it at a reasonable price. Now, however, it is possible to buy good coal at $8 per ton, by owning stock in the mine which produces the coal. There are, in this city, a few companies doing business on this basis, who furnish coal to stockholders at $8 per ton, with the charges for delivery added. The Coos Bay Union coal mining company is one of these.

The plan adopted to furnish cheap fuel is simple. The company offers for sale 2,000 shares of their capital stock, at the rate of $30 per share, in gold, payable in six monthly instalments of $5 each. The holder of each share of stock, for each and every share which they may severally hold, is entitled to receive on the wharf or company's yard, in San Francisco, one-half ton of screened coal per month, at $8 per ton of 2,000 pounds, payable in gold coin. Should they want the company to deliver at their respective houses, the cost for delivery is charged according to the distance to be hauled.

The usual cost to consumers of Coos Bay coal is $13 per ton. It will be seen that a family using six tons of coal per year will save more than the cost of a share of stock in one year; and in addition thereto, they will be entitled to their pro rata of the dividends declared by the company. The company does not furnish sacks to those doing their own hauling. At the expiration of five years the shareholders have the option of returning their several shares to the company, and receiving therefor $30 worth of coal, at the rate above mentioned. The stock issued to purchasers is unassessable, and subscribers are entitled to draw coal from the date of the first payment.

The property of the company consists of 640 acres of coal land, in Coos county, Oregon. The title is U. S. patent. On the land there is an abundance of good lumber, principally white cedar and yellow pine, sufficient for the requirements of the mine and a large surplus for sale. A railroad has been constructed from the wharf at Coos bay to the mine. There are on the property, in sight, four distinct veins of coal, from five to six feet in thickness respectively. The mines can now deliver over one hundred tons of coal per day.

No extensive hoisting works or pumping gear is required. Two-ton cars are run into a long tunnel, there loaded and the coal delivered on board the vessel with one handling. The company have several vessels bringing coal to San Francisco. Coos bay coal is so well known here that it would be superfluous to say much of its qualities.

The coal is bright and of excellent quality, containing more than the usual quantity of carbon. It burns free, leaving no clinker, and much less than the usual quantity of ashes and soot. It is admirably adapted for household purposes and for steam.

Saw Making in California.

The Pacific Saw Manufacturing Company of San Francisco, has now been in operation almost nine years, and opened out a very important mechanical enterprise.

The extraordinary size of the forest productions of California has naturally led to the employment of saws of very large size. As the saws increased in size, the care in their manufacture, necessary to secure a perfect run and rapid feed, has increased in a doubled ratio. To keep pace with this augmented demand, both as to quality and quantity in this line, this company has secured the most perfect machinery and best skilled workmen to be found in the trade. The raw material is obtained from abroad, and consists of the very best cast steel that can be procured. That used for circular saws is imported in circular pieces. The material for all other saws comes in the rough, uneven and as unlike the beautiful polished surfaces exhibited as can well be imagined.

The art of turning and tempering huge circular saws is a very difficult one. Great care is taken in performing this difficult work to its utmost perfection, and they have succeeded greatly in this specialty. The process of the manufacture of the movable teeth, although carried on at this establishment, is quite a separate business.

Spaulding's patent movable saw teeth have almost entirely revolutionized the business of large mill saws, and added greatly to the economy and capacity of the instrument. The casual observer cannot fail to see with what simplicity these teeth are made and how easily they can be replaced.

The company also manufacture reaper and mower sections, planing knives, curriers' knives, saw mandrels, etc. Saws of any description or size can be made to order if desired. This manufactnre of saws is a home industry, which, we believe, is receiving the support it merits from the community.

NORTH CHIPMAN.—This is another of the old mining locations of the Comstock belt, which, in the hands of live men, with plenty of capital and energy, is now being brought into deserved notice, through active operations towards its practical development. It lies on the east range of the Comstock, a short distance east of Gold Hill, and a few hundred yards south of the Europa.

MINING AND SCIENTIFIC PRESS.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Metallurgy of the Copper-Silver Ores of Inyo County, 145. The Financial Situation; Short Lectures on Patents; Electro-Plating, 152. American Supremacy; Tool for Undergraving and Clinching Horse-Shoe Nails; Rock Drills, 153. Patents and Inventions; The Mining Share Market, 155. General News Items, 148.

ILLUSTRATIONS.—Metallurgy of the Copper-Silver Ores of Inyo County, 145. General View of Cars and Dummy on Clay Street Railroad, 153.

USEFUL INFORMATION.—Musical Instruments Improved by Use; Progress of Flying Machinery; Mending China Ware; Why do Kerosene Lamps "Sweat" Oil; A Saving of Waste; The Philosophy of Settling Water with Alum; Impact; A New Source of Caoutchouc, 147.

GOOD HEALTH.—Sore Throats—Interesting Facts: Imperfections of the Human Eye; Mental Peculiarities; Man's Best Period; Catarrh; Bathing and Exertion Good for the Eyes; Lemon Juice in Diphtheria, 147.

DOMESTIC ECONOMY.—Information About Yeast; Welsh Rabbit; "Dutch" Cheese; Preparation of Washing Blue; Grape Sauce, 147.

MINING SUMMARY from the various counties in California and Nevada, 148-9.

MISCELLANEOUS.—The Transit of Venus—Results Obtained from the Astronomical Observations; Locomotives for Steep Inclines and Short Curves; Catalan Forges in New York; All They Want is Capital; Natural History Specimens, 146. The Fair Catalogue, 150-51. Unseaworthy Ships; Cheap Coal; Saw Making in California; North Chipman, 151.

ANOTHER GRAND SUCCESS.—The present fair of Mechanics' Institute has now been open about three weeks, and during this time the receipts have even exceeded those of the corresponding period of last year. The highest degree of satisfaction is manifested by all parties, visitors, exhibitors and officers of the Institute. The conservatory or horticultural department still holds its own in attractiveness. A visit to this exhibition enters in the programme of all who come to San Francisco, and in many cases it is the special object of the visits now being made from different parts of the State.

THE Silk Association of America have made up a comparative table of the imports of manufacturers of silk at this point, in August, from 1758 to 1875 inclusive, which shows a total gold value of the imports for the past month of 2,850,789. This averaged well with the last five years, and is a considerable increase over August, 1874. Of the 482 bales received 65 came from England and the Continent, 313 by the overland route and 48 by Panama. This represents nine-tenths of the whole imports, from which the Government derives about a million dollars duties.

THE Nevada *Transcript* says that quite a large force of men and horses have been put to work on the tunnel near the toll house, on the Grass Valley road. On all other parts of the route the work is being crowded. The prospect is very good for the entire completion of the work and the cars running into Nevada city by the 1st day of November.

A DISPATCH from London, under date of the 31st ult., says that the steamer *Faraday* had recovered the eastern end of the direct cable, and is in communication with London. Unfavorable weather retards the recovery of the western section.

THE Secretary of the Treasury has decided that hewn pine timber, commercially known as squared or sided, is subject to duty at the rate of one per cent. per cubic foot, and twenty per cent. ad valorem, as heretofore held by the department.

SUTRO TUNNEL.—Face of header in porphyry and clay, which has to be kept very carefully timbered and looked out for. Total length of tunnel 10,645 ft.

ENGINEERS are at work surveying for a narrow gauge railroad between Newark and Santa Clara.

THE Mechanics' Institute Fair has proved successful thus far.

The Financial Situation.

In the last issue of the MINING PRESS we briefly mentioned the failure of the Bank of California. Twenty-four hours later came news of the terrible fate which had overcome the deposed President, Wm. C. Ralston, who was drowned while bathing. In the fearfully impending panic people made a spasmodic grasp for their deposits in several other banks, and one, the National Gold Bank and Trust Co., supposed to be intimately connected with the Bank of California, was compelled to submit to a temporary suspension, and the Merchants' Exchange Bank did not open its doors on Friday morning. It is true an electric shock was felt in all business and trade circles, from the highest to the lowest; and it is also true that when the news of Mr. Ralston's tragic death flashed through the city, all money considerations seemed at once to be laid aside, and the noble sympathies and tender feelings of San Francisco were manifested in generous pity; and the honors that were paid to the dead banker, in the grandest and most impressive funeral that ever occurred in California, cannot be considered as offerings to wealth and power, for all know that he died penniless and powerless. San Francisco did herself great credit in this.

She has also done herself great honor in the way in which her people with stood this financial crisis. No matter though the business of the country is in a sound and healthy condition, very serious consequences would have ensued had the people yielded to excitement and alarm even to a degree that the circumstances of the case would seem to have warranted. A fearful after clap in the form of commercial failures might have been expected, resulting from losses of money in some quarters and loss of confidence in others; but suppositions of this character are now merely laughed at or receive no consideration. A strong feeling of hope and confidence is manifested, and we see no indications of a disposition to crowd or "apply the screws" to creditors. If we accept the slur cast upon our "way of doing things," implying that such a failure could not have occurred in any city but San Francisco, we certainly have the right to claim that no other city would have displayed the same courage and skill in averting a seemingly impending commercial crash.

As sad and serious as this financial drama has been, and though people have merely had time to comprehend and fit themselves to the present situation, ludicrous episodes are already claiming the attention of the community. The most conspicuous of these is the remarkable fact that nearly every man who now fails to meet his obligations, had a large amount of money deposited in the Bank of California. This trick, however, will soon get "too thin" to be of any avail. In conversing with a shrewd business man on the probable consequences of the great failure, he remarked that he did not believe one legitimate failure would result from it; but that it might be expected that some who *wanted to fail* would make a pretext out of it, either that they had lost heavily by the bank's failure, or that their creditors were crowding them in consequences of it.

Another ludicrous failure already discernable is the, "I told you so" brigade, composed of representatives from all classes, journalists being especially conspicuous, who now declare that they knew that this would happen, and had warned the public accordingly; but seeing that people were joined to their idols and were not educated up to the requisite standard they let them alone.

On Tuesday last at a meeting of the Directors of the Bank of California it was decided to resume business again, and for that purpose $5,000,000 were subscribed, $1,000,000 of stock being taken by each of the following gentlemen: D. O. Mills, Wm. Sharon, Michal Reese and J. R. Keene, and $1,000,000 is to be made up by small subscriptions. It is supposed that all arrangements will be perfected for beginning business again within ten days. This action on the part of the Trustees will meet with general approval. The Merchants' Exchange Bank resumed business to-day, and the National Gold Bank and Trust Company will do so by Monday next. The latter institution is especially deserving of praise for the noble stand made by it on the afternoon of Thursday last. Their hour of closing was an hour later than the other banks, and yet the officers put a double force of tellers at work when the run commenced, and at four o'clock when they closed their doors had paid out over $800,000.

The banks of San Francisco generally were never on a more substantial footing than they are to-day, and we believe their financial condition is sounder than the banks of any other city in the Union. The outlook which one week ago was so dark and threatening is now bright and hopeful.

J. S. PHILLIPS, M. E., of this city, has recently started for Colorado Territory, to examine some discoveries recently made there in the way of deep placer mines, coal and gold and silver ledges. Mr. Phillips goes out in the interest of certain European capitalists, who will open up some heavy works in that region, should he be able to make a satisfactory report.

THEY talk of establishing an academy at Healdsburg.

Short Lectures on Patents.

No. 13.—By J. L. BOONE, of Dewey & Co's. MINING AND SCIENTIFIC PRESS Patent Agency.

Licenses.

A license is given by the patentee when a person desires to purchase from him the privilege of making or selling the thing patented. The license may empower the licensee to manufacture only, or it may empower him to make and use without confining upon him the privilege of selling. It can also empower him to sell without the additional privilege of manufacturing, this latter privilege being generally conferred under the title of *agency*. Any right disposed of under a patent which does not alienate the entire title of the patentee in a portion of the territory covered by the patent is termed a license. A license may be limited, or it may be exclusive. A limited license can be a simple shop, or farm right, or it can be made to include a special area of country. A patentee can dispose of as many limited licenses in one neighborhood as he pleases, but where the license is exclusive it has all the effect of an assignment inside of the territory covered by the license, and the patentee cannot dispose of any other rights inside of that territory. The only difference is that the licensee cannot maintain a suit against an infringer, but he must call upon the patentee to protect him in the enjoyment of his exclusive license in case another should infringe his rights. If a licensee exceeds the bounds of his license, he can be prosecuted as an infringer. A license is not a recordable document, that is, it cannot be recorded in the Patent Office at Washington, but it should be recorded in the clerk's office of the county in which the licensee resides and carries on business. This latter is for the protection of the licensee in case he should lose his license, document, or in case it should be destroyed by accident. An agent is usually appointed by the patentee when the privilege granted is to sell the manufactured article, but the certificate of agency unless it expressly gives the agent the privilege of manufacturing would not empower him to do so, and in this case the certificate of agency would be converted into a license. A patentee may appoint an agent to sell rights under his patent, or he can empower him to do so by giving him a power of attorney. In the former case the agent would only have the power to make contracts and submit them to the patentee. The sale or transfer would in that case have to be consummated by the patentee himself, but in the latter case the attorney would by virtue of the power given him be privileged to consummate the sale and sign the patentee's name to an assignment or license transferring the right without consulting the patentee, and his signature would bind the patentee. In giving a power of attorney to another the patentee should be careful to state the minimum price which his attorney is to receive for rights, otherwise the attorney could dispose of the patent for a mere nominal sum, and thus defraud the patentee of his invention. Too great care cannot be taken in drawing up these documents, for often the want of a single word, or the failure to observe a single formality proves disastrous to the patentee. Every power of attorney should be acknowledged before a Notary Public or other authorized officer, and it must be recorded in the Patent Office before the attorney completes a sale, otherwise the Patent Office records will not show the authority under which the attorney acted, when the assignment given by him is presented for record. Patentees should beware of a class of persons who make it a business to solicit agencies for disposing of their patents; especially when the solicitors require the payment of a sum of money, usually five or ten dollars in advance, ostensibly to cover preliminary expenses. These solicitations are usually made with a grand flourish of trumpets and a profusion of nicely printed circulars which are well calculated to win the good opinion of the patentee. In most cases should the patentee accept the proffered aid and advance the small amount required he is very sure to receive no benefits therefrom, while he is sure to lose the amount advanced. There are a few such agents who actually do advertise inventions placed in their hands to the full amount of money thus advanced, but where one person or firm is acting as the agent of so large a number of persons as this class of agents generally do, it is impossible for it to bestow much time on any single invention. Their plan is to place the models furnished them by inventors upon shelves where they can be examined by persons who desire to invest in patents, and if an intending purchaser should discover amongst the models on exhibition, one representing an invention that he desires to purchase the agent will sell him the right, but further than this they do not go. It is far better for the patentee to place his patent in the hands of some well known energetic person, with whom he is acquainted, and who will give it his personal and undivided attention. It is usually the most profitable for a patentee to sell his invention by counties. Such sales do not eat up the profits in traveling expenses like selling out in shop or farm rights, while the aggregate receipts from all the counties in a State are usually more than any single individual will pay for the entire State right. No fixed rule, however, can be laid down, while one invention requires to be handled in one way another requires an opposite treatment and each patentee must be his own judge as to the best means to realize from his invention. If an inventor intends to sell his invention by licenses, it is always better for him to have a number of blank licenses printed for his especial benefit. It gives his sales an appearance of solidity, and looks business-like. However a written license will answer every purpose, if the inventor prefers to make them in that way.

Electro-Plating.

Plating articles of inferior quality with gold or silver, is one of the most useful and beautiful of arts. It is largely practised in San Francisco, and no one does it better than Edward G. Denniston, proprietor of the San Francisco Plating Works, Nos. 653 and 655 Mission street. Mr. Denniston has shown us specimens of his work, including table ware, watches, jewelry, cutlery, door plates, numbers, articles of *vertu*, etc., all plated with gold or silver, and executed in the highest style of the art.

In addition to the articles above mentioned, we notice a mammoth silver amalgamating plate for mining purposes. This plate measures about 6½ by 4½ feet in area, and is, we believe, the largest piece of electro-plating ever produced in the world. Mr. Denniston makes a specialty of this kind of work. Until quite recently plain copper plates have been merely covered or "amalgamated" with quicksilver for such use; but practice has proven that silver electro-plated copper plates are much superior, and their use results in a much larger saving of gold. Some report the saving at double that which can be obtained from the ordinary plates. This combination of copper and silver causes the quicksilver, and consequently the gold, to adhere to the plate much more tenaciously, and consequently saves much of the gold that is washed away by the rush of water and friction of sand on the ordinary silver plates.

Mr. Denniston has a mammoth vat fitted up especially for this work, containing about seven hundred gallons of solution, so as to be able to turn out plates of any desired size. The copper of which these plates are made, is covered very heavy with silver for this especial purpose; a much heavier coating being deposited on them than on ordinary table ware, etc., a matter required to meet the extraordinary wear to which they are subjected. Generally one ounce of silver is deposited upon every square foot of their surface, although less is applied, and of course at reduced cost, whenever it is required.

By this art a set of ordinary britannia tableware may be made to look as gorgeous as though it were solid silver; or any ordinary article of table ware or *vertu* may be converted into the outward appearance of solid gold, at a comparatively trifling cost. Silver watches and jewelry are also plated with gold. Samples are shown as they appear both before and after being gold plated. Articles are plated light and heavy, to suit customers. Over two thousand gallons of solution are kept constantly on hand at this establishment, which is the most extensive and complete of anything in this line on the Pacific coast.

Gilding by galvanic action was produced as a laboratory experiment, as early as 1805; but it was more than thirty years afterwards, or about 1835, that this interesting process was formally applied to the arts, substantially as now done. As it may interest some of our readers to learn how this interesting process is accomplished, we append a brief description as follows: For costing articles with silver, a bath is made consisting of one part of cyanide of silver, to two or three parts of cyanide of potassium, dissolved in about 150 parts of water. The article to be plated is made the negative pole; and the plate of silver from which the plating is derived is made the positive pole, both being connected by suitable wires with a galvanic battery of an intensity suited to the amount of work to be done. The silver when deposited upon the article to be plated has a dead, silvery appearance, and wherever luster is required, it is brought out by a suitable application of polishing appliances. Great care is taken to have the articles to be plated thoroughly cleaned by acids, and rinsed in clear water. Every particle of grease or corrosion must be carefully removed, or the plating will not adhere. Any thickness of metal may be given according as it may be desired, by keeping the article in the bath for a longer or shorter period. From three to six hours is the time usually employed. For silver, one-half an ounce to a square foot forms a very suitable plate.

In gold plating the double cyanide of gold is employed in the solution, instead of the cyanide of silver as above described, while the positive pole consists also of a plate of gold.

Paper and other fibrous materials may be electro-plated by first rendering them good conductors of electricity. This may be accomplished by immersing such articles for two or three hours in a solution of nitrate of silver, with ammonia added, until the precepitate first formed is entirely dissolved again. After this immersion, the articles are thoroughly dried, and then exposed to a current of hydrogen gas, by which means the silver is reduced to a metallic state, and the articles are rendered sufficiently good conductors to be electro-plated in the usual manner. Fibrous articles so prepared are as yet considered as mere curiosities, although the art is a beautiful one, and one which might be utilized to much advantage in the way of ornamentation.

American Supremacy.

So fsr as can be determined with regard to the comparative resnlts to be reslized from the scientific parties sent ont from the various nations to observe the transit of Venne, the American parties were extremely fortunate, and more successful than those of any other country. Her choice of stations was excellent; the localitiee affording remarkably favorable weather, whilo the choice of methods employed seems also to have been snperior. Our partiee relied on the Halleyan method and photography, which were very successful; while the Delislean method, adopted by Grest Britain, fell short of anticipations, and quite failed in Nsw Zealand.

In mechanical appliances, also, America is just now making rapid etridee, not only in rendering herself indepeudent of Europe, but also in competing with England—heretofore the great workehop of the world—for the sale of mechanical products in various foreign countries.

The British saw trsde in this country is completely extinguished. The general trade in steel is also trembling in the balance. Sheffield is no longer a particularly formidable rival for our manufacturere in this line. In the finer qualities of steel, for cutlery, drilling tools, etc., the Americans have for a long time held the ascendancy. American razore are now nowhere excelled, while throughout the oil regions of Penneylvania not a pound of foreign steel is nsed for the toole employed in boring wells; where the resulting cost of breaking a drill is so large aa oftentimes to involve the utter abandonment of an expenaive well. Hence price is there nothing as compared to quality, and operators employ that kind of steel which experience has proven the moet durable. Cheap steels are now just as much the staple product of America ae of England.

The file trade is another instance of Americsn supremacy, having become so by the adaptation of machinery in this conntry for the hand labor of Europe, which hae brought to pretty near an effectnal end the sales of Sheffield files in this conntry. In the pocket-knife trade the Sheffield makers are still doing a good business in this country; hnt that will soon he ewallowed up also. The keenness of Americon competition in Canada and South America is also exercising a diaaatroue effect on the Britiah manufacturere. In the latter country the American axe and mining shovel is coming into almost nniversal nse.

The American axe has for msny yeara held an acknowledged snpremacy the world over. Five thoneand of theae pioneer implements were recently sent to Norway hy a Pittaburg firm, being preferred there to any other make. A late correspondent of the London *Times* writing from the South African gold golds, saye: "No one here will look at an English axe; it was the same at the diamond fields, and also elsewhere."

In the mannfacture of both iron and steel rails America is now independent of Enrope. It ie to the recent and wonderful development of the iron trade of this country, more than to any other one thing, that the present depresion in the English iron trade is due. The London *Mining Journal*, in alluding to this fact, eays: "We are not altogether clear that the almost complete loss on our part of tho American outlet for our iron must not be regarded aa permaneut."

Barrancas is reported free from yellow fever.

Tool for Undergraving and Clinching Horse-Shoe Nails.

C. R. Donner and C. F. Subl of this city, have iuvented a pecnliar tool which they have recently patented through the sgency connected with this office. It is intended for undergraving and clinching horse-shoe nails. "Undergraving," is a fitting for the ends of naile which project through the hoof of a horse after faetening the shoe, so thst it will uot be necee ary to use a file as is ordinarily done, and the grooving or marring of the hoof is thus avoided. On the tool ie another device by which the nail may he folded down into the groove, and thus clinched without the nse of a hammer. The accompanying engraving showe the appearance of the hoof with the nail driven through, the groove for the nail, and the nail after it is clinched.

The implements with which theee objecte are accomplished, ie an addition to an ordinary pair of forceps. Upon one of the handles is fixed a eteel plate, one end being elotted transversely, so that the plate can be moved in or out. A sliding socket is fitted to be placed on the handle, and hetween the two lugs the graver and a flattened, corrugated or roughened plate (formed in one piece,) are hinged. The graver is a scoop shaped chisel, made sharp at its end, and when the forceps are closed, this graver projects from one side of the handle, and is retained in tbat position hy allowing the end of the plate to enter a elot between the plate and the handle, and this holds the graver

Improved Method of Clinching Horse-Shoe Nails.

steadily while the forceps are grasped by both hands, and the grooves cut in the hoof below the point where the nails come through. The grooves being all cut, the handles are opened, and the roughened plate turned outward, this carrying the graver into a slot in the socket, between the sides of which it lies. Notches are cnt in the handle and the edges of the graver, thns holding the socket, and preventing it sliding on the handlo dnring the operation of clinching the nails.

This operation is performed hy simply opening the handles, and placing the roughened plate beneath the hoof. The edge of the steel plate is then placed above the projecting point of the nails, and hy closing the handles the nail will he bent down into the groove already cnt, where it lies nearly flush with the hoof, and needs hut little, if any, finishing with the rasp.

The traneverse slot before mention has a screw passing through it. By loosening this screw the plate may he lifted nn a little and a short iron which projects below it may be allowed to drop into either of the holes made in the handle for its reception, after which the screws may be tightened. This arrangement allows the plate to be adjusted to fit it to large or small hoofs.

The inventor states that hy means of this device the necessity of filing the hoof is obviated. Some horses are very tender footed and the rasping and hammering hurts them. When the nail ie clinched it gives them great pain. A small hole about an eighth of an inch long and sn eighth of an inch wide is made by the graver and the other device clinches the nail into this hole and leaves no end out. The foot is not bruised by this method of clinching. No unnecessary portion of the hoof is filed away and no ring is made around the hoof by the rasp. If a shoe comes off on the road a farmer or teamster can, with this tool, remedy the evil without the aid of a blacksmith. Any one can learn to nse it and shoe his own horses. Chas. Donner or C. F. Subl, corner of Commercial and Drumm streets, San Francisco, will answer all enquiries concerning this implement.

Rock Drills.

Of all machinery at the Mechanice' Fair, the rock drille attract the largest shsre of attention. These implements, being used mostly in mining work, are operated where the general public have very little chance ever to see them. People generally have very vague ideas on the subject of mining machinery or mining work, and they feel interested when they are able to see machinery of this class in operation. Every afternoon and evening, while the drills are being run, crowds of people stand about and watch their operation, wondering to see the bar of iron go pounding into the solid block of granite like an auger into soft wood. The details of the operation of the different drills, of course, are of little interest to the many, although miners and those interested in mines naturally have their preferences for a particnlar kind. There are no diamond drills exhibited at the Fair, those shown striking rapid quick blows and running at a wonderful speed. To many it is a matter of snrpriso to see how rapidly they work, and they are somewhat puzzled to understand what runs them.

If we say steam, everybody has some idea of the process, hut the idea of compressed air as a motor is not so familiar. They see no steam jet, or blow off, or indications of steam at all, yet the drills work away rapidly, boring into the rock with marvelous speed, and with very little labor on the part of the attendant. The method of working is simple enough. Air compressors, aa they are called, are run by steam, and compress air into large boiler-like tanks until it reaches a pressure of from 50 to 70 pounds to the square inch. The air is then allowed to pass through pipes and strong hose from this receiver to the drills. These drills are provided with valves and appropriate mechanism so that the compressed air operates them as steam would an engine. They can also be run hy steam if necessary.

The reason why compressed air is used, however, in preference to steam, is that it may be conveyed a long distance in pipes at a much less loss of power than in the case of steam. Moreover, the cool air forced down to the drills in a hot mine, when used hy the drill, is exhausted in the mine, where it tends to cool and purify the atmosphere and furnish better air to the miners. The drille, too, are easier handled than when run hy steam, so that compressed air is now used almost entirely in preference to steam.

On this coast, where mining machinery is in so much demand, a great deal depen e on the cost, construction, durability and pattern of a drill. There are, accordingly, different opinions on the subject of the best drill, and as there are many competitors in the market, there is a correeponding difference of opinion. Among us on this coast, however, only a few of the many patterns inveuted are in use as yet, but this year several new candidatee for favor appear. Some of these have been tried in the Eastern States and have their records to prove their claims to popular favor. Others, again, are as yet untried practically for any length of time in real hard mining work. The excellency of a rock drill hy no means consists alone in its ability to get through a piece of rock of certain dimensions, at a greater speed than a rival. It must stand the test of continued work, ho simple in its parts, easily repaired and not liable to get out of order. It must be convenient to handle and not consume too much air. One drill may do more work in a given time than another, yet cost more to operate than one which does the same work more slowly. Economy of operation is a great point which has to he taken into account. The drill must, moreover, he of such construction as not to shake itself to pieces in a few months, although the strain upon a machine of this kind is very great, the repeated solid blows tending to jar the parts much more than ordinary tools are calculated to stand.

All the rock drills nsed are made to rotate slightly at each stroke, so as to give a new cnt-ting plsce for the sharp edge of the drill. Each time the blow is struck, the drill itself rotates, though so little as not to he noticed by the casual observer. The drill is "fed" into the rock hy the attendant, who turns a small crank at the upper end of the rock drill, which moves the drill forward into the hole it is working.

GENERAL VIEW OF CARS AND DUMMY ON CLAY STREET RAILROAD, S. F.

View of the Clay Street Railroad.

We give on this page a view, recently taken, of cars and dummy on the Clay street railroad in this city. In our issue of September 27th, 1873, we gave a full description of the working of this road. It has proved a success, and to-day is the most popular street railroad in San Francisco. It is excellently managed, and its extension is soon contemplated as well as the adoption of the principle in other streets of the city.

J. H. Culver, the efficient Secretary of the Mechanics' Fair, has received blank applications for space and other information in regard to the Centennial Exhibition at Philadelphia in 1876. Mr. Culver is authorized by J. Dunbar Creigh, Centennial Commissioner for California, to issue the applications to persons desiring to exhibit there.

The Petaluma *Argus* says that work on that end of the Sonoma and Marin railroad is progressing favorably. The line is nearly all graded between the Haystack and Novato and a large force is at work south of the last named locality.

The Assistant Treasurer at New York has been directed to sell $4,000,000 in gold in September, $1,000,000 on the first, third and fifth Thursdays, each, and one-half million on the second and fourth Thursdaye, each.

The Wilmington *Enterprise* says that the channel has already been materially improved hy the work of the Government dredge on the bar.

Averill Chemical Paint,

MANUFACTURED BY THE

Cal. Chemical Paint Co.

PURE WHITE, AND ANY SHADE OR COLOR.

This Paint is prepared in liquid form, READY FOR APPLICATION—requiring no thinner or dryer, and will not spoil by standing any length of time.

It is Cheaper, more durable, more Elastic, and produces a more Beautiful Finish than the best of any other Paint.

It will not Fade, Chalk, Crack, or Peel off, and will last twice as long as any other Paint.

In ordering White, state whether for Outside or Inside use, as we manufacture an Inside White (Flat) for inside use, which will not turn yellow, and produces a finish superior to any other White known.

Put up in ¼, ½, 1, 2 and 5 gallon packages, and in Barrels. Sold by the Gallon.

For further information send for Sample Card and Price List, or apply to the office.

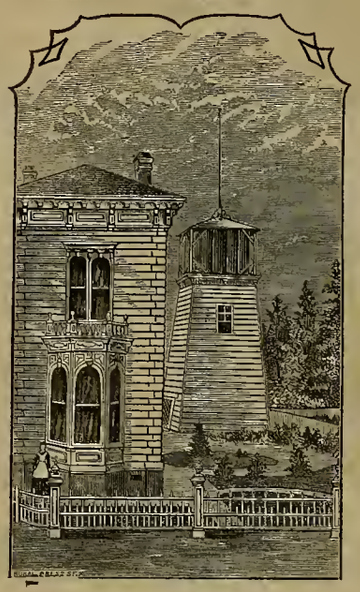
THE TURBINE.



Simplest, Cheapest, and Most Durable.

The Inventor of the Dexter Windmill has made new and useful improvements in Windmills, patented March 16th, 1875, and now feels confident of having the SIMPLEST, CHEAPEST, MOST DURABLE, and

ONLY PERMANENT WINDMILL

IN THE WORLD.

SIMPLEST, because it is less complicated; CHEAPEST, because it never needs repair, standing on a firm foundation; MOST DURABLE, because it is all under cover, and has less rigging to get out of order; ONLY PERMANENT, because the only Windmill in the world that has never been injured by storms. Hundreds of people, who have thought the Dexter perfect, will be glad to observe the SUPERIORITY OF THE TURBINE over all predecessors. Although much improved, the price of mills remain the same as formerly. Persons who study their own interest will investigate the TURBINE before purchasing any other.

Territory for sale outside of California, at reasonable rates and easy terms.

Mills built to order of the best material, and at the shortest notice, by Kimball Manufacturing Company, corner Fourth and Bryant streets, San Francisco. Any orders sent to their address will receive prompt attention.

AMMONIA

For Washing and Cleaning Purposes.

For Sale by all Grocers.

This article is universally used in Europe, and, recently introduced for general family use in San Francisco and neighborhood, is already in great demand. It is now the intention of the manufacturers to introduce it all over the Pacific Coast, at prices which will bring it within the reach of every household.

It is unequalled for cleansing Woolen Fabrics, Oilcloths, Carpets or Crockery; for Scrubbing Floors, Washing Paint, Removing Grease Spots, Shampooing or Bathing.

It renders water soft, and imparts a delightful sense of coolness after washing.

DIRECTIONS.—For Laundry, use two to four tablespoonfuls to a washtub of water. For bathing, use one tablespoonful in the bath tub. For removing grease spots, apply with a brush, undiluted, and wash with water afterward. For stimulating the growth of plants, use a few drops in every pint of water used in watering.

PRICE.—Per Pint Bottle, 25 cents; per quart Quart Bottle, 40 cents; per Half Gallon, 75 cents.

Also, SULPHATE OF AMMONIA for chemical purpose, fertilizing, and the preparation of artificial manure. AMMONIACAL PREPARATION, for the prevention and removal of boiler scale. CRUDE AMMONIA, for general manufacturing, and PURE LIQUOR and AQUA AMMONIA for chemical and pharmaceutical purposes.

☞Manufactured by the

SAN FRANCISCO GAS-LIGHT CO.

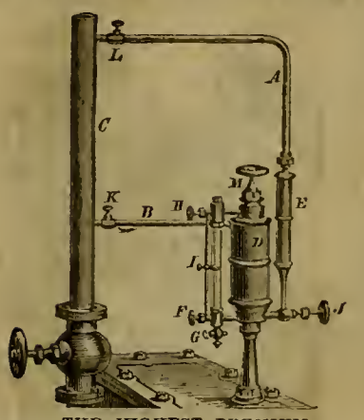
Machinery.

N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded hy the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged hy all engineers to be superior to any they have ever used; feed constantly hy pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gange; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted t give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S F. 24v23

The Mining Share Market.

As the Stock Board adjourned on Thureday leet and no s essione have been held since we heve little of interest to report in the mining share market.

The following companies heve levied assesments since our laet issne, viz.: The New York mining company, New York Consolidated mining company, Original Gold Hill, Poorman, Pruesian, Senator, Surprise Valley, and St John. No date has as yet heen fixed for the opening of the Board.

There was a rumor on the street this morning that there had heen a strike mede on the 1700-foot level of Crown Point end although it lacks confirmation the stock has advanced $3 per share in conesequence.

The Merchants' Exchange Bank which snspended payment on Friday last resnmed today and the National Gold Bank and Trnst company will probably resume hy Monday next.

Tbe reports from the mining districts continue of the most favorable character.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issne

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect secnrity and in the shortest nossible time.

CONSUMPTION,

The ecourge of the human family, may in its early stages he promptly arrested and permanently cured.

RAVENSWOOD, W. Va.

Dr. R. V. PIERCE, Buffalo, N. Y.:

Sir:—For the last year I have heen nsing your Goldeu Medical Discovery. I owe my life to it, having heen afflicted for years. Did not use it but a short time before I was benefi ed; at that time I was very bad, not ahle to sit up much, was suffering greatly with my throat, was getting hlind, had a dry cough, and much pain in my lungs. I have used twelve bottles of tbe Discovery and am almost well.

KATE T. WARDNER.

A son of Mr. J. H. Meseck, of Chatham Four Corners, N. Y., has heen cured of Consnmption by Dr. Pierce's Golden Medical Discovery,—so says Mr. C. B. Canfield, editor of the Chatham *Courier*.

S. R. EGLAR, druggiet, of West Union, O., writes to state that Dr. Pierce's Golden Medical Discovery has effected a wonderful cure of Conenmption in hie neighborhood.

UNITED STATES

Mineral Land Laws, Revised Statutes,

And Instructions and Forms Under the Same.

We have just issued a pamphlet contaiuog the general mineral land laws of the United States, with instructions of the Commissioner of the Land Office The contents of this pamphlet comprise all of the Government laws with relation to mineral lands of interest to the mining community, as follows: Mining Statute of May 10th, 1872, with Instructions by the Commissioner of the Land Office; Mining Statute of July 26th, 1866; Mining Statute of July 9th, 1870 Forms required under Mining Act of May 10th, 1872, as follows: Notice of Location; Request for Survey; Application for Patent; Proof of Posting Notice and Diagram of the Claim; Proof that Plat and Notice remained Posted on Claim during Time of Publication; Registers' Certificate of Posting Notice for Sixty Days; Agreement of Publisher; Proof of Publication; Affidavit of $500 Improvements; Statement and Charge of Fees; Proof of Ownership and Possession in Case of Loss or absence of Mining Records; Affidavit of Citizenship; Certificate that no Suit is Pending; Power of Attorney; Protest and Adverse Claim; Non-Mineral Affidavit; Proof that no Known Veins Exist in a Placer Claim, etc. There is also given the U. S. Coal Land Law and Regulations thereunder. The work comprises thirty pages, and will be sold, post-free, for 50 cents. It should be in the hands of every one having any mining interests. DEWEY & CO.,

Publishers of MINING AND SCIENTIFIC PRESS, S. F.

N. B.—We have also added to the above publication the REVISED STATUTES OF THE UNITED STATES, so far as relates to Mining Laws.

Thanks for Prompt Attention.

STOCKTON, June 26, 1875.

Messrs. Dewey & Co., S. F.:—

I have received the patent for my invention in wagon brakes, which you prosecuted for me; patented May 11, 1875—No. 163,046. Thanks to you for your prompt attention to this case; you will hereafter be my attorneys in such cases. I recommend all inventors on the Pacific coast to give you a call, which I think they will never have any cause to regret. Very truly yours,

GEO. G. BUCKLAND,
Stockton, Cal.

DEWEY & CO.,

PATENT AGENTS,

Office—224 Sansome Street, San Francisco.

Designing and Engraving at This Office.

We are prepared to do fine Wood Engraving for illustrating Landscape Scenery, Buildings, Machnery, Works of Art, Manufactured Articles, Trade Marks, Seals, Etc. We have a first-class

Machine for Engraving

A portion of the work, which can he finished therehy more perfectly than hy the eye and hand alone. Our patrons can depend upon first-class work always, and at reasonable prices. Samplee can be seen at our office.

DEWEY & CO.

The Large Circulation of the MINING AND SCIENTIFIC PRESS extends throughout the mining districts of California, Nevada, Utah, Colorado, Arizona, Idabo, Montana, British Columbia and to other parts of North and South America. Established in 1860, it hae long been the leading Mining Journal of the Continent. Its varied and reliable contents giving it a character popular with both its reading and advertising patrone.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. L. THARP—San Francisco.
B. W. OROWELL—California.
A. C. CHAMPION—Tulare, Fresno and Inyo Counties.
JOHN ROSTRON—California.
A. C. KNOX, California.
G. W. MCGREW—Santa Clara conty.
CHAS. T. BELL—California, Oregon and W. T.
D. J. JAMES—Australian Colonies.
JAMES KEARNY—California.
WILSON SPENCER—California.
CHAS. T. BELL—Montana, Utah, Idaho and Nevada.

To Country Printers.

The large drum cylinder printing prese, now nsed in the FAIR DAILY office, in the Mechanice' Pavilion, is offered for sale. It is nearly new, works satisfactorily, and will be sold at a hargain. Address PAINTER & Co., type fonnders, 513 Clay street, S. F., or the publishers of this paper.

Every Mechanic

Should have a copy of Brown's

507 MECHANICAL MOVEMENTS,

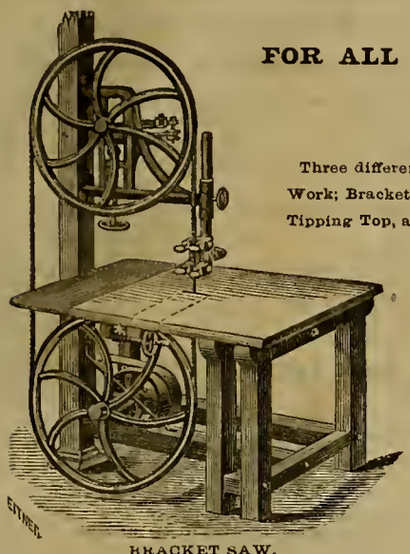
Illustrated and described.

Inventors, model makers and ameature mechanics and students, will find the work valuable far beyond its cost Published by DEWEY & Co., Patent Agents and publishers of the Mining and Scientific Press. Price, post paid, $1.

GIVE YOUR FULL ADDRESS when you communicate on business to this office, especially in returning newspapers. The fact that your name is on our subscription list is of no assistance to us. Without sending your post office address we should have to look over thousands ofnames to find yours.

PATENT ADJUSTABLE

Band Sawing Machines



FOR ALL KINDS OF WORK.

Three different styles are built: Large size, for Mill Work; Bracket, or Medium, with Stationary Top; and Tipping Top, as shown in cut of Bracket Saw.

For Pattern or Bracket Work the Tipping Top is very necessary. Being raised and lowered by eccentric, it is adjusted without delay, to any angle, and rests upon a solid bed when cutting square work.

The wheels are made large, and have wood rims, saws lasting much longer than on iron rims.

The machines are worked with the least lost time in adjusting, and are guaranteed to work as well as any machine made, costing twice the money.

Manufactured by

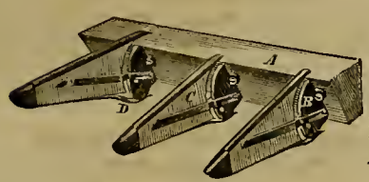
O. BONNEY,

221 Mission Street, S. F.

BRACKET SAW.

BONNEY'S PATENT ADJUSTABLE GRAIN LIFTER,

FOR HEADERS.



All farmers who wish to save their grain without waste in cutting, should examine these. They can be run at any inclination to the ground, as seen at *D*, in cut. Are light, strong and durable, and can be adjusted in fifteen minutes, or removed in five when not required, by drawing bolt in malleable shank, *B*. Set of 8 for 30-foot header (in putting on which bore with ⅝-inch bit for lag screws), are the cheapest, and give the best satisfaction for any in use. Parties can save additional the cost of a set in one day's cutting, where grain is lodged or trinkles down.

Also, HEADER APRONS, GRAIN BELTS and FARMING IMPLEMENTS, Generally.

PRICE, $40.

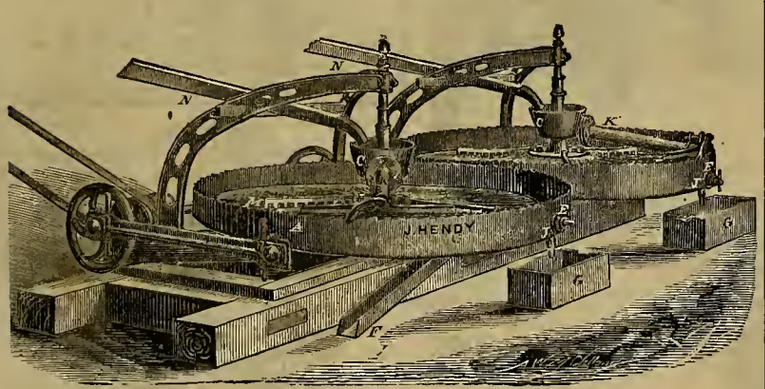
Manufactured by O. BONNEY,

No. 221 Mission Street, - - - - - - - - SAN FRANCISCO.

OVER $3,500 PER MONTH SAVED

BY THE USE OF

Hendy's Improved Amalgamator and Concentrator



Can be seen at the Manufactory, No. 32 Fremont Street, San Francisco.

SAN FRANCISCO, April 27, 1872.

JOSHUA HENDY, Esq.—*Dear Sir:*—As a practical miner and millman, I take pleasure in recommending the use of your Concentrators in all mills where gold or silver ores are reduced. No mills should be without them, for the following reasons:

1st. They are good sizers (no perfect concentration in pulverized ores can be effected without first sizing).

2d. The best Concentrator I have ever known—(the concentrated stuff only containing 5 per cent. of sand).

3d. They are good amalgamators, light (featbery) particles of amalgam and particles of coated gold by attrition are brightened, and from their specific gravity and the action of the pan, fall to the bottom and adhere.

4th. They require but little power and attention to run them, and with ordinary care will last for years.

I have been familiar with the workings of your Concentrators for four years past; have run them myself in the North Star Mine, Grass Valley; am familiar with their practical workings on the Empire Mine, Grass Valley; St. Patrick, Placer Co.; St. Lawrence, El Dorado Co.; Oaks and Reese, Mariposa Co., and most cheerfully give you this testimonial. For further information you are at liberty to refer to,

Yours respectfully,

JAS. H. CROSSMAN, M. E.

409 California street, or Cosmopolitan Hotel.

SAN FRANCISCO, February 10, 1874.

Office Superintendent of Keystone Con. M. Co., Amador, Amador County.

MR. J. HENDY—*Dear Sir:*—In answer to your inquiries as to your Concentrators furnished our company last July, I would say that I am more than pleased with them; and the saving to the company has been over $3,500 per month more than with the blankets and huddles formerly in use.

C. C. HEWITT, Supt.

OFFICE SUMNER MINE, Kernville, April 27, 1874.

J. HENDY, Esq.—*Dear Sir:* Having four of your Concentrators in use at our Mills for four or five months, which for saving Amalgam and for concentrating Sulphurets, are a success, beyond a doubt, I feel it a duty due you and those interested in Quartz Mills, to recommend them.

As further evidence of their worth, I now order TWELVE more of your Machines for our new Mill, now in course of erection.

E. R. BURKE, Superintendent.

For description send for Circular.

JOSHUA HENDY, San Francisco.

Office and Works, 32 Fremont street. 9v28-1m-tf

THE MINING AND SCIENTIFIC PRESS is the leading journal of America. New processes and mechanical inventions are illustrated and discussed in its weekly issues. It is a 16-page sheet, handsomely printed, for $4 per year. Dewey & Co., publishers, San Francisco. —[Mt. Lincoln News, Alma, Colorado.

THE thirtieth volume of the MINING AND SCIENTIFIC PRESS was completed with the issue of June 26th. Every miner in the country, as well as mechanics and those engaged in industrial pursuits, should subscribe for this really first-class journal.—[San Bernardino Advertiser.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published and issued, wholesale and Retail, by DEWEY CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY CUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quick silver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price $2.50 coin, or $3 currency, postage free

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO $5.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of the general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

Price, $5 in cloth; $6 in leather—coin.

Mining and Other Companies.

Gover Mining and Milling Company—Principal place of business, San Francisco, Cal. Location of works, Drytown, Amador county, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of August, 1875, an assessment of 20 cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company, No. 402 Front street, room 8, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 10th day of September, 1875, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Thursday, the 30th day of September, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

W. O. WILSON, Secretary.

Office, No. 402 Front street, room 8, San Francisco, Cal.

Hope Quicksilver Mining Company—Location of principal place of business, San Francisco, California. Location of works, Cinnabar Mining District, Sonoma County, State of California.

Notice is hereby given, that at a regular meeting of the Board of Directors, held on the 2d day of August, 1875, an assessment (No. 2) of Five cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, Room 2, No. 408 California street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 8th day of September, 1875, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Thursday, the 30th day of September, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

JACOB HARDY, Secretary.

Office, Room 2, No. [illegible] California street, San Francisco, California.

Manhattan Marble Company of California. Location of principal place of business, San Francisco, California. Location of works, Oakland, Alameda county, State of California.

Notice is hereby given, that at a meeting of the Directors, held on the 6th day of August, 1875, an assessment (No. 8) of five dollars per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary of the company, at his office, Nos. 13 and 15 Fremont street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of September, 1875, will be deemed delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 4th day of October, 1875, at 12 o'clock M., to pay the delinquent assessment, together with costs of advertising and expenses of sale.

L. L. ALEXANDER, Secretary.

Office, Nos. 13 and 15 Fremont street, San Francisco, California.

Mount Auburn Gold Quartz Mining Company. Location of principal place of business, San Francisco, Cal.

Notice is hereby given, that at a meeting of the directors, held on the 25th day of August, 1875, an assessment (No. 1) of twenty-five cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, No. 402 Montgomery street, room 9, second floor.

Any stock upon which this assessment shall remain unpaid on the 27th day of September, 1875, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Thursday, the 28th of October, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

U. A. JAMES, Secretary.

Office, 402 Montgomery street, room 9, San Francisco California.

Silver Wave Mining Company—Location of principal place of business, San Francisco, California. Location of works, White Pine Mining District, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 31st day of July, A. D., 1875, an assessment, No. 12, of twenty-five cents (25 cts) per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, No. 418 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of September, 1875, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Friday, the 8th day of October, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. W. CLARK Secretary.

Office, room 2, No. 418 California street, San Francisco, California.

Tolman and Miller Mill and Mining Company.—Location of works, West Point, Calaveras county, California.

NOTICE.—There is delinquent upon the following described stock, on account of assessment (No. 2) levied on the fourteenth day of July, 1875, the several amounts set opposite the names of the respective shareholders, as follows:

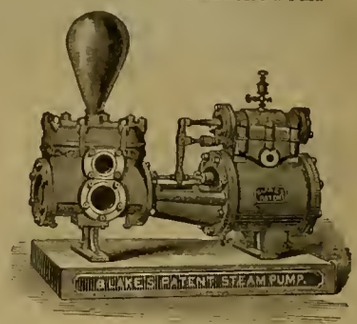
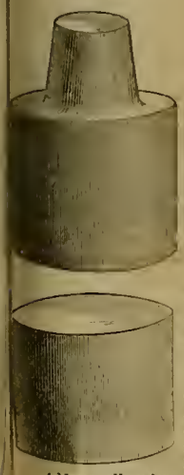
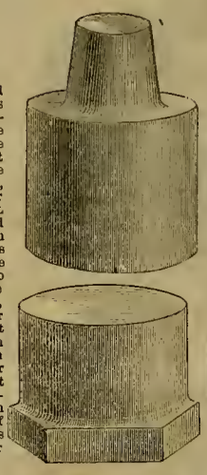
BLAKE'S PATENT STEAM PUMP



Over 7,500 in Successful Use in the United States.

Improved Cast and Forged Steel Shoes and Dies for Quartz Mills.





[PATENTED MAY 26TH, 1874.]

Price Reduced to 16 Cents Per Pound.

SAN FRANCISCO, November 10th, 1874.

To Supts. of Quartz Mills and Mining Men generally:

We take pleasure in stating that owing to the rapid increase in our orders, our Pittsburg Manufacturers have been compelled to add largely to their works—a new gas furnace and heavier trip hammer—and are thus enabled to reduce the cost of steel and at the same time produce SHOES AND DIES superior to any yet manufactured. We have consequently reduced the price to 16 cents per pound and solicit a trial order, guaranteeing that you will find them at least 10 per cent. cheaper than the best iron. There are no STEEL SHOES AND DIES made excepting under our patent and sold at this office, or by our authorized agents, though certain Eastern manufacturers advertise STEEL SHOES AND DIES which are only cast iron hardened by the addition of a composition. They will not out-wear two sets of common iron, though called steel. They are very brittle and are not capable of being tempered, flying from under the hammer like cast iron. Our STEEL SHOES AND DIES are in use in many of the largest mills on the Pacific Coast, and all who have tried them pronounce them cheaper and far superior to iron in every respect, even at the old price of 20 cents per pound. Their advantages over iron are cheapness on first cost, increased crushing capacity, time saved in changing and in setting tappets, increased value of smelting by absence of iron dust and chippings, and a saving of 75 per cent. in freight. It takes 50 days to fill orders from the manufactory East. Price 16 cents per pound shipped at San Francisco. Terms liberal.

Address all orders, with dimensions, to W. A. Townsend, Secretary.

VOLUME XXX Number 11.

Hydraulic Gold Mining.

[No. 3.—Written for the MINING AND SCIENTIFIC PRESS, By C. J. BROWN.]

Before proceeding to discuss the individual status of any single mining enterprise upon the section of mineral lands described in article No. 2, I will dwell more minutely upon its topography. I have asserted that the South Blue ran north to this place. The town of Dutch Flat is situated on, so to speak, the east bank of that ancient river, and on the south bank of its Dutch Flat tributary, which united with the South Blue on the southwest side of the town, and flowed thence southwest, Bear river having cut across it one half a mile below this junction. This point, standing far above and facing Bear river, is known as Thompson's hill; this hill was extensively worked as drift ground, by the Yankee, Potosi, Why Not, Badger and Ohio companies, from 1856 to 1863, and proved immensely rich in heavy gold of a very fine quality. This is at the lower or southwest extremity of what is known as the Dutch Flat mines proper, which extend from thence, about one and a fourth miles northeast to where the old channel has been cut off and destroyed by a tributary of Bear river, known as Little Bear river.

This Dutch Flat gravel bed was formerly located and claimed by many different mining companies under different individual names, and the claims they so located still retain their distinctive appellations, though now owned by but few companies. Except at Thompson's hill, where the ground was drifted, the former owners and locators have washed by hydraulic process and mined away the top or red gravel, leaving a surface of gravel and debris one-fourth of mile wide, and a depth, over the center of the channel, of about 200 feet.

Two small streams cross the South Blue, on this section of mining land, known as the Dutch Flat canon and Squeir's canon, each about two miles in length and of equal capacity. The first runs along the southerly side of and near to the Dutch Flat gravel channel, crossing the South Blue a few feet south of its junction with said channel. Three-quarters of a mile south, Squeir's canon runs in the same direction and nearly parallel with the Dutch Flat canon. They both flow along the trap-rock and empty into Bear river. Neither of them have ever eroded to the bottom or bed of the South Blue. They originally crossed it on gravel eight hundred feet wide and forty feet deep, with sloping banks three hundred feet, and more in highth. These canons are now the repositories of large masses of tailings washed from the gravel banks on either side.

From the foregoing description, one may sketch a line of gravel a mile and one quarter in length, running from northeast to southwest, and one-quarter of a mile wide, and commencing half a mile back from the southwest terminus (Thompson's hill) strike a similar line of gravel south one mile; the first will represent a section of the Dutch Flat channel, and the latter a section of the South Blue, *i. e*, the exterior limits of their gravel banks, the beds or deepest channels of these old rivers cannot be correctly represented by such arbitrary lines; they wind and meander within these exterior boundaries, underneath the gravel deposits, as sinuously as the channels of our present rivers. Their exact local courses are definitely determined, only by shafts and tunnels, yet the studiously observant miner can plan his labor with almost unerring certainty by his familiarity with the strata of rock along which the old streams flowed; and, analogically reasoning from cause to effect he must conclude that it was as natural for the old streams of the earlier pliocene epoch to be unfractuous as for the present ones, and all know that our live streams are as crooked as a snake in motion.

As a general rule, if a stream, flowing in a rock canon diverges to the right, it is sure to be followed shortly by an equal divergence to the left, and *vice versa*. Upon this basis I assert that the deepest channel under the Dutch Flat gravel bed is along the southern side of it. The inlet of the channel is under the Buckeye claim, and runs in a manner to cross under the southern portion of the Franklin claim, and continues thus to the outlet. For numerous good reasons this, also, seems to have been the course of the stream over and upon the trap slide which came into the old channels here, as previously explained. Consequently, from being comparatively undisturbed, this slide still lies thick and massive upon the western rim. In the South Blue the current ran upon the west side of the trap slide and left a heavy and troublesome line of it on the eastern rim.

I write thus in detail concerning this trap slide, because upon a correct comprehension of its nature, true position, and mode of washing it away most cheaply, depends the success of our mining enterprises. It is a dead elephant in the menagerie, which requires study, indomitable perseverance, time, patience and much capital to remove, but it will pay largely to remove it for what lies beneath. It is about ninety feet deep on the western side of the outlet of the channel, and extends in a wedge shape across to the opposite rim, where it is comparatively shallow. Here is located the Yankee claims, the main hydraulic works of Cedar Creek gold mining and water company, an English corporation, which purchased from the Dutch Flat water company, in the spring of 1872, extensive ditch property and large tracts of mining ground, paying therefor about $400,000.

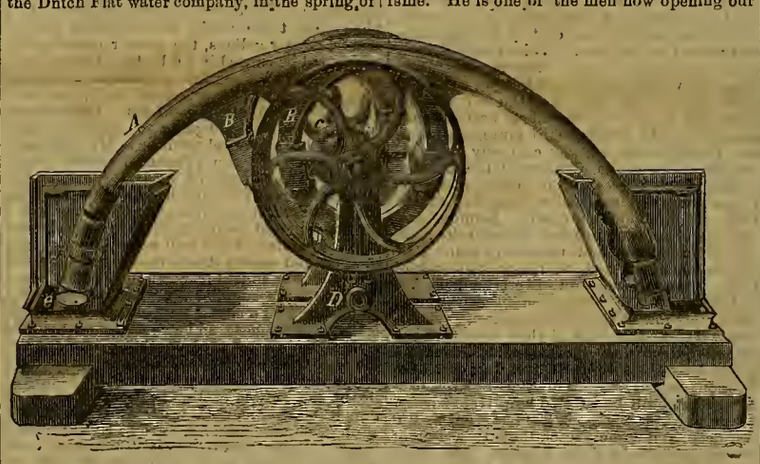
Of the mining claims in their original purchase, only the Yankee, the Deep Shaft and Iowa covered any portion of the deep channel on the north side of the Dutch Flat canon. On the channel of the South Blue, between the Dutch Flat and Squeir's canons, the Cedar Creek company owns the Carr, Waukegan, Flying Fish, and the Jehosbaphat claims, they are all, except the first upon the east side of the deepest bed of the channel. The Carr claim is situated right over it, and has never been worked; it is, no doubt, a rich piece of ground, and is besides, valuable for its position, but the company cannot avail itself of either its wealth or advantages except in prospective for two or three years.

At the time the Cedar Creek company took control of the property purchased, it was very fortunate indeed, in the selection of Col. T. B Ludlum as general superintendent. He had little or no practical knowledge of conducting a single hydraulic mine, much less the supervision of five or six at the same time in different localities, together with the care of sixty or seventy miles of ditch.

It is my opinion that could he have foreseen clearly, the obstacles in the way of his success, he would have repeated the language of Gen. Burnside upon accepting command of the army of the Potomac, and prayed fervently for larger expanse of brain and bravery enough to subdue his fear. He was wise enough to retain the old crew of men upon all his lines of ditches, and entered upon his duties with an evident intention to do his best. He early comprehended the true character of the different strata of rock on his line of works, the different and diverse strata of gravel in each of his claims, and the true positions of the bed of the old channels. He saw that most of the available red gravel and already been washed away from, not only the ground purchased by the company, but also from the surrounding country which had previously afforded a market for the water supplied by its ditches, and knew that nothing would save the company from ruin, but the opening up of the mines from the very bottom of the deep gravel deposits. This required long tunnels and heavy outlay, but nothing daunted him after he had become thoroughly enlisted for the combat. He selected his objective point for a tunnel at Thompson's hill, which should, when completed, tap the Dutch Flat channel for over half a mile, and also the South Blue to Squeir's canon and beyond. All his work is conducted with excellent judgment, but, of course, he has failed many times in minor details; it would have been a miracle if had not.

The company is deserving of all the praise for retaining him in its employ; but he has nothing to thank it for, for he has made the best interests of the company his constant study, and became so imbued with the spirit of the enterprise and the excitement of gold mining that the company's future prosperity seems to be his only ambition for acquired fame. He is one of the men now opening our mines in proper manner, and in my next I will give a detailed statement of his style and progress as well as his present needs and requirements.

Dutch Flat, September 2d, 1875.



KENDALL'S IMPROVED QUARTZ MILL.

MEETING OF THE REGENTS OF THE UNIVERSITY.—The University Regents met on Thursday afternoon, last, with closed doors. The Finance Committee made a report of the unsettled business between the University and the Bank of California and also the late Treasurer Mr. Ralston, which was found to be substantially in accordance with the statement published at the time of the suspension of the bank, viz., that the bonds of the Treasurer will secure the University against any possible loss. The Advisory Committee of the Board, consisting of Regents Stebbins, Haight, Martin and Moss, were re-elected, and Regent Hager was chosen a member of the same Committee, vice Dwinell, resigned. A Committee of three to draft resolutions in regard to the death of Regent Ralston was appointed, consisting of Regents Winans and Stebbins and President Le Conte.

ACADEMY OF SCIENCES.—The Academy of Sciences held a meeting on Monday evening—Vice President Edwards presiding. Thirty-four four members were present. A large number of donations to the museum and library were presented. Mr. Edwards spoke of his recent visit in the vicinity of Mount Shasta, and particularly with regard to the California pitcher plant, the *Darlingtonia*, which he found there in great abundance. Joseph O'Connor, J. P. Moore, and G. H. Saunders were elected resident members. The meeting then adjourned.

Kendall's Improved Quartz Mill.

Stephen Kendall exhibits, at the Mechanics' Fair, a novel quartz crushing machine, constructed on a principle different from anything now in use. The accompanying engraving will convey a clear idea of the details of the machine to those who have not examined it. The machine is a double acting quartz battery. Two ordinary mortars are placed in a frame, a short distance apart. Between these two mortars are suspended, by a journal on the rock shaft, swinging frames, *B. B.* The stamps, *A.* are joined to the swinging frame, *B*, as shown. The cams *C*, are arranged in the usual manner, in the cam shaft, the power being applied by the usual pulleys. The standards, *D*, support the whole arrangement, carrying with the rock and cam shafts, *f*. is the shoe and *e*. the die, as in an ordinary mortar.

Each end of the stamp, *A*, is supplied with a shoe, *f*. When the power is applied by steam, horse, water or hand power, the cam shaft rotates. The cams strike the tappets on the opposite sides alternately of the oval frames, *B*, throwing them back and forth, producing a swinging motion which causes the stamps to alternately strike in the mortars. Thus one rotation of the cam shaft makes the stamps strike a blow in each battery; so that the two stamps make really a four stamp mill. With four stamps an eight stamp battery is made and so on.

Any quartz miner can see at a glance how simply the machine operates and how little there is to get out of order. It takes very little to operate the contrivance and there is no extensive frame and complicated machinery about it. It is quite compact, and its weight and cost, as compared with the old style mill doing the same work, is much cheaper.

The four stamp mill of this pattern could be put on a wagon, frame and all, and it could be set up in twenty-four hours. The main idea in this mill is to provide a practical, cheap quartz mill, which will answer the purposes of working miners with no capital. There are hundreds of mines in the mountains now lying idle which would be worked if cheap reduction works were available. A small four stamp mill of this pattern occupies a space of seven feet by three feet and a half and three feet high. It can be made in small pieces so as to be packed on mules. Mills of this pattern can be made in all sizes from a two stamp up to sixty or more. Frank Huntington, of this city, is now making some of these mills for Mr. Kendall, which will be sent up to the mines in different parts of the coast. A small, practical mill of this sort has long been needed.

Steatite.

I. S. Merrill exhibits at the Mechanics' Fair, infusible stentite felting and steatite paint—the felting and paint being composed of imperishable materials—principally steatite. The felt is for boilers and steam pipes, and, being a positive non-conductor, is naturally a fuel saver. It can be bought by the barrel, and any person with ordinary skill can apply it. Plaster from the mineral is used for stove lining. The fire-proof paint for roofing is made in every color, and readily applied.

This steatite is a hydrated nitrate of magnesia, with a smooth, greasy feeling, like that of soap, and so soft as to yield to the nail. It is a massive variety of talc, which, when pure and compact, is much used as a refractory material for lining furnaces, *being infusible in any furnace*. Heated, it is easily turned in a lathe, or cut with knives or saws, and is made into culinary vessels. When very strongly heated steatite loses the small portion of combined water which it contains, and becomes harder and susceptible of polish. In this state it is made into jets or gas burners, which have the advantage of not being liable to rust or corrode. When reduced to powder it is used like plumbago, as a lubricator and to diminish friction, as well as to give a smoother surface to some kinds of paper hangings. Steatite can be used for paints of all kinds, and is good for ship bottoms, as it prevents the formation of barnacles, and when applied to walls prevents dampness. Applied to roofs it will preserve the shingles and make them fire-proof. Tin roofs coated with it will not expand by heat, or contract by cold.

CORRESPONDENCE.

Resources of the Australian Colonies.

[From our Australian Correspondent.—Continued.]

FURTHER FROM TASMANIA.

MESSRS. EDITORS.—My last letter broke off somewhat abruptly, circumstances preventing my adding the few other remarks, it was perhaps needful to make, in order to give thorough comprehension of the general features of the colony of Tasmania, concerning which I was then writing. Certainly very little remains for me to add, but as that little refers to the mineral resources of the island, it is perhaps somewhat important. Coal, tin, iron and asb stoa have been found in various parts and several companies have been formsd for utilizing them, although up to the present it can scarcely be said that any of them have achieved a financial success. Nevertheless I know for a fact, that many of those concerned in these ventures, and these too, having practical knowledge of the business in hand, are sanguine of ultimate success. There is a mountain of asbestos, and the great difficulty concerning it up to the present time, is to know what to do with it. Here is an opportunity for some of your enterprising countrymen who have a wider experience than we have, and would know how to turn it to profitable account.

Concerning the colonies generally, Queensland and New Zealand seem to be making greatest progress. New South Wales then seems to come next, but inasmnch as thia is due to enormous sales of the public estate, and an equally enormous government expenditure, I am afraid that it is not so sonnd a progression as is being made by Victoria, where manufactnres flourish to a larger extent than anywhere else in Australia. We are now just on the eve of a political crisis. To-night there will be a parliamentary trial of strength between the present government and the protectionists. The government itself, it is whispered, is divided, and so no one can tell which way the battle will go. I should not be snrprised if the government were defeated, and a decided protectionist ministry installed into office. One of the salient points of the tariff as promulgatsd by the present occupants of the treasury benches, is with respect to the article of tobacco. The duties hitherto levied on this article have been on leaf one per cent., and on manufactured tobacco two per cent., the colonial grown leaf being duty free. The result o this has been that a large quantity of the colonial article has been grown, and several factories erected for its manufacture. The quality, which was at first execrable, has gradually improved until it bids fair to pnsh its American rival out of the market altogether in the conrse of a few years. You will learn also from the extract which I enclose you, that the neighboring colony of New South Wales is also growing large quantities of the "noxious weed." The Victoria government now propose to reduce the difference between American and colonial leaf to the extent of six pence per pound, not by reducing the duty on the foreign leaf, but hy adding six pence per pound to it, and imposing an excise duty of one per cent. per pound on the colonial article. The free-traders want the difference entirely done away with whilst the manufacturers desire the differential duties to remain as they are. Other articles of course enter into the discussion, but as this would probably interest many of your readers, I have given you the above particulars. Of the undignified way, in which the Chief Justice of New South Wales has challenged some statements of the governor of that colony, I dare say your newspaper files will inform you; suffice it to say that it has all arisen out of the release of the notorious bushrangsr, Gardnier, concerning whom I wrote you some time since. One important invention has been recently patented here for the care of fluke in sheep. All the experiments up to the present time have proved effectual in killing the paresite. Would this invention be of much importance in America? Another one is for a smelting furnace, more especially for antimony, by which I am assured that one-half the fuel is saved and more than half the time. This assurance I received from a gentleman who had a furnace erected and worked on this new principle.

E. W.

Melbourn, Australie, July 27th, 1875.

TO CLEAN GLASS.—As a rule, warm water and a soft cloth are all that are required to keep glass in good condition; but water bottles and wine decanters, in order to keep them bright, must be rinsed out with a little muriatic acid, which is the best substance for removing the "fur" which collects in them. The acid is far better than ashes, sand or shot; for the ashes and sand scratch the glass, and if shot is left in by accident, the lead is poisonous. Finely cut glass must be cleansed and polished with a soft brush, upon which a very little fine chalk or whiting is put; by this means the luster and brilliancy are preserved.

To Make Lead Pipe Safe to Use for Drinking Water.

It is very generally known that lead is more or less acted upon by drinking water, and thus rendered unsafe to use for conducting the same for any great distance. Tinning on the inside has been employed as a remedy for the evil; but on account of cost or for some other reason, such pipe has not come into very general use. What is supposed to be a better remedy has been patented by Dr. H. Schwartz, of Breslau. His device consists in treating lead pipe for ten or fifteen minutes with a two to five per cent. solution of sulphuret of potassium or sodium, at a temperature of 212°. A boiling solution of sulphur in caustic soda is found to answer the same purpose. This treatment causes the formation on the surface of the pipe of a thin coating of sulphuret of lead.

A strong proof of the insolubility of sulphuret of lead is the fact that water from mines never contains a trace of lead. Still, a doubt might arise as to the equal power of the artificial sulphuret to resist the action of water. Fortunately, here, too, we have experimental proof to rely upon.

The *Chemical Bulletin*, of Paris, refers to a series of experiments with pipe coated after the method of Dr. Schwartz. These pipes were exposed at the same time with other unprotected pipes, to the action of rain water, snow water, distilled water and the city water. On the following day he found a perceptible quantity of lead in the water ran through the unprotected pipes, except in the case of city water, where traces of lead were found after a few days. For three months, however, and in the presence of air, the coated pipes did not contaminate the water flowing through them.

For the benefit of those interested in Schwartz's process, we would say that the details are given in the specification of the patent, No. 1519, of the British Patent Reports for 1863.

Railways at the Centennial.

The managers of the Centennial Exhibition to be held next year at Philadelphia, have closed a contract with a passenger railway company, by which the latter is to construct within the exhibition grounds a double track, narrow gauge road, which will traverse the entire circle between the various buildings, some 3½ miles. The road will be equipped with five locomotives and forty palace cars, tendered the company free of cost by different locomotive and car builders. While this will be a great accommodation in affording means of transit to visitors, it will also be an advertisement to the shops furnishing the cars and engines, and a test experiment of narrow gauge operations. In reference to arrangements of the Pennsylvania railway company with respect to travel to the Centennial, the Ohicago *Railway Review* gives the following snmmary: Elm avenue is the southern boundary of the Park and Centennial grounds. Belmont avenue intersects it and passes between the main exhibition building and machinery hall. Parallel to machinery hall, on the opposite side of Elm avenue, the company will erect a depot 650 feet long hy 100 feet deep, containing no tracks, but simply for tho accommodation of passengers. The eastern end of this depot will not extend to the corner nf Elm and Belmont avenues, but will be about 200 feet west of it. On Belmont avenue, south of Elm, a large temporary hotel will he erected hy private parties, the grounds for which are 900 feet front by 240 feet deep, and do not reach the intersection of the two avenues by about 200 feet. The main tracks of the road cross Belmont avenue at its intersection with Girard avenue, and are below the grades of these streets. A short distance above their intersection they will branch off into the new yard to be constructed. They will be laid out in the form of a circle, about one thousand feet in diametsr, flattened on the Belmont avenne aide. Three tracks will be laid around this circle, and will be used respectively for arriving and departing trains from New York, Baltimore and Washington. The trains from Jersey City will run directly to the Centennial grounds. They will reach them on the north track, and then switch into the yard. In case of the three traine arriving at once, they will run from the main track and he switched one upon each of three tracks composing one circle, the trains stopping on the Belmont avenue side in auch a way as not to overlap each other.

Two passages through the hotsl, 50 fest wide each, loca ed about 200 feet from either end of the building, will allow the paseengers to reach Belmont avenue; and the corner of the two avenues, which will have no buildings upon it, will be floored over, making a wide passage to the intersection, where there will he a large concourse for the strest cars. The trains during the day will run on such time that arriving trains can be immediately reloaded, and for this purpose they will proceed around the circle until they are in the rear of the depot building, on Elm street. To prevent confusion and mistakes occuring in regard to the destination of trains, passage ways will he built from the depot to each of the three tracks, and passengere will thus be assorted before they reach the cars. Three sheds will he built at the sides of the three tracks, but not covering them, to shelter the arriving and departing multitude from the weather. These will he each 1,650 feet long. Trains from Lancaster, Harrisbnrg and the West will strike the circle at nearly the same point as trains coming from the Mantua side, and will go in upon the New York track, running around in the same direction. Trains which do not depart immsdiately after their arrival will go around the circle and be hacked upon some of the fonrtesn sidings which will he built just north of the main tracks. The engine will head east and will not leave its train, but at the proper time for departure will be again pnt upon the circle. Departing trains will always reach the main track from the circle headed in the direction they are to proceed, so there will be no danger for backing trains. West of Fiftieth street, several sidings will be built to carry ont empty boxes from the exhibition buildings, and the Commissioners will erect structnres at that point for storing them. There will be over seven miles of track in this yard.

Regarding the number of passengers for whose transportation provision must be made, there can only he conjecture. The Centennial Commissioners have named 5,000 daily from the New York division of the road. It is calculated that a train can be unloaded every three minntes. Trains of 15 to 20 cars can be run with one engine on the New York division, of abont 12 cars on the Western division, and probably from 15 to 25 cars from the South.

Mr. Stephen's Lifeboat.

Mr. F. Stephen's lifeboat is to start on a voyage to Sidney at two o'clock this afternoon, from the St. Kilda pier. The main features of the boat have already been described. The sides consist of rolls of cork covered with oiled and painted canvas, and the bottom is made of two layers of similar rolls, the outside or nndermost running longitudinally, and snpplementsd in the center to form a keel, and the inside rolls running across the boat. Above there is a deck of canvas to prevent the sea from breaking over the boat. Over all the boat measures fourteen by fifteen feet, and inside the beam is about three feet. It is pointed at both ends like a whaleboat, but is provided with a rudder at the stern, and is ketch-rigged, having a foremaat and a mizenmast, which will carry a jib, lug and mizen sails. A pair of sculls and rowlocks to match are also provided. The masts are of pine, and are stepped into two sheet-iron cases, built ao as to fit into the stern and the bows, and intended to be filled with provisions and water. The boat at starting will be supplied with three weeks' stock of fresh water, that is, twenty gallons, the greater quantity of which will be carried in tin bottles slung to the gunwales, and forty-five pounds of hiscuits, forty-five pounds of preserved meat, and tea and coffee and other comforts. The adventnrous men who are going to nndertake the voyage in this novel craft are Mr. Thomas Leggatt and his son (Thomas Leggatt), both sailors. The sopply of food is calculated to last a month, but as a means of supplementing their stores the men will have on board a breech-loading gun and fishing tackle, and they expect also to be able to catch rain water in the bunt of a sail and convey it by a funnel into the reservoir, if they should feer running short. Included in the supplies are charts, a compass, an anchor, and a cooking appsratus for boiling tea and fryiug meat, and also a spare hilly and frying pan to be used on shore should it be found advisable to land. Of course, only one nf the voyagers can sleep at a time, and he will lie in the bottom of the boat, wrapped in a double blanket, covered with American shiny cloth, such as is used for carriage covers. Mr. Stephen thinks that Sydney will he reached in ten days, or three weeks at the outside, and is sanguine of success. Mr. Leggatt also appears to have every faith in the ability of the boat to navigats the open ocean. He intends to telegraph to Melhonrne on reaching Queenscliff, and also to touch at Wilson's promontory, Cape Howe, or Gaho island and other points, and send messages to Melbourne reporting progress. The enterprise certainly seems a very hazardous one, and, if successful, will establish the capabilities of the invention beyond a doubt as a means of saving life in case of shipwreck. The thing which appears most likely to militate against the success of the expsriment, apart from the question whether the boat can contend with the sea and heavy weather to be experienced outside the Heads or not, is the fact that the voyagers, from the smallness of the boat and the lack of any sheltered "down below" to retire to, will he constantly exposed to the cold and wet, and without means of stretching their limbs except by rowing, unless they should manage to go ashore every now and then, and, of course, frequent landing would reduce the value of the experiment.—*Melbourne Argus.*

VARIEGATED FLOWERS.—A really pretty effect can be produced on any colored flower, peony, rose, fuchsia, etc., making them beautifully variegated, by holding the flower in the hollow of the inverted hands, and lighting a match underneath it, being careful not to let the flower get close enough to get scorched. It is the fume of the brimstone that does it, and the effect is sometimes so startling as to deceive a botanist into thinking he has discovered a new variety. To make a very pretty medley picture, cut flowers and sprays of buds and leaves from the colored plates in floral catalogues, and gum them tastily on white or deliostely tinted card board, in the form of a wreath or bouquet. A rustic frame makes a very satisfactory pictnre of it.—*Floral Cabinet.*

A New Source of Industry.

The New York *Times* tells of a discovery which promises to be of great value to both the producing and manufacturing interests of this country, and which is about to be utilized in India. More than seventy years ago attention was first directed to the properties of a fiber, which to many persons has since been made familiar as the material ont of which the fabric known as Chinese or Indian grass cloth is manufactured. Experiments were soon after made under the auspices of the British Admiralty to test the strength of this fiber, the result of which showed that in whatever way the test was applied, the grass is three times stronger than the best Russian hemp, while it is also much lighter. For all the purposes for which hemp is used, it was admitted to be very much superior. But in consequence of difficulties that arose in the process of preparation, the matter remained a long time in abeyance. It was not until the last Russian war that the subject received fresh notice. International strife has often been the stimulus to new discoveries. When French ports were blockaded, and French commerce was destroyed, in the days of the first Napoleon, French physicians found a good substitute for ipecacuanha, in the root of the violet. Our own civil war stimulated the production of cotton in Egpyt, India and Pacific islands. The Russian war, cutting off the supply of flax from Western Europe, led to the increased cultivation of jute in India, and to its extended use and application. At the same time it turned attention anew to the Indian grass as another substitute, and although it is only recently that any practical results has seemed likely, it promises now to develop into an important source of industry.

In addition to the great strength of the fiber, it has a remarkable power of resistance to the influence of moisture. Compared with other fibers it may almost be said to be indestructible. It is as fine as flax, and presents a glossy luster more nearly resembling silk. Manufacturers give it an intermediate position between animal and vegetable fibers, and those who have interested themselves about it appear to consider it as an equal, if not superior, substitute for flax, and very much superior in every respect to hemp. The chief reason why it has not been sooner brought into use lies in the difficulty that has hitherto been encountered in the preparation. Six years ago the Indian government offered a premium equal to $25,000 for the best machine for separating the fiber from the steme. This was, however, only partially successful. Only one machine was sent in, and that only partly met the requirements. At that time it was thought that only the green stems could be operated upon, but it has since been shown that this is a mistake. The dried stems afford a fiber equal in strength and durability, and only inferior in gloss, and for these the existing machinery for flax and hemp is found to be well adapted. So that while the best cloth will probably be made in India or wherever the plant is grown, the manufacture can be made to succeed wherever the stems are imported. It is the knowledge of this fact that has given a new impulse to the discovery. The Indian government is encouraging the cultivation on a large scale. Within the last few months a great deal of new machinery for the manufacture has been patented. Practical men are busily at work, and in a short time there is little doubt but that manufactured articles from this fiber will be placed upon the market. It is looked upon already as one of the most useful staples, and as likely to take the place either as a substitute for, or in combination with cotton, flax, hemp, jute, wool or silk, and to be valuable also in the manufacture of paper and for other minor uses.

The discovery cannot, however, be regarded as of much value to our people unless the plant can be produced here. If this cannot he done, it will he more likely to benefit the British manufacturer and Indian grower, at some cost to our own. This is, therefore, an important aspect of the question. It is not quite settled whether the Indian and Chinese fibers are produced by exactly the same plants. If they are, which is most probable, the Chinese product has a little the advantage ot the other in the market. This shows that either climate or cultivation has even there something to do with the quality of the fiber. The plant grows very freely, however, in India, and experiments on a small scale indicate that it can be made equally successful in Australia. It also flourishes wherever it has been tried on the coast of the Mediterranean, and some very fair samples of fiber have been grown in the south of France. With care it has been grown in England, but it never can he produced there on any scale for commercial purposes.

It is reasonable from this to conclude that there are many parts of the United States where it could be cultivated on a large scale with advantage. Its production in the South might become a new source of wealth, second only, if not superior, to cotton. It would be necessary in the first instance to start upon practical information obtained in India in regard to the best methods of cultivation. But about this there can he no difficulty, and whether or not it he ultimately found that the soil and climate of this country are suitable, the subject is one which eminently deserves the careful consideration nf persons who are interested in the maintenance of our manufacturing interests.

SCIENTIFIC PROGRESS.

Transits of Venus Behind the Sun.

The observations of the traasit of Vsnus made ia variaas parts of the world last December have addnced, smnng other important data, one fact both novel aud unexpected. This is, that with the pnworful glasses with which the obaervers were provided, the diso of Venus appears clearly defined in black npon the chromoaphere which eurrouuds the sun before the fir.t contact aud after the last. Between the first and eecond contact and also between the third and foarth, whilo the edges of the snu aad planet were appareatly overlapped, the black disc of the latter uot merely atood nnt in stroag contrast on the white disc of the solar photosphore, but the onter portion of the planet was still plainly visible on the reddish backgronnd of the chromosphere. Moreover, when the black disc had entered to at least the distance of its radius on the solar surface, the exterior eegment became surronnded with a thin lamiuons halo, supposed to be dne to the rafraction of solar light in the atmosphere of Veuns.

Tho practical object iu which the observatiou of the phenomena may result is the rendering possible of observations of transite of Veuus *when the planet passes behind*, as well as when it crossss hefore, the suu. For if the very weak reddish light of the chromosphere, which forms the coroaa about the sun, contrasts aeusibly with the black of the planet in coajanctiou, the brilliaacy of the planet in opposition and iu full phaee, will afford even a greater contrast. It is true that the apparent diameter of Veuus is uearly six times less in oppositiou than in conjunction; bnt it is certainly sufficient to render the planet visible as it crosses the chromosphere, and this even when a portion of the solar disc oomes into the field of the telescope. The accuracy of the data obtaiued by these observatious would be about six times less than that of observationa similar to those of laat Decembsr, owing to the greatly iucreaaed distauce of the planet from the earth in the former case. But for the same reasou, the passages behiud would be more frequent, for they take place for oppositiona six times further from the orbital node. This freqnency, M. Philippe Bretou (to whom the oredit of the foregoiag euggestions ie due) thiaks would compensate for t be lack of accuracy; and he further points out that the comparisou of obaervations of transits before and traasita behind might add to the precision of the measures which we uow possess of the elemeuts nf both sun and planet.

The next transit behiud the sun will take place iu 1878, and will be followed by four othere at intervals of eight years, the last occurring in December, 1910. After that year, two centnriee will elapse before auother seriee of eight or uiue passagea will take plaoe, among which seriee two traneits will take place before the sun.

If therefore, there be auything nseful, which seems probable, to be gained by observing these back transits, prepuratione for the next oue ahould uot long he delayed. Four of the presaut series, those of 1846, 1854, 1862 aud 1870, have already passed. They might have beeu ntilized for perfectiug the observations for the trausit hefore the euu of 1874, just indeed as the one of 1878 may yet be with reference to the transit of 1882.—*Scientific American.*

More Applicationa of Salioylio Acid.—The followiug, which will be both new and iuterestiug to many, ia communicated to the *Pharmaceutische Zietung* by Niemer, a pharmaciat of Munster. It also afforde further proof of the valne and importance of this new eubatance. It is too well known that the preservation of recently expressed lime juice is a great diffioulty to pharmacists. According to two experiments, 0.25 of a gramme of salicylic acid will prevent the development of fungi in three ponnds of fresh lime juice, the latter being in a half-filled flask. A trial made under aimilar conditious, but without the salicylic acid, resulted in the formation of mould in ten dsys. It was also found that cream which refueed to churn could readily be made to do so by the addition of a vsry amall quantity of this acid.

Animal Phosphoresoence.—Mr. Phipson recsntly read a paper before the British Science Association, iu which he described the discovery of a luminous principle which he called "uoctilucine." He describee it as a fluid organic snbstance containing nitrogen, which in lnminons auimals is produced by a special organ as fast ae the animal requires it. Dr. Phipson has for many yeara made animal phoephoresoence a special study.

Government Aid to Medical Science.—By a vote of 138 to 27, the Englieh House of Commoua recently granted two thousand 'pounde sterling for medical researohee. Our own govsrnment, we believe, has uever yet contributed a dollar in aid of medioal science, the first and most important iu which muu ie engaged. Millions have been spent in other soientific reaearohes. Why is this so?

The Solar Atmosphere.

Prnf. S. P. Laugley rsad a paper at the late mseting of ths Americau Association for the Advancement of Science, in which he said that it had long been nbserved that the snn is not everywhere eqnally bright, and that especially the edge is less luminous than the centsr. It is evident that this diminution of light must be dnè to some absorbiug medinm, alace a self-lnminons globe would appear everywhers equally brilliant, so as to present to the eye the appearance of a flat disc. If the snn has an atmosphere exteraal to its lamiuous photosphere this atmosphero will presenl an obstaole to the emiesinn of the solar rays, eveu if they they are not directly visible. The obetacle will be greater in proportion to the iucreasing angle at which the raye leave the surface of the sua. The atmosphere, however, cannot be seen with the spectroscope. Laplace has calculated that only oae-twelfth of the solar emission of raya reach us. If true, this would be nf great importance.

But more recent astrouomers have made new observations without corroborating the atatement of the illustrions Fraohmau, aud without agreeing among themselves. M. Secchi, for instance, calculates that the absorption near the edgo is fifteen times greater than that stated by Arago. Tbe essayist made hnndreds of observations, and invented and explained a uew aud somewhat complicated instrumeut to assist him. The reeult was the discovery that tbe blackest part of the snu was only eo by contrast—in fact was fonnd to be very brilliaut, and from 5,000 to 10,000 times strouger than the light of the fnll moon. His conclusion is the approximate truth that the solar atmosphere absorbs abont one-half of the solar rays, aud that all auimal life on the earth must be extinguished should that absorption be increased or diminished in any respectable degree. We should be deetroyed either by heat or by cold. Ae we are not aware why this danger shonld occnr, aatrouomy is equally unaware why it should be bronght about. The easay and the essayiat'e instrameuts excited much interest.

Origin of the Diamonn.—The *Scientific American* speoulatea as to the origin of the diamond as follows: The diamond has probably proceeded, like mineral coal and oil, from the slow decomposition of vegetable material, or even from auimal matters, either soarce affording the reqnisite carbon; but it has beeu formed under those conditione as to heat that has produced the metamorphism of argillaceous aud arenaceous schists and auriferoue quartz veius, since it is found exclusively iu gold regions, or in the eands derived from gold-bearing rocka. The schists that were altered at the time may have previously beea shales impreguated with petroleum nr other carbonaceous substauces (hydrocarburets) of organic origin. Chancourtois obeervee that the formation from a hydrocarbnretted vapor or gas ie analogous to that of eulphnr from hydroanlphuretted emanations. In the oxidation of the latter by the hamid process, the hydrogen becomea oxidized, and ouly a part of the sulphurons acid, the rest remaining as sulphur. So in the humid oxidation of a carburetted hydrogen, the hydrogen is oxidized, part of the carbon becomes carbonic acid, and the rest remaine as carbon and may form crystallized diamoud.

Analyaia of a Human Body.—Dr. Laucaster, of Londou, recently analyzed a man, and presentsd the reeulte of his investigation in palpable form to his audience during a late obemical lectnre. The body operated npon weighed 158·4 lbs. The lecturer exhibited upon the platform 23·1 lbs. carbon, 2·2 lbs. lime, 22·3 ozs. phosphorus, and ubont 1 oz. each sodium, iron, potassinm, maguesium and silicon. He apologized for not exhibiting 5,595 cnbic feet of oxygon, weigbing 121 lbs., 105,900 cubic feet of hydrogen, weighing 15·4 lbs., and 52 cubio feet of nitrogen, likewise obtained from the body on account of their great bulk. All of these elements combine into the following: 121 lbs. water, 16·5 lbs. gelatin, 132 lbs. fat, 8·8 lbs. fibrin and albnmeu, 7·7 lbs. phosphate of lime and otber mineral substanoes.

Fallino of European River Levels.—Accurate observatione during the last fifty years have shown that the water level of the rivers Elbe and Oder has fallen aeventeeu inches, that of the Rhine twenty-four, of the Vietula twenty-six, and that of the Danube as much as fifty-five inchee at Orsova. And there is a similar decrease iu the water supply from aprings in Germany. The canee of this decline is attributable to the present reckleas cutting down of forests, as also to the artificial drainage now so gnerally adopted by farmers.

The Most Brilliant Artificial Light.—Fill a emall vessel of earthenware or metal with perfectly dry saltpeter or niter, press down a cavity into its eurface, and in this oavity place a piece of phosphorus; igaite thia, and the heat given off melts a sufficient quantity of the niter to evolve oxygen enough to combine with the phosphorna, and the effect is to produce the most magnificent whits light which chemistry can afford.—*Photographic News.*

New Observatory at Vienna.—A new observatory has lately been erected at Vienua, on a scale corresponding with the moderu requirements of astronomy, whioh are so different from what they were a century ago.

MECHANICAL PROGRESS.

Trial of the Walking Locomotive.

We have already alluded to the singularly devised French machine, termed a walking locomotive, designed for use on railroads iustead of ths original locomotive and also in place nf the ordinary road engine. Its propulsion is produced by the rising and falling of six articulated feet, which strike the ground nr rails something like the feet of a qnadrapod. These feet are arranged in two groups: three support the fore part of the machine aud the other three the after part. The two middle feet are connected together by a horizontal sbaft; tho four others are indspendent, and strike the ground succeesively in ench a manner that while the middle feet move at a moderate pace the others have a highly accelerated motion. Each of these groupe of three feet are affixsd to a siogle trnnk. The force of the steam is applied ia ench a way as to drive these feet toward the gronud.

Au exporimental trial of thie eiagular machiue made by the Eastern railway company, at Parie, has demouetrated that whsn the "feet" are shod with eoles of india rnbber weighing two and one-eighth pounds, an adherence to the rails or road is obtained eqaal to *three-fourths* of the weight of the machiue itself. In the ordinary locomotive thie adherence does not go beyond *one-fifth* of the weight of the machine; it may be added, that this adherence is, iu point of fact, variable; on wet or damp rails it ia uot more than one-half; but in the newly inveuted locomotive of M. Hermann, the state of the rails or ground will alwaye have au influeuce, as iu the case of the machinee in actual use, but it will always be greatly auperior. The experiments made thns far prove that this uew machine will drag ou ordinary roade or on rails a train four timee as heavy as the ordinary trains; the cost of this augmented train will not, it is said, vary materially from that of the ordinary machines with the usual trains wheu nsed ou eqnal grades, but the increased adhering power of the locomotive will permit of the omployment of a lighter built machiue for the usual traius as well as the power to surmount steeper gradea than are usual ou the railways of the present construction.

Thie new syetem eularges very greatly the capacitiee of all locomotives for ordiuary reads, and will allow of passing through grounds where roads have not been conetructed, and up grades of one foot in ten, which are by any of the actual inventions imposeible to surmouut.

It ia expected, saye the *Ironmonger*, an English journal, that a committee of the French Academy will soon report fully upon the practical value of this inventiou, and if it hae iu point of fact all the above-mentioned advantagee in their opinion, also if its constructiou, which is it appears rather complicated, is easy to keep in good order, and also if the cost of the machines and repaire are not too excessive to prevent ite coming into geueral uee, it would aeem, at least, that there is a very remarkable progrese about to be realized in the application of eteam power to small local railwaye, and those paaeing throngh hilly and mountainous districts of the great main routes of travel and traffic.

Tempered Steel Brushes.—M. Dumas-Gardeux, of Paris, has introduced a novelty into the metal trade, bruehes formed of tempered steel wire. They are made in numerous forma—for cleaning tubes, sheathing of ships, iron bridges, slnice gates aud all kinds of iron conetruction; they are also made, like the old metallio brushes, circular for polishing and scratching metals, for stoue aud marble, for smoothing flooriug and decks of ships, and for an infiuite variety of purposes. The same maker has produced a new scraper, for the special purpose of cleaning locomotive tube boilera; it is a spiral brush, but in which the steel wire is replaced by pieces of steel spring; it is said to be very effective, and, at the same timo, durable.

Hardening Fine Tools.—It is said that the engravere aud watch makers of Germany hardeu their toole in sealing wax. The tool is heated to whitsness and plunged into the wax, withdrawn after au instaut, and pluuged in again, the process being repeated uatil the eteel is too cold to enter the wax. The steel ia said to become, after this process, almost ae hard aa the diamond, and when tonched with u little oil or turpentine the tools are excellent for engraving, and also for piercing the hardest metals. Englieh engravere often use soap or white wax for the same purpose.

New Application of Tin—Steam Boilers.—Messrs. Barret & Rawlings have patented an improved method or means for preserving the interior parts of steam boilers. This iuvention consiste in substituting a special kind of metal—pure tin—for condenser tubes, tube plates, air-pump buckets, foot and head valves, guarde, and all internal construotioue of marine and other boilers, which will entirely destroy the action that now takes place thereiu by reason of the feed water comiug in contact with the preseut metal surfaces of suoh boilers. And the special kind of metal uow proposed to be used as aforesaid in the conetruction of snch boilers will, by destroying the galvanic action, prevent the destruction of such boilers.

Wooden Rails.

The superlutendent of the Muacy Crsek railroad, Penn., is about to try the experimsnt of laying wooden rails nn that portiou of the road betweeu Hnghesville and Tivoli, or two miles beyond. With a view to testiug the feaibility of woodsn rails, the saperinteadsnt recently had sevsn hnadred feet of track laid on a curve jnst beyond Muucy creek, and to the surprise of all it has besn found to answer the purpose much bettar thsu was anticipated. The rails are of sugar maple, 7x4 inchea, and about 12 feet in length. The tios are laid down in the ordinary way, notched, and tbe raile "let iatn them" about four inches. They are then keyed firmly with wooden wedges driven nn the sides, whioh makes the track very solid and firm. The locomotive aud heavy cara have been paseed over this experimeutal track at different rates of epeed, and it has been fouud to work admirably, and gives every assurance of success. The cost of laying wooden rails, manufactured out of thie hard material, that becomee almoat aa solid ae boue when aeasoned, is $450 psr mile, while iron costs $4,-000. No irou spikee are required, as the rails are secured by wooden wedges, and the cost of track-laying is about the same as puttiag down iron. Woodeu rails have alrsady beeu tried iu different localities, and, we believe, have been iuvariably fouud to work well.

Enamelen Ioon Ceilino.—A ceiling made of thin plates of irou, enameled, hae juet been put up in its place iu the central refreshment room of the South Keusiugton Museum, London, and is probably the first experimeut of the kind. The decorations of thia room were designed to reeist all dirt and impurities incident to a public room where food is eateu by an average of 10,000 persons a week. The walle aud columne are of majo.ica, the floor is paved, and the ceilinga are of irou enameled. The whole givee an impression of perfect cleauliness, and every part might be washed down by a fire engine weekly, if necessary. The enameled plates are painted with charming aud vigorous arabesques, the work is highly effective and the experimeat aucceesful. In cases where it ie necessary to keep a ceiling clean and to wash it frequently, this material promises to answer perfectly, aud the artistio work will last for centuries, as the design is burot into the enamel.

Bridges.—Bridges have absorbed an immense amount of capital within the last ten years, by the extension of railroade creating a direct demaud from the openiug up of new territories to immigrants. It ie estimated that the bridges built in the United States since the war have cost $150,000,000. The West has built the greater number of large and coetly bridges, those over tho Missouri alone at St. Charles, Booneville, Kansas City, Leaveuworth, Atchison, St. Joseph, and Omaha, costing $11,000,000. The Ohio is bridged eight times bslow Pittaburgh, at the cost of $16,000,000. The Mississippi is bridged at St. Lonis, Hannibal, Keokuk, Burliugton, Cliutou, Duhuqne, Winoua, La Crosse, St. Paul aud other places, at a cost of $25,000,000, the half of thie having been expended on the bridge at St. Louis. Philadelphia has during the same time built or completed bridges for mere local accommodutione alone, costing about $4,000,000.

Trial of the Russian Circular Iron Clad.—It will be interesting to many of onr readers to learn that the first of the Russian circular iron clads, the Novgord, has recently made pasaagee iu the Black sea, which, to say the least, fully jnstify the imperial goverument in having adoptsd this form of vessel as one well adapted for providing very powerful naval defenses for certain purposes. She makes a fair speed, and answers her helm perfectly. By her peculiar build she draws less water than any other ship which can be built of her size thickness of armor and armament. She is 100 feet in diameter, perfectly circular and measures 2,500 tons. As an experiment she is pronounced a psrfect success. It is claimed that her manner of build is far more perfect for fighting than the ordiuary shaped iron clads.

Petroleum in Tubning Harn Metals.—M. L. Bechstein reports that it was regnired to turu with the greatest posaible precision a piece of work twenty-six centimetres in diameter, composed of a very hard alloy of seven parts of copper, four parts of zinc, and one part of tin. Every ordinary mode was tried without success, wheu M. Bechstein had the idea of tryiog the effect of petroleum constantly applied to the cutting tools, and the alloy was then turned with abont the same ease as steel tempered to etraw oolor; the latter, says M. Bechstein, turns with the greatest ease when the cutters are kept moietened with a mixture of petroleum and turpsntiue.

New Inoxidzable White Metal.—According to M. Marlio, an inoxidizable white metal may be made of iron ten parts, nickel thirty-three parts, brass twenty-five parts, tin twenty parts, and zinc ten parts. The alloy is cast and cut in pieces, and the latter are tempersd at white hsat in a mixture of sulphuric acid sixty parts, oue nitric acid ten parts, muriatic acid five parts, and water twenty-five parts.

A Winn Turbine has been patented in Denmark. It is eaid to work in a much lighter breeze thau the ordinary style of wiud mill, aud to be well suited to a variety of iudustrial uses.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

California.

ALAMEDA

WORK AT THE LIVERMORE.—Livermore *Enterprise*, Sept. 4: Work upon the boilers, engine, and general machinery of the Livermore coal mine, is progressing finely and will perhaps be completed about the close of the coming week. The dressing up and preparatory work to opening the drifts from the main shaft east and west is about finished, and as soon as the hoisting works are in readiness we shall look for a busy scene in and about the mine. The coal is not to be questioned as regards its quantity or quality, and every man holding stock in the company should feel as though he had a valuable property in his possession. The workmen, from the superintendent down, are men of experience, and fully comprehend the situation, and as soon as the present work is completed shipments of coal will commence.

ALPINE.

THE ANVANCE.—Alpine *Chronicle*, Aug. 28: Inaugural operations commenced on this claim on Monday last. A place has been selected near the old Glance tunnel and east of the ledge for the sinking of a shatt, the sinking of which will be accelerated by a powerful diamond drill, which has been purchased at San Francisco and will shortly be on the ground. A shaft will be sunk to the depth of 300 ft, and as much deeper thereafter as may be required. Superintendent Coleman intends pushing this work with all possible dispatch.

THE SILVER CLOUD.—The president and treasurer of this company recently came up from San Francisco and gave the mine a thorough examination. We learned that they returned home well pleased with the appearance of the mine. They have a well defined ledge 20 ft wide. As the company contemplate sinking on the ledge, and the erection of buildings for hoisting works, work has been suspended until early next spring.

THE FLINT.—A fine grade is being made from the main road to the hoisting works of this company. The new shaft is to be sunk by a Crown Point miner, who will probably bring a number of Comstock miners to assist him.

INYO.

THE BRODER FURNACE.—Inyo *Independent*, Sept. 4: The gratifying news came Saturday last that the Broder furnace, at Pine mountain, was making a successful run, the difficulty of properly fluxing the ore so that it would run from the furnace having apparently been successfully overcome. This was the case for a short time, but we are sorry to say, ended by the time 5 or 6 bars of bullion were gotten out. Despite of everything that could be done, the furnace "hanked," and was shut down. But the thing didn't end at that by any means. The only obstacle to perfect success in every way is the seemingly but trifling difficulty of properly fluxing the ore in the cupola so that it will run out, and this difficulty Broder & Moffat will overcome before they quit it, or prove it an impossibility, which it certainly is not. The bullion produced is of high grade, assaying over $450 to the ton.

NEVADA.

COPPER AND SILVER.—Nevada *Transcript*, September 1: Mining matters are looking up around Spenceville, in this county. Several years ago copper was discovered, and it was thought in great abundance. The recorder was kept busy in recording claims; many companies were formed, and everybody who did not own an interest in the copper mines, was considered out of luck. The excitement ran high and a great deal of work was done, and quite a town was started up, when all at once it was found that the mines could not be worked with profit, and the copper mines went out of sight about as quick as they came in. Nothing was thought of that region until about a year ago, when Mr. D. F. Deetken, a good metallurgist, went there and erected a furnace to work the ore, in a way that he had confidence in, and has been successful. A quantity of the ore was sent to Europe for assay, and the returns have been received which proves that it is very rich in copper, and assays as high as $235 in silver to the ton. We presume the excitement will be started up there again, and the mines will be worked in a systematic manner. Many of our people have never lost confidence in the Spenceville copper mines, and they will now go it again and be successful in their investments.

FINE LEDGE.—Charley Moore, of the Union hotel, and Capt. Moore have for some months been engaged in prospecting an old quartz ledge, formerly owned by W. C Randolph and Capt. Day, located upon Deer creek. They procured the hoisting works of the old Manhattan, and under the superintendence of Capt. Moore, the work has been pushed through in the most systematic manner. A short time since they struck a fine ledge, between two and three feet thick which looks splendidly. In many places free gold could be seen, and the rock contains a great deal of sulphurets. A crushing of fifty tons of the rock is now being sent to the Oriental and Murchie mills. The owners are confident that it will pay well. As they go in on the ledge the better the rock looks. They will now drive the work ahead as fast as possible, and before long the rock they will take out will keep a mill running constantly.

KENTUCKY.—*Foothill Tidings*, Sept. 4: Report has it that this week has developed a decided improvement in the ledge opening along the drift in this mine, and stockholders are feeling quite cheerful over the prospect.

DEER CREEK MINE.—This is the name of a new mining enterprise which now looks very promising, situated on Deer creek, about a mile and a half from Rough and Ready, and owned by John Fippin, ——— Muchmore and John Single. Beginning work a few months ago on a mere seam of quartz they have sunk the incline to a depth of 78 ft, at which point, 50 ft perpendicular depth below the surface, they have a fine sixteen inch vein, which is widening as they go down. They have crushed in a hand mortar since they began work, specimens enough to turn ont $426 in gold, and have on the dump about 15 tons of rock taken out of the shaft as they have been sinking, which is estimated by good quartz men to be worth $36 per ton. The ledge has been traced 800 ft along its course, and its owners evidently have a good thing.

NEW QUARTZ LEDGE.—San Juan *Times*, Sept 4: Chas. Wellman brought to our office on Monday last a large piece of quartz filled with virgin gold and sulphurets, taken from a ledge situated near Pike city, in Sierra county. The ledge was discovered by Stephen Spencer and Capt. J. P. Brown of Camptonville, and is known by the name of the Spencer and Brown ledge. The owners are constructing a ten-stamp mill at the ledge, and will soon be realizing large sums of money therefrom. Messrs. Spencer and Brown have for several years past prospected this ledge, but until a few days ago they had struck nothing that would pay. The owners sunk a shaft some 200 or 300 ft in depth and struck a large vein of excellent quartz which will assay from $40 to $50 to the ton We congratulate the miners on their find, and hope they will realize more money out of their claim then they anticipate.

PLACER.

A RICH STRIKE.—Placer *Argus*, Sept. 4: They have struck it rich in Green's mine, having taken out within a few days some of the finest rock ever taken out of any mine in the Ophir district. One small rock was worth several thousand dollars.

SAN LUIS OBISPO.

MINING IN SAN LUIS OBISPO.—*Tribune*, Sept. 4: From present indications mining is to be one of the great sources of revenue in our county. At the present time there are two paying quicksilver mines, turning out large quantities of the liquid metal every week. These are the Oceanic and Lockhart. The San Jose mine is in a fine state of development and promises well. In the vicinity of the Oceanic mine are a large number of mines that give good prospects, but are as yet undeveloped. We recently had an interview with Eugene Gurley, who has given the upper end of the county a thorough prospecting, and reports important discoveries in the vicinity of Sanco Poho creek, about twelve miles from San Simeon. One lode called the Polar Star has been quite extensively prospected. The ore is of the sandstone class, similar to the Oceanic. The indications are that they will get a large body of ore. It has been cross-cut at a depth of 25 ft below the surface, at which point the vein is nine feet wide. Four miles northwest from the Polar Star Mr. Gurley discovered five other lodes, one of which, the Lishon, has been quite extensively prospected with good results. Mr. Gurley has associated with him Mr. P. L. Weimar, the discoverer of gold in California. They have gone to Los Angeles county in the vicinity of Elizabeth lake, at which point there are gold mines. It is their intention to follow the gold belt, hoping it may be found to extend into this county. They will spend two months in this labor, and then return to San Simeon to further develop their quicksilver mines, unless they find a gold mine that will pay better.

SONOMA.

THE OAKLAND.—Russian River *Flag*, Sept. 2: From Wm. B. Reynolds of this place we obtain the following: The Oakland mine, with one bench of retorts, is now filling four flasks of quicksilver daily. From the tunnel there is a drift each way, about 150 ft on a ledge of 17 per cent. ore. A shaft 15 ft by 20 is being sunk in the lower tunnel and is about 60 ft, from which an immense amount of rich ore is being taken. Three hundred tons are now on the dump. Several teams are hauling brick from Kellogg for a large "dry operating" furnace. The contract with Stuart & Co. for the brick is $20 per thousand laid down at the mine. A return load of ore is hauled to the Kellogg furnace, near Kellogg, for reduction. From the ore thus reduced, it is expected that returns will be obtained sufficient to build the Oakland furnace, thus saving stockholders an assessment. Teams are also hauling the fire brick intended for the furnace, together with other material, from the depot at Healdsburg.

VALUABLE DISCOVERY.—The Madeira Bros., of this place, have made a discovery in which they have confidence enough to embark their entire time and available means. About three weeks ago M. Laughlin, living seven miles southwest of town, brought to ther paint shop a small can of pulverized red substance and requested them to make an analysis of it. They found it to contain about 88 per cent. of iron, and to be that valuable substance, peroxide of iron, of which four high priced paints are made, Indian red, Royal red, Tuscan red and Prussian blue, costing at wholesale 15 to 25 cents per pound, which would make the substance worth from $300 to $500 per ton. The three gentlemen named own the entire ledge, which is inexhaustible, and propose to put up a mill on the mine, and prepare the paint for market. It is believed that this is the only mine of the kind on the continent, except one in Nova Scotia. Specimens of the rock and paint are now on exhibition at the Mechanics' fair in San Francisco, and attract much attention.

TUOLUMNE.

MINING ITEMS.—Tuolumne *Independent*, Sept. 4: Water in the Tuolumne water company's ditch, is expected to hold out until the middle of October. They are running a small stream and economizing the supply as much as possible.

THE new five-stamp mill, at Rock gulch, Columbia, commenced to run on Tuesday last. The mine prospects well, the lode being three feet wide at a depth of 75 ft in the shaft.

WATER in the Tuolumne hydraulic mining company's ditch, for all mining and irrigating purposes, will last until the middle or last of October. We state this on the authority of M. B. Harriman, Esq., water agent.

IN the Lady Washington mine they have developed a vein six feet wide, showing well in gold and sulphurets.

READ'S claim, above Columbia, still keep pouring out its golden wealth. Last week another pocket was struck which yielded $800. This was just below the one from which several thousands dollars was recently taken.

Nevada.

WASHOE DISTRICT.

CALIFORNIA.—Gold Hill *News*, Sept. 2: The east and west cross-cuts No. 3, on the 1550-ft level, have each penetrated to the walls of the ledge, which, at that point, is 200 ft in width, one-half or more of which is in fine ore. The north drift on this level is steadily advancing, the face still in ore, although not of near as rich a quality as that penetrated for some distance back. A winze has been started from cross-cut No. 4, on the 1500-ft level, to connect with the main north drift on the 1550, when it shall have reached a point under the cross-cut. The face of the main north drift on the 1400-ft level has reached to a point within 100 ft of the Ophir line, the face of the drift having passed entirely out of the ore into barren porphyry. Cross-cut No. 3 on this level is being extended westward, the face still in ore. Sinking the O. & C. shaft is making rapid progress. The new hoisting and pumping machinery will soon be completed and ready to be put in full working operation. The batteries and crushing machinery of the new mill are fast approaching completion.

CONS. VIRGINIA.—Daily yield, 600 tons of ore. The quality of the ore extracted is even better than it has been for some time past. The usual quota of $1,500,000, insuring the payment of the regular monthly dividend of $10 per share, has been made, with a surplus of two days' run of the mills to carry over to next month, notwithstanding a breakage of the French mill, causing a delay and loss of eight days' returns of twenty stamps. The mine exhibits no diminution whatever in either the character or quantity of ore extracted. There are no new developments or changes to chronicle for the week, as there is no prospecting of consequence being done on any of the levels now opened. The C. & C. shaft is being pressed downward with all the energy possible, so as to insure the prospecting and development of the lower levels of the mine at the very earliest day possible.

SILVER HILL.—The shaft is down 110 ft below the third station level, at which point preparations are being made for the opening of a new level. A large sump is being excavated below the new station, as it is expected that when the ledge is tapped on that level a considerable flow of water will follow. The east cross cut from the north drift, on the third station level, is showing some quartz and ore of a very favorable character. The bottom of the north winze being sunk near the Justice line, is also in quartz and ore that promises a valuable development.

HALE & NORCROSS.—The main west and north drifts on the 2200-ft level are each being driven rapidly ahead, without any valuable changes to record. The north drift from the bottom of the north winze has completed a connection with the south drift from the Savage mine, which furnishes a much needed current of air, and is fast cooling the drifts in that portion of the mine. A drift south from the winze has been started to connect with the north drift from the 2200-ft station. Nothing new of any other portion of the mine.

LADY WASHINGTON.—Work is progressing at this mine very systematically. The new wing to the building has been completed, and the painters are giving it the finishing touches. Inside of this wing the massive hewn granite blocks, upon which the new engines are to rest, are all in place, and being smoothed by the stone cutters preparatory to receiving the engine bed plates. The excavation in the shaft for the pump tank, at the 260-ft level, is well under way, and being pushed ahead as rapidly as three cbifts of men can do the work; this will probably be completed next week. The water in the shaft is meantime being held at its present level by the bailing tanks. The clack chambers and working barrels of the pomp, which were received yesterday, weigh 18,000 pounds, and are fine specimens of solid foundry work.

BELCHER.—Work was suspended during the most of the week, pending the putting in of a new gallows frame and the making of other necessary improvements. Yesterday work was resumed at all points in the mine, and as soon as the water in the Carson river will justify, the old amount of ore will be again extracted and milled. The ore breasts on the 1100, 1400 and 1500-ft levels still contain an abundance of ore ready for extraction. Prospecting the 1600-ft level is being prosecuted with all the energy possible.

CROWN POINT.—Owing to a scarcity of water in the Carson river, the yield of ore has been considerably decreased, as there was no more dump room, either at the mills or mine. As soon as the flow of water shall return to a sufficient extent, the extraction of the usual amount of ore will be resumed. Sinking the south winze below the 1600-ft level is progressing as usual, without change of importance to report. The main east drift on the 1700-ft level is steadily advancing toward the ledge.

OPHIR.—Daily yield, 150 tons of ore. This ore is mostly extracted from the 1500 and 1600-ft levels. The ore breasts are looking well and show no diminution in either the quality or quantity of the ore extracted. Work at all points on the 1400, 1500 and 1600-ft levels is progressing favorably. No work of consequence is being done on the 1700-ft level at present, if we except some repairs to the east and west cross drifts. The erection of the new pumping and incline hoisting machinery is progressing favorably.

GOULD & CURRY.—Some trouble is experienced by the giving way of partially decayed timbers in the main shaft, caused by the changing of the air current upward instead of downward, as before the completion of the 1700-ft drift with the Best & Belcher mine. About all the work now being done in the mine is the cleaning out and repairing of the north drift on the 1700-ft level. The drift was almost totally destroyed by the water slacking the sides at the time of the cave in the shaft a few weeks since.

LEO.—Development operations are steadily and vigorously carried on, resulting in very encouraging prospects. The drift north, from the bottom of the winze, is in 31 ft to-day; the ground is pretty hard, but quite dry, and blasts out well. The hanging wall is very smooth and well defined. The ledge matter shows improvement both in character and quality. The ledge is very large, and it is expected that when cross-cuts are run, good developments will be made.

UTAH.—Sinking the main shaft is being pressed ahead with all the vigor possible, the rock in the bottom blasting out quite easy, and the flow of water steadily increasing as greater depth is attained. The flow of water, however, is not so strong but that the pump still handles it with the most perfect ease. Cleaning out and repairing the main drifts on the 400-ft level, preparatory to resuming the developments of that portion of the mine, is making good progress.

IOWA.—The main west drift on the 400-ft level is rapidly advancing toward the main ledge, the face of the drift showing, during the past few days, streaks of quartz and ore of an excellent character. These streaks are undoubtedly but feeders of the main vein, and there is every indication when that is reached that some valuable developments will be made. The upper tunnel under the croppings is steadily advancing, without any change of value to record.

SAVAGE.—Sinking the main incline shaft is pushed steadily forward. Nothing new to report of the north drift on the 2200-ft level. The main south drift on the 2200-ft level has made a connection with the north drift from the Hale & Norcross, giving a fine circulation of pure air, and greatly facilitating the entire work of the lower levels of the mine. Sinking the south winze below the 2200-ft level is making good progress.

CHOLLAR-POTOSI.—Daily yield of ore, 80 tons. No change in the old upper portions of the mine. Prospecting the 1150, 1250 and 1350-ft levels is still vigorously prosecuted with no new or important developments to report. Sinking the new combination shaft is going steadily forward. The erection of the fine, commodious hoisting works building over the new shaft is also making rapid headway.

BALTIMORE AND AMERICAN FLAT.—Sinking the winze below the 400-ft level, has been stopped for the present; in fact, there is but little doing in the mines except the sinking of the main incline shaft, which is being pressed downward at a very rapid rate.

DAYTON.—The water is drained for 50 ft below the third station level in the shaft, at which point the first lift for the heavy Cornish pump is being put in. As soon as the lift is in good running condition the water will be completely drained and sinking the shaft resumed. Repairing the drifts on the upper levels will be commenced immediately, preparatory to a complete resumption of work at all points in the mine.

IMPERIAL EMPIRE.—Prospecting as usual on the 1850-ft level with no new features to report except the connection of the main south drift on the 2000-ft level with the north drift of the Yellow Jacket on the 1740-ft level. This is a very important matter to both of these mines as it furnishes a ventilation without which it was next to impossible to develop either of the mines as they should be.

CALEDONIA.—Sinking the main incline at the old shaft is making rapid progress, the work being pushed with all the energy possible. At the new shaft the speed at which it is being

sunk, is almost unprecedented and reflects great credit on Mr. Lambert, the efficient superintendent. The erection of the new pumping and hoisting machinery is fast approaching completion.

BEST & BELCHER.—The swelling of the ground in the connecting drift with the Gould & Curry mine, on the 1700-ft level, caused by the rise of water at the time of the recent cave in the Gould & Curry shaft, has proved much more disastrous than was at first supposed, and the entire force of the mine are yet employed in cleaning out and repairing that drift.

YELLOW JACKET.—Sinking the north and south winzes below the 1740 ft level progresses as usual. No changes of importance. The main north drift on the 1740-ft level has completed a connection with the south drift on the 2000-ft level of the Imperial, which gives a much needed ventilation of the level and must greatly facilitate future developments.

LADY BRYAN.—Sinking the main shaft is going steadily ahead, the bottom still in quartz and low grade ore. The north drift, on the 380-ft level, is still pushed forward, the face in low grade ore and quartz. The main south drift, on the same level, is advancing steadily along the east wall of the ledge and affords no new or important features.

OVERMAN.—Work driving ahead at the 900-ft level, with no new features to report. The breakage or disarrangement of the sinking pump in the shaft last Friday compelled a few hours' suspension of work in the drift from the 1100-ft station, but it being soon fixed, work at that point has since been pushed ahead as before.

BULLION.—Sinking the main incline is making excellent progress, the rock blasting out finely. Driving the main north drift on the 1700 ft level of the Imperial is making good progress, still following the foot-wall of the ledge. The joint drift on the 2000-ft level of the Imperial is also making fair headway.

SUTRO.—The main west tunnel is steadily advancing toward the vein, the rock in the face being much softer for the past few days. The flow of water is slightly on the increase, and the softness of the rock admits of much better progress than has been made for sometime past.

FLORIDA.—The main west drift at the 400-ft level is now in close proximity to the main ledge, and there has been a considerable increase in water in the last few days. The affairs of the company, as well as the mine itself, are in a very prosperous condition.

JULIA.—There is little or no change to report of the prospecting operations on the 1000-ft level, the face of the drift still being in clay quartz and porphyry. Opening the 1400-ft station is pushed ahead with all the energy possible.

WOODVILLE CONSOLIDATED.—Sinking the main shaft has been resumed, and is being prosecuted with great vigor. There is a considerable flow of water at the bottom of the shaft, but not enough to interfere with the progress.

PICTOU.—The main tunnel is being actively driven ahead as usual, the hank suspension not affecting Picton affairs. The material being passed through at present is easily worked, and no water coming in.

JUSTICE.—The material in the face of the main drift at the 800-ft level is somewhat harder than last week, and some little increase of water is noticeable. Nothing new to report of the old south mine.

MINT.—The shaft is down 805 ft, the bottom still in very encouraging ledge material. The ground is quite soft, and the work of sinking making good progress. No water to interfere.

PROSPECT.—Bottom of shaft in somewhat softer material than last week, with indications of water. Face of tunnel shows better looking streaks of soft, clayey quartz than those mentioned last week.

EUROPA.—Sinking the main shaft is being driven ahead with all the vigor possible, the rock in the bottom blasting out finely, the downward speed being at the rate of 5 ft per day.

GLOBE CONSOLIDATED.—Prospecting the upper portions of the mine, as usual, with no new features to report. Preparing for the erection of the new machinery is making fair headway.

UNION CONSOLIDATED.—Sinking the winze in the east cross-cut on the 1300-ft level is progressing favorably, the bottom still in very encouraging ledge material.

MEXICAN.—Sinking the winze in the ore vein below the 1400-ft level is making good progress. No change of interest to report.

SIERRA NEVADA.—Sinking the new shaft is being pressed with all the energy possible, and is making steady and favorable progress. Driving the south drift on the 700-ft level of the old shaft, has developed nothing of interest during the week. The north drift on the same level is steadily advancing along the ore vein toward the new works. The machinery is all in fine condition, and the development of the lower levels is progressing as rapidly as it is possible for such work to be accomplished.

SOUTH COMSTOCK.—The cross-cut at the 275 ft-level is in 123 ft to-day, and the face is in somewhat softer material than last week, with more quartz coming in. Water decreasing.

AMAZON AND GLASGOW.—Everything working finely. The shaft is going steadily downward, and the winze below the first station is still in quartz and ore of a fine character.

DANBY.—It is the expectation soon to resume sinking the shaft. The improvements and repairs to the machinery and hoisting works are about completed.

WEST BELCHER.—Work making very favorable progress, indications excellent, the ledge well defined, and the superintendent expects soon to be taking out ore.

NORTH CONSOLIDATED VIRGINIA.—Sinking the shaft progresses at the same energetic rate as heretofore, and the new machinery works splendidly.

PHIL. SHERIDAN.—Grading and preparing for the erection of the new steam hoisting machinery with all the vigor possible.

NORTH CARSON.—Fine indications in the face of the main west drift, and the main ledge itself must be close at hand.

ROCK ISLAND.—Sinking the main shaft and prospecting the 450-ft level as usual. No important changes to report.

ORIGINAL GOLD HILL.—The drifts and crosscuts in both the ore bodies, north and south, are showing well in good milling ore.

NEVADA.—Face of cross cut all in good milling ore. It is evidently getting into something very interesting.

NIAGARA & MONUMENTAL.—Sinking the main incline is going rapidly forward, the bottom still in favorable ledge material.

COSMOPOLITAN.—Face of main tunnel still in milling ore, and pushing ahead at a lively rate, following the vein.

NEW YORK CONSOLIDATED.—Placing the heavy new machinery and the other work at the surface makes very good progress.

OCCIDENTAL.—Still cross-cutting and prospecting the lower tunnel level, with nothing new to report.

Idaho.

BELLE PECK.—Owyhee *Avalanche*, Sept. 1: The ore taken out of this mine for the past few days has exhibited a degree of richness almost unequaled in the history of mining on this coast. A. J. Sands, a veteran in the business and one of the oldest miners in this section of the country, pronounces the development a most remarkable one. Samples have been examined by other experts, and all agree in the opinion that the vein is one of the richest ever encountered in the camp. Hitherto the operations of the mine have been somewhat limited. There has been but a small force of workmen engaged. For the past few days the ore taken out by four men only will figure up a daily product of ore valued at $2,000. There are now about twenty tons of ore on the dump, and we have the assurance of a gentleman thoroughly competent to judge that it will average $500 to the ton. Gold predominates largely in much of the rock, and many of the samples that have been brought to town seem like solid chunks of the precious metal itself.

ORO FINO.—The quality of the ore taken from this mine continues to be equal to the developments hitherto reported, and has a most promising appearance. The shaft is down a distance of 300 ft, and in a few days the Burleigh drill will be in operation, the battery and exploders, by some mistake, not having yet arrived. Some inconvenience has been experienced the past week by reason of a short supply of water, a defect that will be remedied next week. There are upwards of 70 men at work in and about the mine, and the operations are being pushed with the same energy that has characterized all the movements of superintendent Catalow in connection with the management of the Oro Fino. From 30 to 35 tons of ore are being daily hauled from the mine to the South Chariot mill, which is crushing at the rate of nearly 20 tons a day.

GOLDEN CHARIOT.—The extensive works in progress at this mine show that everything is being done with a view to a full development and enlarged operations in the future. We learn from superintendent Lennon that an extra force will be put at work next week, and ore will soon be extracted in large quantities. Some work is being done at present on the second level, the chutes are being made for a vigorous fall campaign in operating the mine. The foundation for the new works is nearly completed, an immense quantity of rock having been taken out in the accomplishment of this undertaking. The main building of the new works will be 55 ft wide and 90 ft long. The carpenters will be at work on it next week. Nearly all the machinery intended for the works is on the ground, having been brought over from Flint within the past four weeks. The boiler is 16 feet long and 50 inches in diameter, with an engine bed to correspond in dimensions. The fly wheel weighs nearly eight tons. Another boiler will arrive in a few days. The running gear required is on the way from San Francisco. The heavy timbers needed for the hoisting works are on the ground, and 50,000 ft additional to be used within the mine.

ILLINOIS CENTRAL.—In addition to the improvements already inaugurated at this mine, a new quartz house has been partly completed and will be pushed forward without delay. Its dimensions are 45x30 ft. The new tank used in connection with the works is fourteen feet long and six and a half feet in width. A new blacksmith shop and other improvements soon to be started will complete the external works at this mine, which will bear comparison with any outfit of the kind in camp. Twenty tons of ore are being daily shipped to the Cosmos mill, and the improved system of preparing the ore that comes from this mine, by means of the use of sluice boxes, seems to be attended with many advantages. Mr. Dixon, the acting superintendent, informs us that the developments of the past few days continue to be the most encouraging.

PAUPER.—The drifts north and south on the ledge in the 4th level, in 12 ft in one direction and 8 ft in the other are, so far, looking splendidly, the ore throughout being of the same rich quality as that which has characterized the developments of this mine for the past few months. Superintendent Crutcher states that the mine wears a more promising look than it has at any time previous, and is very sanguine as to the most favorable result of the operations in the near future.

SILVER CORD.—The ledge at the 4th level is rapidly improving in appearance and getting constantly larger towards the north and better as the work progresses. It has been opened up a distance of 100-ft and shows good ore all the way. Superintendent Corey regards the development as a most promising one and has greater faith than ever in the future of the mine. The new machinery is nearly all on the ground.

SOUTH CHARIOT.—The prospects of this mine are growing brighter daily. The completion of the winze from the 9th to the 10th levels shows a good ledge and good ore the entire distance. Drifts are being run both ways on the 11th level. In the north direction the indications are very favorable, affording the best evidence of the continuation of the rich ore shute from the 9th to the 10th. All the indications point to favorable results.

IDA ELLMORE.—Cross-cutting will commence next week on the 12th level. On the 13th level there are 25 ft yet to run prior to the commencement of cross-cutting in that direction. The ledge will be cut simultaneously from the 12th and 13th levels.

MAHOGANY.—The mine is looking well, especially in the south section, on what is known as the Dolphin ground. The 7th level drift in that direction is disclosing a splendid quality of ore while general indications are favorable.

The California Rock Drill.

This drill, exhibited at the Mechanics' Fair by Mr. L. W. Coe, is a new candidate for popular favor. It was invented, a short time since, by the gentleman mentioned, and is now exhibited for the first time at any fair. The working parts of the drill are few, and the valve and rotary motion novel. Mr. Coe makes these drills in different sizes, which are shown. The largest drill he has on exhibition is not working. The small drill is mounted on a column and is put at work on a 15-inch block of Rocklin granite. The power is furnished by a Delameter belt compressor, which we described in the PRESS of August 21. The usual pressure of air is 50 pounds to the square inch. The operation of this drill is watched with great attention by an interested but seemingly puzzled crowd, who have a very vague idea of what it is all about and what people want to bore those little holes in rocks for, even in mines. The suggestion that the holes are only bored for the purpose of putting powder to blast the rock down, may help some of the crowd out in their conjectures.

Mr. Coe has mounted on a small block of stone a handsome little brass drill, which he calls the "Lady's Drill." It is only a model, with a cylinder one inch in diameter and an inch and a half stroke, yet it works with most surprising speed and regularity, forcing its way through the stone. This little model was made by Moreau & Haggerty, on Commercial street, and is as perfect a piece of machinery as the large drills, and, of course, more finely finished. The large drills are made by the well known firm of Hawkins & Cantrell. Mr. Coe claims that he can do more work with the "California drill" than any other in the market can accomplish, and that its simplicity in construction and operation will recommend it to those posted on drilling machinery. Mr. Coe will show the internal construction of the drill to any one interested in such matters, and give them all desirable information.

Progress in the Sutro Tunnel.

The following is the report of progress in the Sutro tunnel, for week ending Sept. 1, 1875:

Number of feet in tunnel, August 22	10,563
Number of feet driven during week	103
Distance in, September 1	10,666

REMARKS.—Rock, solid quartz, hard drilling but good blasting. Delayed twenty-four hours laying track, timbering, etc. A quartz ledge was struck August 9th, at a point 10,437 feet from mouth, extending 65 feet in thickness, when 52 feet of porphyry was encountered. At this point another lode, having a width of 112 feet, extending to present face, where the drills have just developed another clay wall; whether more quartz or country rock will follow is not yet demonstrated. The lodes passed through thus far had no value at the point crossed; drifting and cross-cutting is highly desirable and may develop valuable ore. Total progress for August, 370 feet.

[Signed] A. SUTRO, Gen. Supt.

THE Ukiah *Dispatch* says: Some of our citizens are talking of getting up a water company, to bring water from Russian river, six miles from here, in a ditch. Something will have to be done before long, as our population is increasing, and our water privleges lessening each year.

THE FINE DRAWING represented on this page is published in chromo by L. Prang & Co., Boston, who stand at the head of their profession in the United States.

THE direct Atlantic cable is in working order again.

The Habits of the Trout.

The trout is, compared to every other English river fish, exceedingly swift and keen sighted, and this peculiarity is shown in its mode of seizing its prey. The so-called coarse fish, the dace, roach and chub, hang about in shoals in mid water, or nearer the top than the bottom of the river; and when they feed on flies, they lift themselves in a somewhat leisurely, and, as it were, meditative way to the surface, and sink in the insect in a particularly sure and deadly way. If that fly happens to be artificial and to conceal a barbed hook, the very determined manner in which it is seized, and in which the fish slowly turns and sinks below the surface, ensures its being firmly implanted in the leathery jaws of the dace, chub or roach. It is hardly necessary for the "angler" to strike—to give that slight turn of the wrist on which so much depends in fly-fishing for trout. Very different is it with the trout. He seldom disports himself in mid-water. He is serious, and not, like the so-called "coarse fish," a gregarious animal. He loves concealment, and he loves solitude. He lurks at the bottom, in the shelter of some tree root or great stone, or hides from the sun in the deep shadow of a hollow bank. He loves the rush and swirl of a strong current; and his strength will hold him poised with hardly a movement of his muscular tail fin in a rapid that would sweep the weaker fish down stream in a moment. In such haunts he waits and watches for his prey as it comes hurrying past him in the running water. He is not particular as to what it is, provided it be only animal food; he prefers it if it has life and movement in it; he finds his prey among the teeming insect life of the river itself, among the larvæ of the innumerable kinds of *Ephemeridæ* and *Phryganidæ*, the creepers and water crickets, and among the May flies and stone flies into which these creatures develop. He devours the loach, and the bullhead, and the minnow, the young of every fish that swims, the fresh water shrimps, and even the water beetles; nor does he neglect the waifs and strays of his native stream, its varied jetsam and flotsam, the caterpillars and tree insects that are shaken by the wind off the tree branches on the bank, and the worms and slugs that are swept down in flood time from the meadows. From his hiding place his keen glance catches sight of every insect swept past him in the eddy, of the tiniest minnow swimming through the broken water; and he darts with a rush too quick sometimes for the human eye to follow, out through several yards of water to seize his prey. His rush is impetuous, and his haste will sometimes cause him, when he has detected the artificial nature of the bait, to strike against it and, become pierced with the hook—to be "booked foul," as the anglers say. Other he stops in time, and refuses to take the bait. This keen sight of the trout, and the distance from which his rush is often made, are one of the first lessons the angler has to learn.—*The New Quarterly Magazine.*

THE CALIFORNIA PRISON COMMISSION.—The regular quarterly meeting of the Board of Trustees of California prison commission was held on Tuesday evening. Committees on nominations and amendments, for the annual meeting to be held in November, were appointed. Robert Beeching, the General Agent, read his report for the quarter, which shows that he had met 273 different prisoners, and had assisted 25 by supplying them with legal counsel, 43 with board and lodging, 86 with small sums of money, 6 with clothing, 59 with means to leave the city, 18 by securing their release, and 19 by procuring for them mitigation of punishment. He had received 148 visits from discharged prisoners, and has himself paid 78 visits to the City Prison, 31 to the County Jail, and 3 to the State Prison, and has written 50 letters for prisoners. He gave encouraging statements of his work and of its results, but remarked that he was much embarrassed by the want of money to operate with. Numerous cases were reported showing the necessity for continued efforts in behalf of discharged prisoners who wish to reform and become honest men. The condition of the City Prison, notwithstanding the efforts made to keep it decent, was severely commented upon; also the overcrowding at the jail and State Prison.

Industrial Items.

THE managers of the Santa Cruz and Watsonville railroad having negotiated a loan sufficient to complete the road and equip it fully, work will be prosecuted vigorously upon the line. A large force of graders, bridge-builders and track-layers will commence operations on Monday, as the intention is to have the road in operation prior to the setting in of the rainy season.

THE Butte *Record* of the 4th inst. says: Last Monday, chief engineer Ball, assisted by Messrs. Wetherbee and Arents, tested the the forcing capacity of our new water works. The trial was a very satisfactory one, the water being forced through a fifty-foot section of hose, a distance of about sixty feet.

THE Santa Cruz *Sentinel* says that the flume has reached Felton, and the transportation of lumber therein will soon commence.

A TELEGRAPH line is to be established from Chico to Big Meadows.

THE Santa Rosa Palace hotel will be completed by the 18th inst.

A NEW Roman Catholic church is being erected at Lompoc.

The Betts Spring Company.

The Betta spring company, of San Francisco, make a display at the Mechanics' Institute Fair, which is a credit to the State.

The company make all kinds and classes of carriage and wagon springs, samptes of which are shown in the Pavilion. Those exhibited strike the observer as bsing very highly and handsomely finished, and wsll made. The trade in these springs extends north to Victoria and across ths ocean to Japan, where springs from thia factory have been sent.

The springs are all mads of the hest refined English stesl. It is imported in long bars from one and a half to four inches wids, the edges being slightly rounded off, ready to make into springs. As some may be interested in knowing how these springs ars made, we will give, briefly, some idea of the processs: The steel hsrs are brought in at ths front door of the factory and placed in racks according to size. A workmsn takes these hars and a machine onts them into propsr lengths for the leaves. The leaf then passes to the furnace, where the ends are heated and drawn out by a machine, requiring very little finishing by the mechanic. Esch snd of the spring is thus drawu out thin, lsaving a taper from the center to the ends.

The ssme machine which draws ont tbese ends also puts the "lip" on the spring. This "lip" is an improvement of Mr. Betts', which is a very important one. Formerly, in placing one leaf above another it was necessary to keep them in position to cut two slots and punch two teats in each leaf, which, of conrse, weakened the spring. Each slot was about half an inch long, and, in making the two in each leaf, the pisoe of steel was frequently broken or weakened. These were necessary to keep the leaves in place. The teat or projection on each side of the center of the leaf fitted into corresponding slots in the leaf below it, thus preventing the leaves from getting out of position. The "lip" invented by Mr. Betts is much simpler, and answers the purpose just as well without weakening the leaf. It is nothing more than a slight projection formed on the side of the spring, a short distance from each end. This heing formed on each leaf, laps down beside each lower leaf, each one assisting tokesp the] other in position and preventing any lateral motion whatever. The bolt, which paases through the center of the spring, holds the lsaves together, and the "lips" and bolt combined give solidity to the atructure. Thus these "lips" do away with the slots and "teats." The experience of the factory ia that no spring has ever given away where the lip is, although, in the case of the slot, a large percentage was lost. The machine for forming this lip waa made from plans of Mr. Betts'.

After the lip is formed and the ends drawn out the leaf passes to the grinding room. Here are three huge grindstones rnn hy steam, the operators grinding np the ends to "point" them out, and taking off any ronghness. The leaves then go to the fitting shop, where they are aet and carefully tempered. They are then sent to the finishing room, where the parts that show are polished up and finished. Every spring, large or small, is carefully tested before it leaves the shop. A heavy beam is arranged as a lever, and the spring is squeezed together tight aeveral times, so if there is any defect it will be eeen. A flaw of any kind condemns the spring and the steel. If a slight crack is made in a bar it is condemned at once and discarded, beng sold as old scrape.

The operations of the shop are very systematio. Most of the machinery ia of their own construction and design. The furnacea are so arranged under the boilers that their waste heat goes far to furnish the steam reqnired for the 20-horse power engine, which serves the shops. In the fitting shop the tempering furnace is made in two parts, one step above another; sn arrangement which furnishsa work for two more men with very little more expenditure of fuel.

These works were eatablished seven yeara ago, with a man and a boy as employees. They now have $50,000 invested in the business and thirty men at work. The works are at No. 218 Fremont atreet, and cover a space 75x125 feot. The business hae beeu eatablished simply on the quality of tho work, as they have not gone outside for any help. They have succeeded in driving out imported springs, for wherever their work has gone it has taken the place of others on thia coast.

They now aupply the Kimball manufacturing oompany, Carvill manufacturing oompany, and in fact all the wagon and carriage makera of the city with their springs. They last week completed a $30,000 order of car springa for the Central Pacific railroad company. They are now kept so busy that little stock is held on hand, moet of it being order work. Some very heavy springs are made here for butcher wagons, etc. These springs are made in two elliptics of thirty-eight leaves, and made to carry from four to six tons. The long, peculiar aprings shown at the Fair are made by thia firm for Mr. Dolan, of Sacramento, who haa a patent on thia style. They are designed to take the placo of the Kimhall wooden C-spring and thorough brace, and are of similar shape, though made of steel alone. There are only threo leavea in the whole apring.

The company have succeeded so well in their entorprise that thoy are about eatablishing a factory for axles, which will require about $50,000 capital. These axles are all imported now. The industry will give employment to about as many hands as the spring making does, and will be a similar olass of bnsinsss. This inatitution is a flourishing home indnstry, which has hnilt itself up solely on the character of its work, and which is destined yet to assume larger proportions.

Railroad Tracks and Fires.

A correspondent writea ns a note, making a snggsstion as to an apparatus, by msans of which street railroads will not bs interrupted during fires by the hose lying across the track. He suggests an apparatus like the one shown in the accompanyiog out, and describes, in dstail, how it could be made, suggesting, at ths same time, that each car shonld carry a "bridge" of this kind, so as to have it handy to gst over hose which lies across the track.

We publish this as an illustration of how people are apt to think that because they have never seen a certsin device and happen to think of it, that it must, of necssity, he original with them. This "bridgs," spoksn of by our correspondent, is, to spsak fignratively, as "old as the hills," having been in use for the purposs specified for many years. Some of the hook and ladder companies carry them; some of the cars carry them. Thsy have them also at the car depots, fsrry landings and such places as conld be greatly inconvenienced by a "jam" of cars during a fire.

There is notbing new whatever in the suggestion; bnt it is snggested in good faith hy some person who has never asen the device in use. People often hother themselves for montha in perfecting some devioe which has already bsen patented and in nse for years, and then are unwilling to believe that some one is ahead of them, unless forced to by the most positive proof.

We remember once an old gentleman who oame to the patent agency conneoted with this office, who had an automatio switoh for railroads. He thought he had the invention of the age—something before nnheard of, and

"Bridge" for Street Cars to Pass Over Fire Hose.

very valnable. When told that many inventors were before him he was incrsdulons. He aaid they were not in uae in the street railroada in the city; he had examined them. It was with difficulty he was made to believe that there was such a thing as a patsntsd improvement which was not in nniversal nse, and that in many cases old methods were used in preference to an apparent improvement. Thia gentleman had made an expsnaive model, and spent considerable time and money in experimenting with a device that a patent agent oonld have told him was uasless. It is always better, therefore, before having models made and expensive experiments tried, to go to aome reliahle patent agent, explain the device, and see whether there is really anything new and worthy of a patent. A few dollars apent this way may save many which might be spent uselessly. Since tbe patent agency of Dewey & Co. was organized, many years ago, hundreda of men have come to it with inventions they thonght new, but which the experience of the managers enabled them to pronounce unpatentahle.

We have been led to these remarks by the circumstance of our having the ahove mentioned snggestion made; showing that people will often take up an old idea with the impreasion that they have something novel.

Art at the Mechanics' Fair.

The positiou of the fine arts in a community is a good indication of the degree of oulture attained by it. When real merit obtains patronage and bad work is frowned down there will be good artists. When there are good artists the taste of the public is sure to be improved, and more people become interested in Art matters. The opposite state of things will, of course, produce contrary results. The exhibition at the Fair is, therefore, of interest as a gauge of San Francisco's æsthetic status.—if it is just to take the collection as a standard.

If one haa made note of aimilar exhibitions on previous yesrs he will see at a glance that a great step forward has been made, bnt it ia still evident that, as a city, we are more anxious for the appesrance than for the real thing itself. Although much lesa conspicnous this year than formerly, the blanks on the walls and the space occupied by picturea, no doubt placed there to fill up, indicate that our galleries are yet, in the matter of size, somewhat ahead of necessity.

For a local exhibition our local artists are not sufficiently well represented. Thia may be an indication of prosperity or indifference on the part of the artists. They may have heen busy and sold all their pictures, or they may have neglected to prepare for the exhibition. If the former is the case there is an excuse; if the lattor, there is none. It may be that they prefer auhmitting their pictures to the public gaze at the rooms of the Art Association in preference to the Mechanics' Institute; hut they ahould remember that the taste of the multitudo mnst be educated, and no better chance ia offered than at a place like thia Fair. The Art Associstion rooms are freqnented by lovsra of art and people of cnltivated taates, hnt the general pnhlic, the great orowd, do not go there. It is diffsrsnt at the Pavilion, where people of all classes are, for the time, on a social equality, and whsre what ie exhibitsd is for the eye of the poor as well as the rich. We do not mean to infer that the Art Association is only for the rich, but it is, of course, understood that those who visit the rooms are those interested in art only. Here, at the Fair, everyhody comes, and our local artists maks a mistake when thsy ignore the multitude.

The number of good foreign works speaks wsll for the taste of our wealthy men, but we should have more of them. The people who can afford the luxnry of having fine paintings ahould also he liberal enough to give pleasure to the commnnity in which they live by letting thsir art treasures be seen, at least, by those who cannot afford to purchase. If only one good picture were loaned by each gentleman owning a number of them, a very excellent and select collection could be shown.

Some of our citizens have come forward nohly and assisted the committee having charge of the Art Gallery. Others who might be mentioned could have done so, without expense or trouble, had they heen so inclined.

Our local artists who do exhibit will most of them be recognized as worthy of praiss; and we find gratifying evidence that a gonuine advance has heen made, and that in several branches of Art we are worthily repressnted. For so young a city we have done remarkably well, and, as wealth and stability grow, there is no doubt but that San Francisco will fulfill her promise of becoming one of the principal Art centers of the oountry.

Cast Steel Shoes and Dies.

The Cast Steel Shoe and Die Company show, at the Mechanics' Fair, samples of their shoes and dies and alao those of the ordinary kind. The common iron shoes and dies were in the Pacific mill crnshing Belcher ore for 21 days. They sre much worn and broken. As a comparison are placed beside these, cast steel shoes and dios, the shoes of which were 112 daya and the diea 175 daya, on the Morgan mill, working on Crown Point ore. These latter are, of oourse, mnch rednced in size, hut have worn down nniformly, with no eigns of fracture on the edges. To mining men nnderstanding theee thiogs, the comparison ia very greatly in favor of the oast steel shoe and die.

It has heen only a fsw years since cast ateel was nsed for thia pnrpose, although it is strange it never was thought of hefore. In the old way each battery of five stamps nses np, it is stated, about one thousand pounds of cast iron every month. Another great disadvantage is, the small lumpa and pieces of iron which invariably break off the iron ahoes, and which are difficult to separate from the amalgam. The steel wears off so nniformly that the faces may be worn down to an inch in thicknees and still remain in efficient condition and safe from hreakage.

For about two years cast steel shosa and dies have been manufactnred and supplied to the mills. Experiments in the methods of oating, forging and tempering the steel reaulted in complete success, and shoes and dies are now made from ateel which will do the work of six sets of cast iron ones, and costing abont one-half the price. The gnarantee of the company is, that the steel ahoee and dies will, in every case, do four times the work of the cast iron ones and save ten per cent. The advantages of the new aystem are nnmeroua. In the first place there ia a saving of seventy-five per cent. in freight. Then there is large saving of labor and time consumed in changing the shoes and dies, and also of time and inconvenience resnlting from the frequent breakagea to which cast iron dies and shoss are snbject. The difference is best expresaed by stating that a five-stamp battery will crush one ton of rock moro each day when applied with ateel inatead of iron stamps. Thia ia mainly on acconnt of the nniform wearing of the steel, which always offers a trne striking surface, instead of wearing away irregularly as doea cast iron. In view of these many advantagea the stesl shoes and dies have been extensively sdopted in the mills of the Comstock and in the majority of the large gold quartz crushing mills of this State. Among the mills using the improved atamps are the Rhode Island, Douglas, Ramsdell, Pioneer, Petalnma, Brunswick, Woodville, Sunderland, Pacific, Santiago and Excelsior, of Gold Hill; the Sacramento, Eureka and Morgan, also on the Comatock; the Riverside and Knox and Boyle mills, of Sonora; the Greene and Indiana Hill mills, of Placer connty; in the aonthern part of the State, the new 80-stamp mill of the Sumner Co., the 40-stamp mill of the Gold Mountain Co., the two mills of the Surprise Valley Co., in Pansmint, the Chariot mill, of Julian district, and several others; at Grasa Valley, the Idaho and North Star mills; at Sutter Creek, the Phœnix and Lincoln mills; in Esstern Nevada, the Manhattan Co.'s mill, at Anatiu and the Bslmont and Mineral Hill milla are nsing thsm with great success; also, in Arizona, the Fredericks, Gresnwood and Mineral Park mills. The steel atampa are heing universslly adopted in Mexico whsre nnusually high freights prevail.

All the mills using the ateel atamps report thsm superior to iron, and bsfore long we expect to see them introduced into every mill on the ooast. It would be well for mill men and those who are intereeted in the snbject to osl at the office of the Cast Stsel Shoe and Die Co., Room 1, Academy Building, 330 Pine strest and see sample shoes and dies which have been used in wet crnshing for six months and still remain in serviceahle condition. The matter is a most important one to mining men; and those who hsve not alresdy adopted the improved stamps should examine their merits.

Hawkins & Cantrell's Steam Hoisting Engine.

Msssrs. Hawkins & Cantrell, 210 and 212 Beale street, exhibit at the Mechanics' Fair one of the hoisting engines which they maks a specialty of mannfacturing. Their engines are made for mining and wharf purposes or for any place where it is necessary to do hoisting. The engines are made heavisr and stronger than those of Eastern manufacture, it being neoessary in mining work to have them of the strongest and most dnrable character. The large double engines are made with locomotive boilers, and made to hoist from a depth of 1,000 feet. The smaller ones have vertical boilers with aingle engine and reel, like the one exhibited at the Fair.

Several of the largest sizes of this class of engine are in use on the Comstock. One of them, with 8x12 oylinders, ia at work on the Wells, Fargo mine, one on the Iowa and on one the Segregated Gold Hill. That shown at the Pavilion has a cylinder of 6x12.

Engines of thia kind are mainly nsed for prospecting purposes before large and heavy hoisting works are built np. They are made with a solid iron frame and so arranged that the engine can he pnt at work in an honr after arriving on the ground. It only needs a few timbers, upon which to bolt the frsme, and it is all ready. Being much less expensive than heavy large hoisting works, these enginea are in demand for opening minea.

One of the largest aize engines of thia kind haa recently been put at work by the Gold Hill company, at Quartzburg, Idaho. It is a portable, double hoiating engine, with link motion and double reels; is of forty-horse power, occupying a apace of only twenty by fonrteen feet; and one of ita advantages ia that the engiaeer can control the brakes and the hoiating from two separate shafts, and run his engine at ons and the same time. The great convenience of this new arrangement can be seen at a glance by all mill men. The hoisting druma are thirty-two inchea hy three feet. The engine, which is more especially intended for small mines, in so simple that it requires no skilled labor to set it up, aa the boiler and the engins are both within one frame. An engine of this kind can, for five years at least, from the opsning of the mine, keep a twenty-stamp mill at work at an expenae much less than any other pattern.

Hawkins & Cantrell built eight hoisting enginea which were nsed during the constrnctioa of the Palace hotel for hoisting purpoaes. During the year they were used, none of them ever stopped for half an hour for repairs, which speaks well for their construction.

A hoisting engine of this kind was recently arranged hy thia firm in a peculiar manner for McPherson & Wetherbee, for a specisl purpose. When the engine was completed it was bolted on a platform car and geared from the main shaft to the csr axle, so aa to make a locomotive as well as a hoisting engine. When thrown into gear on the cars it hauls a train up to the bank of the river where the bumpers meet heavy timbers, which keep the car in position. This is at the head of an incline leading down to the river on a grade of one foot in five. The gear is thrown off from the car axles and thrown on to the hoiating reel. The locomotive then becomes a hoisting engine. It lowers a car down the incline into the river and a log is floated on to it. The engine then hoists the car and log up the incline, a distance of about five hundred feet. The log is then removed from the car and the operation repeated. When the train is loaded, the gears are thrown from the hoisting reel on to the car axle and the engine becomes a locomotive. It haula the train of logs on the track abont three miles. The loga are then tranaferred into the Inyo river by another incline and floated to the mill. This engine givea complete satisfaotion, since it works well in both capacities for which it is used.

Messrs. Hawkins & Cantrell do a general machine shop bnsinees, bnt make a specialty of these engines. They have been established about seven years, and now give steady employment to twenty-eight or thirty men.

THE Petaluma woolen mill is in successful operatiou, weaving flannels and blankets and spinning knitting yarn. The manufaoture of fancy flannels will be commenced in a few days.

AN Englishman has invented a machine for making hay hy artifioial heat. The coat is seven or eight shillings per ton.

Useful Information.

The Straits of Gibraltar Widening and Deepening.

The straits of Gibraltar, aeweli ae the British ohaonel, are both, beyond a doubt, oceau conquests ovsr ths gradually sinking land. Ths advanoing progress of the ocean in ths former case is abundantly shown by authsntic history. We condense ths following from ths *Scientific American*:

Avienus on the authority of Daemon of Amphipolis, makes ths width of the straits of Gibraltar, at the narrowest poiot, only three miles wide. Then he quotee a subsequeot measurement, by Enotsmon of Athens, who found it four mil.s. Next we find that Scymmee of Chio measured it, in the ysar 143, before our era, and foond it thirteen milssat the Atlantio outlet,whioh now is twenty-six miles in width. Turanius Gracilie, about fifty years hefore our era, givss the width of the narrowsst place, from Mellaria in Spnin to Caps Blanco in Africa, as four and a half milss. Strabo gives the greatest breadth ae nearly seven miles, while Pliny, who had visited the strait, gives it at seven and a half miles for the narrowest part, and about ten miles for the widsst part. Bishop Victor measured the distanoe in the year of our sra 500, aod found it twelve miles; while ths prssent Spanish measursment is fourteen miles.

Avienue also epeaks of two wooded islee in mid channel, on which were built a templs and altars in honor of Hercules. These were the celebrated pillars of Hercoles of ths ancient suthors. The Carthagioiaos "wsre obliged to build flat-bottomed vesssls, so as to ho able to sail over the shnllow watsr of the straits," according to Avienus, who says that Haonibal had reported that theré was "a hottomless and boundless sea farther to the west," which, as it corresponds to ths Atlantio ocean, puts the locality intsnded to be deecribed bsyond douht.

Pliny visited ths straite, aud speaks of a low lying island, covsred with wild olives, and upon whioh were ths rsmains of the Temple of Hercules. Pomponius Mela, a Spaniard, living several centuries later, and to whom these regions were very familiar, describes the straits as a chaunel broken hy a number of small islands. At present they have all disappeared, and the largest shipe sail freely over every portion of these waters.

In 1728, ihere happened a very low tide, and on this occasion the remains of the famous Temple of Herculea were distinotly seen in the oceanio part of the strait, and some soovenirs were even obtained for preservation.

The gradual sinking in this neighborhood is balanced by unheavals in other regions, which are very marked, well established hy observation, and carefolly measured. The northern part of Sweden and Norway are rising steadily. So are the Azores rising, so is the island of Santorin, and ths island of Julia. The former sea port of Aiguee Mortes is now nine miles from the shore while the celebrated Temple of Serapis, at Pozzuoli, for many centuries eogulfed, ie now uncovered, aod is visited by travelers and tourists.

Useful Recipes for Home and the Shop.

Varnishes, Limpid and Flexible.—Anhydrous alumina stereate, dissolved in turpentine, is an artiole much recommended for this purpose, and it is said to he nnalterable et elevated temperatures.

Soldering Without Heat.—Take ¼ of an onnce fluoric aoid, 2 ounces of brass filings, and 1 ounce of steel filings. Put the filings ioto the acid, and apply the solution to the parts to he soldered, which dress together. Take oare to keep the fluoric acid in an earthen vessel.

Handy Soldering of Brass.—Cut a piece of tinfoil of the size of the surface to be soldered; then paint over the surface with a solution of eal-ammoniac; place the tinfoil between the pieces, and apply a hot iron until the foil is melted. Thie is a neat and handy way of soldering small brass-work.

Fire Lute.—Mix thoroughly 2 parts of good clay, 8 parts of sharo washed eand, and 1 part of short etraw or horee manure; temper like mortar. Another: mix linseed or almond meal to a paste with milk, lime water or starch paste. This, it is said, will make a lnte that will stand 500°.

To Give Iron Wiae a Silvery Look.—According to a German recipe, the iron wire is first placed into hydrochloric acid, in which is suspended a piece of zinc. It is afterwards placed in contact with a strip of ziuc, in a bath of 2 parts of tartaric acid diseolved in 100 parts of water, to which is added 3 parts of tin salts and 3 parts of soda. The wire should remain about two hours in the bath, and is then made bright hy polishing or drawing through a drawing-iron. The proce-se can also be nsed for whiteniug other forme of iron.

Black Stencil Ink.—Take shellac, 2 parte; borax, 1 part; soft water, 10 parts, and gum arabio, 1 part; then add lampblack and indigo in sufficient quantities. Boil the shellac and borax in the water nntil dissolved, then add the gum, and withdraw the mixture from the fire. Whsn cold, add the lamphlack to bring it to a suitable color, and lastly a vsry small quantity of finsly powdered indigo to givs it a real jet shsds. When made, keep io glaes or earthenware vessels.

The Earliest Self Rake.—Ths sarlisst instances of a self-scting raks on a reaper appsare in an English patent granted to Mr. Gladstons in 1806. The first acconnt of a machine to reap grain appears to bs given by Pliny ths Elder, who was horn. it is thooght, in A. D. 23. And the first patent for a rs-piog machine was grautsd in England to Joseph Boyce, July 4, 1799, nnd in the United States to Richard Freoch and J. T. Hawkins, May 17, 1803.

Alcohol foa Plant Insects.—The hortioultural journals recommend dilnts alcohol in spraying plants, as being deadly to insects, and convenient to uss, as it quickly svaporates, leaving no trace on ths plants, leaves, or flowers. Ordinary atomizers, are now freely used for spraying house plants, and are found to bs very convenient.

Common coal oil is an excellent mosquito bar. Drop a little on a piece of cotton, squesze as dry as possible, and rub over the exposed portions of ihs body. The smsll of the oil disappears in about five minutes, and no mosquito will alight upon the annointed placss. This is said to he better than pennyroyal essence for the eame purpose.

Varnish for White Woods. — Dissolve three pounds of hleached shellac in ons gallon of spirit of wine; strain, and add one and one-half more gallons of spirit. If the shellac is pure and white, thie will make a beautifully clear covering for whits wooden articles.

To Fasten Wood to Stone.—Melt together four parts hy weight of pitch and ons part wax, and add four parts of brick dust or chalk. It is to bs warmed, for use, and applied thinly to the surfaces to he joined.

An obdurats scrsw may sometimes be drawd by applying a piece of red hot iron to ths hean for a minute or two, and immediately using the scrsw driver.

For Sticking Leather Together.—Melt together in an iron pot equal parts of pitch and india rubber.

Good Health.

Seasonable Food.

The wholesomeness of food depeods nearly ae much on the time it is takeo as on the quantity. We have grown so luxurious in our physical as well as mentnl tastes, thnt we are constantly tempted to eat things out of season. Yielding to the temptation, as we often do,we pay the penalty, soon or late, in temporary or chrooio derangement of our health. Meat which ie excellent in cold, may not he desirahls in warm weather; fish is best during spring and early summer; vegetahlee and fruit are nutritioue when they are fully ripened by sun and season, and not artificially stimnlated. Nature knowe what she ie doing; she furniehes for every latitude. We need variety, not so much at one time, as from time to time. The delicacies of the season will not hurt us; but the delicacies out of season certainly will, if long continued. The appetite so jaded as to crave oysters in July, or strawberries in December, needs careful correction by the adoption of the simplest habits. The palate naturally relishes what nature has near at hend. As a rule, not only is the simplest food the best tood, but the most seasonable is in the long run, the most appetizing. There is no difficulty in determining what we should eat, since the producte of our climate show us plainly month by month. Fish, fleeh, and fruit, by their plumpness, tendernese and ripeness, themselves, denote when they are ready to be eaten. A eound stomach will profit by whatever an unspoiled palate enjoys.—*Scribner's Monthly.*

The Philosophy of Death by Sunstroke.—*Coup de soleil* or sunstroke is thns mentioned by Tanner: "Causaa: In its perfect form, it is met with only in the tropics. It has been noticed that those attacked have often been affected for a few daya previously with snppreesion of perspiration. The nights hnve been sleepless, while attscks of vertigo and a sense of weariness have heen complained of. Such men, too, may have heen irregular in their habits; while perhaps they have also been indulging freely in alcoholic drinks, and prowling ahont under exposure to an almost vertical sun for two or three days previous to the seizure. Symptoms: These are generally faintness, thiret, great heat, and drynese of the skin, with proetration. As the disease advances, the heart's action hecomes violent, the man can scarcely be roused, the face gets pallid and perhaps an attack of vomiting ushers in the stage of coma. The affection sometimes comes on very insidiously. A man will he seen to bs listless and stupid; but he makes no complaint beyond eaying that his head feels a little queer. Yet in twelve houre he may he dead. Dr. Morehead agrees with those observers who refer the phenomena of sunstroke to depressed fnnction of the cerebro-spinal and sympathetic nervons systems. The three most urgent thinge to he performed in treatment are: Cooling the body, removing listlessnese and oppression, increasing the reepirstory actiou.

Salicylic Acid.—Ths following information concerning its uees is furnished hy Dr. E. R. Squibb, of Brooklyn, N. Y.: "It ie used for medical and surgical purposes, either dry or in solution. When nsed dry, it is snrinkled on to wonnds, ulcers, or dreesinge in ths form of vsry fine powder, in very small quantities, sithsr simply powdered, or mixed in various proportions with soms diluent, such as staroh. Whsn nsed in simple solotion, sithsr for spraying surfacss, or for washes or gargles, it is used in tepid solution of ahont ons part to 300 parts of water. Whsre strongsr solutions ars required for washss, gargles, or to moistan drsssings, one part of the acid and three parts of phosphate of sodium to fifty parts of water have heen used. When applied to wonnds it immediately appears in ths urins. Its alleged advantagee over all antieeptics are: Firet, that it is far more powerful and effeotive in emaller quantities; and secondly, that it is, in all quantities necessary for complete effectiveness, entirely devoid of irritant action upon the living tissues. It is not oaustio or corrosive in any quantity, and never produces inflammntion. In large quantitise it may he irritant snd painful, hut yet rarely exceede a stimnlent effect. It appears to he quite neutral in very small quantities, and yet thoroughly effective.

New Burn Mixture.—Take the hest white glue (extra) fifteen ounoes. Break it into small pieces, add to it two pints cold water, and allow it to become soft Then melt it on a watsr hsth, add to it two floid ounoes glycerine and six drachms carbolio acid, and continue ths heat on the water bath until a glossy, tough skin begins to form ovsr ths surface in ths intervale of etirring. The mixture may be used at ouoe, after the glue is melted and ths glycerine and oarholic aoid ars added; bot when time allows, it ie advisahle to get rid of a little more of ths water, nntil the proper point is reaohed. On cooling, this mixtnrs hardene to an elastio mass, coversd with a shining parchment-like skin, and may he kept for any tims. When using it, it is placed for a few minutes on ths water bath, until sufficiently liquid for applicatiou (it should be quite fluid). Should it at sny time rsquirs too high a heat to bscome fluid, this may bs corrected by adding a little water. It is applied by means of a broad brush, and forme in about two minutss a shining, smooth, flexible and nearly traneparent skin. It may he kept for any time without spoiling, in delf or earthen dishes or pots turned upside down.—*American Journal of Pharmacy.*

Asparagus and Celery.—A medical correspondent of an Englisb journal says that the advantages of asparague are not properly appreciated. Those who suffer with rheumatism are cured by feediog a few days on this delicioue eeculent; and more ohronic cases are much relieved, especially if the patient avoids all acids, whether in food or heverage. The Jerusalem artichoke hae a similar effect in relieving rheumatism. It may he well to remark that most plants which grow naturally near the seacoast oont in more or less iodine, and in all rheumatic complaints, iodioe has long been a favorite remedy. One who has been in the drug business, told the writer, some years ago, that many of the patent nostrums which dieinterested people—"for the good of their fellow creatures"—sold at two dollars a hottle, coneisted of a few cents worth of iodine in solution. Iodine is dangerous, however in overdosee, effecting espscially the eye.—*Scientific American.*

The Sea Bath.—The invigorating and remedial effects of sea bathing, when not indulged into exoese, are everywhere recognized. But it is frequently the case that thoee who are in most need of, and most likely to be benefited by the salt hath, are too feeble to take it in the sea, and millions there are who cannot afford the necesaary travel to obtain it. Many so situated sometimes have recourse to a salt water bath, thinking to derive similar beoefits. But as sea water contains several other chemical salts in addition to chloride of sodinm the desired henefits from an ocean hath are not realized. To meet this want, however, a pure sea salt ie now prepared by the evaporation of sea water, containing all the saline metters of the ocean, from a solution of which something very near akin to an ocean bath may be obtained in one'e own bath room, wherever located.

Remedy foa Sea Sickness.—Voyagers, the world over, will remember M. Giraldes in their prayers, if what he claims for a recipe of his for sea sickness ie trne. Having occasion, he says, to frequently crose the English channel, and invariably falling a viotim to this horrid malady, he took a chloral compound with the happiest reeults. Here is the mixture: Chloral, three grammes (forty-five grains); distilled water and currant syrup, each sixty grammes; two drops of essence of mint. Of thie he takes one-half immediately on coming on board, and the rest on the return voyage, and invariably escapes sea sickness.

How to Remove Warts.—Wsrts are not only very troublesome, hnt disfigure the hands. Our readers will thank us for calling their attention to the following perfect cure, even of the largest, without leaving a scar: "Take a small piece of raw beef, steep it all night in vinegar, cut as much from it as will cover the wart, and tie it on, or, if the excrescence is on the forehead, fasten it on with strips of plaster. It may be removed during the day and put on every night. In one fortnight the wart will die and peel off." The same prescription will cure corns.

Domestic Economy.

How to Eat a Muskmelon.—Ao exchange has thie, which comes in play at the present time in our locality: Our readers will probably exclaim, "only give us the melon, and you need not instruct us how to eat it." Yes, but there is a "good, better, best" way of doing things, and we propose to tell you the best way of doing it. Ae Mrs. Glass says in her cookery book, first catch your hare; so ths day before eating your melon, select one, the stem of which is cracking away from the fruit, and which ie also giving out that delicioue aroma peculiar to it. Put it in ths refrigerator until the next day at breakfaet or dinner; cut it in two, lengthwiss, take out all ths seeds, into each half put a tablespoonful of strained honey, and scoop it out with a spoon, dipping each spoonful into the honey, and eat. If, after sating *quantum sufficit*, you do not wish your throat was a mile long, and every inch of it a palate, then we can only say that you are wanting in gustatory taste and our advice is wastsd. Whil we are giving advice, let us add that all fruit is the bsttsr of heing very cold when eaten, ae it brings out the delicate flavor and aroma, and makes it much more refreshing. We do not know of any fruit which is an exception to the rule.

Ham and Eggs.—There is a great difference in the manner of cooking this popular dish. To get it as nice se posoible requiree time and care. The following is suggested as something extra nice: Cut ths ham quite thick—sey one-third of an inch at least. Boil it in plenty of water till harely cooked through, pour off the water, and put the pan in a place just hot enough to brown the fat part of the ham slightly, but not hot enough to make a smoke, or to brown the lean meat much. When this is finished remove the frying pan from the fire, taks off the ham, pour off the fat into a cup, and wips the pan till it shines liks a mirror, without a single speok to mar the polish. Then put in a spoonful of ths clear part of the fat, break in the sggs, and set the pan in a place scarcely hotter than boiling water, cover it and let ihs eggs cook as slowly as posoibls for four or five miuutes, taking them up ae soon as they can ue lifted out. Place them around the the ham, and do not pour any of the fat on the dish. Eet with mashed potatoes.

Baked Peaches—Something Nice.—Cut the peaches in two, remove the stones, having first wiped the fruit well. With a paste cutter (if you want something fanoiful; otherwiee simple squares will do) cut some slices of bread. On each piece place half a peach, skin down; duet well with sugar; put a tiny piece of hutter on each, and bake slowly. When done, dish them and turn the juice over, if any; otherwise add syrup of peare and serve warm. Apricots and prones may he served likewise. The *American Rural Home* gives a method of preparing peaches which will be well to try: Take goodsized freestone peaches, wipe them with a towel, halve them and place them flat side down in hot butter or lard. Let them fry to a nice hrown, then turn and fill the eesd cup with sugar, which, by the time the fruit is properly cooked, will he melted and form with the juice of the peach a rich syrup. Serve up hot, and if you don't like them you need not repeat the experiment. Most persons think the dish a soperb one.

How to Detect Poisonous Mushrooms.—There are several ways of distinguishing mushrooms from poisonous fongi: 1. Sprinkle a little salt on the spongy part, or gille, of the sample to be tried. If they turn yellow they are poisonons; if hlack, they are wholesome. Allow the salt to act hefore you decide the queetion. 2. False mushrooms have a warty oap, or elee fragmente of membrane, adhering to the upper surface, are heavy, and emerge from a vulva or bag; they grow in tufts or clusters in woode, on the stumps of trees, etc., whereas the true mushrooms grow in pasturss. 3. False mushroome have an astringent, styptic and disagreeahle taste. 4. When cut they turn hlue. 5. They are moist on the surface, and generally of a rose or orange color. 6. The gills of a trno mushroom are of a pinky red, changing to a liver color. 7. The flesh ie white. 8. The stem is white, solid and cylindrical.

Fowl Stewed with Oysters—A Nice Dish.—Fill the inside of a young fowl with oystere; put it into a jar or tin pail, tightly closed, and put it in a kettle of water. Boil an hour and a half; there will be a quentity of gravy from the fowl and oysters; add to it a little flour made smooth in a small quantity of water, some butter, seasoning to taste, and more oysters with their liquor. Serve this with the fowl, which will be very white and tender. All the fine flavor lost in ordinary boiling will be preeerved.

Chicken Cheese.—Thie is so nice that every one who eats it once, likes it again. Boil two chickens till tender; take out all the hones and chop the meat fine; season to taste with salt, pepper and hutter; pour in enough liquor they are boiled in to make moiet. Mould it in any shape you choose, and, when cold, turn out and cut into slices. It is an excellent traveling or picnic lunch.

MINING AND SCIENTIFIC PRESS.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Hydraulic Gold Mining; Kendall's Improved Quartz Mill; Steatite, 161. The California Rock Drill, 165. Tin in Australia; Railway Repairs and Management; Metallurgy of the Copper-Silver Ores of Inyo County; Shall California be Represented, 168. The "Devil Fish"; Resources of Yesso, Japan, 169. California Industries; Mysterious Clocks; Patents and Inventions, 172.

ILLUSTRATIONS.—Kendall's Improved Quartz Mill, 161. The "Devil Fish"; May's Combined Mop, 169

CORRESPONDENCE.—Resources of the Australian Colonies, 162.

SCIENTIFIC PROGRESS.—Transits of Venus Behind the Sun; More Applications of Salicylic Acid; Animal Phosphorescence; Government Aid to Medical Science; The Solar Atmosphere; Origin of the Diamond; Analysis of a Human Body; Falling of European River Levels; The Most Brilliant Artificial Light; New Observatory at Vienna, 163.

MECHANICAL PROGRESS.—Trial of the Walking Locomotive; Tempered Steel Brushes; Hardening Fine Tools; New Application of Tin—Steam Boilers; Wooden Rails; Enameled Iron Ceiling; Bridges; Trial of the Russian Circular Iron Clad; Petroleum in Turning Hard Metals; New Inoxidzable White Metal, 163.

USEFUL INFORMATION.—The Straits of Gibraltar Widening and Deepening; Useful Recipes for Home and the Shop; The Earliest Self Rake; Alcohol for Plant Insects; Varnish for White Woods; To Fasten Wood to Stone, 167.

GOOD HEALTH.—Sessonable Food; The Philosophy of Death by Sunstroke; Asparagus and Celery; The Sea Bath; How to Remove Warts, 167.

DOMESTIC ECONOMY.—How to Eat a Muskmelon; Ham and Eggs; Baked Peaches—Something Nice; How to Detect Poisonous Mushrooms; Fowl Stewed with Oysters; Chicken Cheese, 167.

MISCELLANEOUS.—To Clean Glass; To Make Lead Pipe Safe to Use for Drinking Water; Railways at the Centennial; Mr. Stephens' Lifeboat; Variegated Flowers; A New Source of Industry, 162. The Betts Spring Company; Art at the Mechanics' Fair; Cast Steel Shoes and Dies; Hawkins & Cantrell's Steam Hoisting Engine, 166.

CALIFORNIA AND AUSTRALIA.—A. S. Hallidie, President of the Mechanics' Institute, has received a communication from the Agricultural Society of New South Wales, Sydney, which is of great interest to producers and manufacturers. The letter states that the Council of the Society received Mr. Hellidie's letter, in which he expressed his readiness to forward their views relative to a display of farm produce of California for the next exhibition to be held in Sydney, on the 25th of April, 1876. The society returns Mr. Hallidie thanks for the assistance he gave Mr. Westgarth on a former occasion. Mr. Westgarth is about returning to California, accompanied by Mr. Want, a member of the society. Both come here with a view to further increase the friendly intercourse already existing between the Agricultural Society of New South Wales and the Mechanics' Institute. During their stay in San Francisco they will endeavor, by a personal canvass amongst our producers and manufacturers, to cause a fresh and more extensive exhibit to be sent to the next annual show. The letter states that the Council will feel grateful for any assistance Mr. Hallidie may give Messrs. Westgarth and Want in furtherance of the object of their voyage.

MEETING OF THE FRIENDS OF WM. C. RALSTON.—There was a monster mass meeting of the citizens of San Francisco, last Wednesday evening, to adopt resolutions conveying the sentiments in which the late Wm. C. Ralston was held by his fellow citizens. Speeches were made and resolutions, highly eulogistic of the deceased, were unanimously adopted.

THE mail service by steamboats in the Ohio river between Cincinnati and Louisville has been discontinued.

Tin in Australia.

Australia bids fair to become an important tin producing region. The product of that region in 1874, was 11,331 tons of stream tin, which yielded 7,012 tons of commercial tin, the ore having averaged sixty-five per cent. This amount was an increase of seventy-one per cent. over the yield of 1873, which was 4,100 tons. The bulk of this ore was shipped to London for smelting. It was derived from several localities in New South Wales, Tasmania and Queenstown. The latest tin discoveries have been made on the island of Tasmania or Van Diemen's Land, located about 100 miles south of Australia, and directly over against Melbourne. This discovery was made in the alluvial washings from Mount Bischoff, the tin being derived from the disintegration of the granitic deposite of that mountain. Similiar discoveries have also been made in other parts of this island. Up to a late date about 500 tons of ore had been dressed at Mount Bischoff.

Quite recently smelting furnaces have been put up at Launceston, a port near by the Bischoff workings, at which about twenty tons of a very superior quality of tin are turned out every week. The discoveries at Tasmania bid fair to add materially to the yield of tin in Australia. Some of the tin smelted at Lennceston has been received in London, and the quality turns out exceptionally rich. The color is described as bright and pure, and proves by assay to be as high as 99.96 per cent. of fineness. The shipments are expected to be regular, and it is thought that its superior quality will attract the attention of buyers. The sales, so far, are reported at about the price of Strait's tin.

There has been a large increase in the tin product of the world during the five years last past, and a consequent diminution in price, say, in the New York market, thirty-two cents per pound in 1871, to eighteen cents in July last. During the past year, however, there has been an increased demand for this metal, both in Europe and America, and an early advance in prices is confidently predicted.

The consumption of tin in Europe in 1872, was 27,000 tons; in 1873 it was 26,000 tons, and in 1874, 28 500. The consumption in the United States in 1874, 4 629 tons, against 4,313, 5,044, 5,076, 4,118, 3,640 and 3,937, during the preceding six years; making a general average of 4,368 tons per annum for the last seven years.

Railway Repairs and Management.

While much is said and written about the large amount of money employed in constructing new railways in the United States, very little reference is made to the immense amount of money expended, and the skilled labor required to keep in order the railways, which now exist. It by no means follows that when a railroad has been constructed and put in operation that the occupation of the railway mechanic on that road is gone. As long as a mile of railway track remains, just so long will the rail layer, the railway, the locomotive, the car and the bridge builder's services be required on a most extensive scale. The labor and expense of keeping up existing roads probably fully equals in amount the annual expenditures on new railway lines, even in prosperous years of railroad building. The following figures will probably surprise the most of our readers:

During 1873 the Pennsylvania railroad company expended in repairs upon track and rolling stock nearly three and a half millions of dollars. The Philadelphia and Erie company, with a length of track of only 287 miles, expended, during the same year, $796,332 on its rolling stock alone; and the Philadelphia and Reading railroad, for the same purpose and during the same time, $1,636,578.

It has been estimated that not less than three hundred millions of dollars are annually expended for repairs on all the railroads throughout the Union. Fully $20,000,000 of this amount is expended in the single State of Ohio. These amounts, it should be borne in mind, have nothing to do with running expenses. Hence it will appear that should we cease at once from any further extension of our railroad system, the amount of mechanical labor required to keep us just where we are amounts to three times as much as it did to run the entire machinery of the Federal Government before the civil war—the navy and army included. The figures and amounts involved in the railway system of the United States are perfectly astounding, and would have been thought utterly improbable if not impossible a quarter of a century ago.

In no way, perhaps, can an idea of the national progress and wealth of the country be better formed than by a consideration of the labor, machinery and capital involved in the railway system of the country. The question of the control and management of this immense and powerful interest, is becoming one of the very first importance. Its proper management is absolutely essential to national prosperity. The people cannot afford to allow an open antagonism between it and themselves. Railroad corporations are creatures of the government—the people. If they fail to give reasonable satisfaction the power that made must and will re-make, and re-adjust on principles of equity. If the right to do so is out of our reach, we are living under an oligarchy infinitely more dangerous than the most absolute autocracy which exists on earth.

Metallurgy of the Copper-Silver Ores of Inyo County—No. 2.

[Written for the PRESS by SAMUEL PURNELL.]

Hunt & Douglass Copper Process.

This process within the last few years has been profitably used to extract the copper from the pyritons ores at Ducktown, Tennessee; has been worked at Quebec, and has been operated on a large scale to extract copper, gold and silver from the complex ores of Colorado. That it is well adapted to the copper-silver ores of Inyo county, will appear from the description.

The ore is crushed coarsely and roasted till the silver and copper are converted into oxides. This may be done either in the cylinder, reverberatory or muffle furnace. The roasted oxides are next placed in a tank and dissolved in a hot solution of protochloride of iron and common salt. In the reaction which takes place the protochloride of iron is converted into peroxide (which is precipitated), while the oxides of copper are changed into protochlorides and subchlorides; the latter of which though insoluble in water is readily soluble in hot brine. From this solution metallic iron throws down the copper in a metallic state, regenerating the protochloride of iron, which is then ready for another charge of oxidized ore. In order to prevent a loss of chloriue, which would take place from the production of some basic iron salts during the reaction, a small amount of sulphurous acid fumes from the roast furnace is made to pass through the regenerated bath. The precipitated copper is next washed, and is then ready to be emelted into ingot. The manipulations in this process are substantially similar to those employed in the Monnier process, already described. The solutions are to be kept hot, which requires considerable fuel. The bath of protochloride of iron and salt has a constant tendency to become too dilute, and must be concentrated by evaporation, which may be done cheaply by blowing through it a blast of hot sulphurous fumes from the roast furnace. With proper precautions the bath maintains its solvent powers indefinitely. No fuel is required for the production of cement copper except to roast the ores and maintain a temperature of about 150° in the bath while the reactions are in progress. A leading advantage that this process has over all others where iron is employed for precipitation, is that owing to the large amount of dichloride of copper present, two equivalents of copper are precipitated for each equivalent of iron consumed, while all other processes require about two tons of iron for each ton of copper secured. This, and the fact that there is no waste of chemicals, except a little salt to supply unavoidable losses, and that all the products are evolved in a state of purity, mark the Hunt & Douglass as pre-eminently the iron process of the future. The cement copper being precipitated from neutral solutions holding no persalts of iron is unusually pure.

The extraction of silver and gold from copper ores by this process is thoroughly accomplished. The bath of protochloride of iron and common salt effects the chlorination and solution of any silver and gold compound present in the ore. The dissolved silver may, before the copper is precipitated, be deposited in the usual way by metallic copper. Any defects in the roasting of the copper and silver are supplied by the bath, as it will seize upon any sulphates and sulphides remaining and convert them into chlorides, while all the silver and gold passes into the solution with the copper, from the well known action of protochloride of copper. The gold remaining may be removed in the way usually practiced in chlorination. Nickle gradually accumulates in the bath, and when in sufficient quantity may be extracted by peroxidizing and precipitating the iron. This may be effected by forcing a current of air through the liquid, and mingling with the solution pulverized carbonate of lime. The various dissolvings and precipitations require about eight hours, and the process generally is so rapid that the same bath may be used once every twenty-four hours. From the large amount of oxide of iron obtained during the operation, it might be profitable to erect a small shaft furnace to reduce the oxide to metallic iron. Thus there would be little occasion to purchase fresh supplies of iron for the precipitation of copper.

That the Hunt & Douglass will extract copper and silver to a very close percentage is apparent. In a comparison between it and the Monnier process to determine which would be preferable for a certain ore, the result would depend altogether on the character of the ore itself. Probably a comparatively poor ore, not very complex, could be more satisfactorily worked by the Monnier process; while for richer ores, containing a considerable amount of base metals, it might be that the Hunt & Douglass would give the best results. Both processes, however, are superior, and in extraction by either method one could not be far from the better. It is not probable that with our present knowledge of chemistry any better than, or as practical processes as, these can be discovered, as they are each founded on the simplest chemical reactions. It is not denied that among those skilled in working copper ores by fusion there is a considerable prejudice against wet processes. This arises from a want of proper scientific education, and thorough study of the subject. There is also a strong disinclination in many minds to learn anything new.

Throughout the State of California there are many rich mines of copper-silver ores. If these are to remain unworked till some fusion process can be economically applied they will lie unworked for a century to come. But by the use of wet processes these mines can be made productive at once, and would prove to be among the best paying investments on the coast.

A copper process has been patented by M. L. du Matay, of Paris; but, as no details have come to hand, its description is omitted. It appears, however, to be complicated and delicate, and on this ground may not be practically useful.

Treatment of Silver-Copper Ores.

Having in the foregoing treated of the beneficiation of copper-silver ores, attention is now invited to the economical treatment of complex silver-copper ores, or those containing small amounts of copper and other base metals chemically combined with the silver. The treatment of such ores, for well known reasons, is not practicable and economical by the amalgamation process.

The reduction of complex silver-copper ores must of necessity be always preceded by a proper calcination or roasting. They generally require chloridizing, whereby the silver and other compounds are converted into soluble chlorides. This was first introduced by Augustin, an officer of the Mansfield copper mining company. He roasted the ores with common salt, and dissolved the chloride of silver in a hot and concentrated solution of common salt. From this solution the silver was precipitated by metallic copper, which in its turn was thrown down by metallic iron. This process was found to be less applicable to the direct treatment of ores than to such products as speisse and matte, because raw ores frequently contain substances which interfere with complete chloridization as performed by Augustin, the operations are very delicate, and other products beside silver are dissolved by the brine, notably chloride of copper and lead. All other processes, however, have now been superceded by what is designated as the Salving process, which is, at present, without a rival in its particular field.

Shall California be Represented?

If California is to be properly represented at the Centennial Exposition, it is time to begin to talk business. This putting off things until the eleventh hour, may do in local fairs and exhibitions, but it will not do in this case and is altogether inexcusable. Ample notice has been given to allow the most elaborate preparation. But there is always too much beating about the bush in these matters, and everybody waits for somebody else to take hold and do something; the result is a damaging delay, at the end of which something in the makeshift line is done which is divested of all responsibility, and which is not likely to receive the consideration allowance to which it is supposed to be entitled.

There are at present reasons for apprehending that our exposition at the Centenniel will parteke somewhat of this character. When the eleventh hour comes—and it is not far distant—the excitement attending it will no doubt stimulate some one to take hold of certain points and make an unsatisfactory exhibit of the resources of California. It would be better for us to not be represented there at all than to be misrepresented. The people of California ought to take this matter in hand, and not leave it with irresponsible adventurers, who assume the position of representative men in various matters; and though their acts are not endored, they are allowed to pass because they are allowed to remain uncensured; and are too generally tolerated on the generous supposition that they are honest enthusiasts.

This matter, of properly representing the condition and resources of California, should be divided and subdivided into districts and neighborhoods. Here is where we should give special consideration to the great diversity of the country.

The products and peculiar characteristics of any locality will not be appreciated or receive due consideration in this matter except by the residents thereof. We hope the *true* representatives of these localities will at once make a selection of what will best represent them at Philadelphia, and take hold of the matter in a business-like way; availing themselves, to the fullest extent, of the services of the appointed officials and of all the rights and privilegee which the Exposition affords.

After making a judicious selection of exhibits and exhibitors, the plans of operation should not be allowed to lag or be diverted from their proper course, from want of public interest and good advice, or cramped and crippled for want of pecuniary support. It will take some money; and this burden should not be shouldered on a few who are liberal in these matters; and when "the needful" is provided, it should not be left at the disposal of those who might be tempted to use the Exposition for their own gain or glory.

This matter of California's representation at the Centennial Exposition is really an important one. If we have within our State objects that, according to the somewhat hackneyed term, "must be seen to be appreciated," let us, as far possible, place them at the great Philadelphia Exposition, where they may be seen by all the world, as it were, and they will not fail to be appreciated.

The "Devil Fish."

Those of our readers whose school daye date back fifty or eixty years ago, when school etlasce showed many an "unexplored region," and when natnral history was made np largely of the statements and wouderfnl talee of travelere and eea captaina, will donbtlesa recall the ancient lookiag pictnres in the echool books of thoee days, ench ae a ship being engulfed in the Norwsy Maelstrom, aud of the still more dreadful accounts of the hnge kraken, which wae portrayed with its long arms spread acroee the deoks and twined around the maste of an old time Dntch ehip that was juet being drawn beneath the eea hy tho power of tbis hideous moneter of the ocean.

As time wore on, and the wonderful tales of nnlearned travelers began to be qaestioned in the light of oloser and more intelligent obeorvere, the pnblic came to place bnt little credence in the etorica of eea captaine and eailors with regard to the existence of this kraken. In time, however, pnblic curiosity wae onoe more aroneed by the pnblioation, in Victor Hugo'e "Toilere of the Sea," wherein he placed hie hero in a dismel pool on a rocky ieland, where he wae eiezed by a monster eimilar to the kraken, hut called by our author a "devil fish," and from whose elimy embreces and cepacioua atomach he wae eaved only as by a miracle. Notwithstanding thie revival of an old story in a new and more reasonable dress, it ie prohable that at the time the French novelist gave hie book to the world, not one in a thousand of his reeders regarded hie devil fish in any other light than a creatnre of the aathor's fency. But as time wore on, and the sea hecame more aad more a common highway, so many well eub-stantiated facte ae to the verity of Hugo's eea monster were brought to pnblic notice, that a belief in its existence eoon became aa mnch a common place matter ae a recognition of any of the most ordinary facts in natural history.

The devil fieh ia classed by naturalieta as an *octopod*, from the nnmber of ite legs, or, more properly, tentacles, with which it reachea out and eiezee its prey. It eeema to he a habitat of nearly all portious of the ocean, aud occnrs iu aize from a weight of a few pounds to several thonsand. Small specimena are very often taken by San Fraacisco fishermen, near the Golden Gate, and bronght to the city aa cnrioa-ities. There have heen two on exhibition at the fish market, corner of Leideedorff and Clay etreets, in thia city, daring the paat week. They each meaenred about twelve feet from end to end of their arma—that ia, each arm was abont aix feet in length. The epecimene taken in thia vicinity, althongh they made a great epread, are of emall weight, and probably of little etrength. Age, no donht, increaeee tbe compaee of the body and tentaclea, aa well ae the etrength of the same, more rapidly than it doee the epread or length of the arme. With three or fonr only of the long slimy arme of veu the small epecimens eo often exhibited in this city, twined around one'a body or limba, the etrongest ewimmer would he likely to give np in despair. Small apecimens of the octopus have lately heea shown alive at the Brighton aqnariam, near London, England, where their habits bave heen carefnlly watched and studied. A live devil fiah would form qaite an attractive featnre at Woodward's, and we wonder our fish-ermen here never had the good lnck or thought-fulneaa to secure one alive for such exhihition. Mr. Woodward would, no doubt, pay amply for such a prize.

The engraving given herewith ie a very fair representation of this curioue fish, with its arme epread out open as it appeara upon the aand at the bottom of the water in an aquarium. Ite aubstance is very soft and pliable, like the jelly-like snbetsnce which is so often picked up aloug the aea shore, almoet anywhere, and eepecially on tbe beach juat helow the Cliff Houee, near this city.

That theee monetere eometimee reach huge proportione, there can be little doubt in the light of recent and accumulated evidence. It is but lately that a well authentioated etory came from Japan, that a company of native fishermen had killed an octopue, while the monster wae attempting to overtura their boat. In eeveral recent numbers of the *American Naturalist*, we find detailed deecriptions of octopi, which, ae given on anch high authority, cannot be regarded as otherwise than truthful.

One wae lately found on the beach of one of the Bahama ielands, which weighed some 250 ponnde, and yet its tentacles were not much longer than those upon the specimena ao often seen in thie city, weighing hut fifteen or twenty pounde.

Captain Campbell, a Glonceeter fisherman, reporta that on the 20th of October, 1871, he diecovered a mass of jelly, which proved to he the dead carcass of an ootopua floating upon the sea, near hia veeael; a hoat was lowered aud provided with hooka by which the mass was towed alongside hia schooner, and an attempt waa made to haul it on board with block aud tackle, but it waa too far gone in decomposition to admit of being removed from the water. Carefnl meaeurements found the hody to be four feet eight inchee in circumference, and the arma, which were about nine feet in length, were nearly two feet aronnd at their junction to the hody. The entire weight of the monster was estimated at 2,000 ponnds, with bnlk snfficient to fill eight or ten barrola.

During the past week or two, onr English exchanges have been alluding to a singalar and terrific encounter with one of these monsters by divers, while engaged in their work in the depths of the sea. It seems that in Mnrch last the French packet, *La Normandie*, wsa wrecked npon a line of rocks knowu as the *Roucas*, fringing the eonthern shore of the island of St. Honorat, on the French coast. For two months past, divers hava heen et work bringing np the machinory and part of the hall of the vessel. A short time since, two men went down as nsual to carry on their work, when one of them immediately felt hia legs caaght as if in a vice, and perceived hefore him the hody of an enormons octopne. Eadeavoring to free himself, he laid on vigorously with a crowbar, hut the iron slipped off tho ekiu of the moneter without making any impression; his comrade now came to his aseietance, but wae immedietely aeized hy the spare limbs of the octopus, and found a leg aud one arm firmly enlaced. Fortunately, hie other arm wae free, and on his ringing the

THE DEVIL FISH.

alarm bell the divere descendod in force, but could only deliver their comradee by cutting off the tentaclee one by one. The pictoriala, of course, could not let auch an opportunity pass, and have accordingly ehown np thie eubterranean combat in euch a manaer ae might he nsturally be expected from the fertile imagination of the engraver'a art.

Combined Mop.

Rubard C. May, of Sacramento, ie the inventor of a combined mop and ecrubbing brush, whioh ia exbibited at the Mechanice' Fair.

MAY'S COMBINED MOP.

The engraving ehowe plainly the character of the device. It consists of a ecrubbing bruah and mop, arranged on a single handle in an adjnst able manner, so that either can be nsed ae deaired. With it the user can stand up and do her own scrnbbing, moppiag aad wringing, without atopping to pick up a brueh, and there ia a cloth on the handle to dry the floor with.

The floor can be scrubbed cleaner, ae both hands can be used on the handle, giving more weight on the brush. Tho operator also has more control over the mop and it can be placed under the hrush to dry the floor thoroughly.

The cloth can he wrnng out easily without wetting the handa or having the water rnn down the arms. And if one is called away from her ecrubbing she can go with dry hands. Fig. 1, shows the procese employed for wringiag out the mop, and Fig. 2 ehowa the manner of drying with the cloth.

The New York *Herald* speaks in glowing terms of the recuperative energy of our people, aa evidenced in the proposed re-eetablishment of the Bank of California.

Cars are running over the Brooklyn and Fruit Vale railroad.

Resources of Yesso, Japan.

A few monthe sinca we promieed onr readers eome extracts from the very valaahle Reports of General Horace Capron of hie Commiasiou nuder the Government of Japau, for the agricultural improvement of the Island of Yeeso. We hereby give our first instaallment, beginning with the opening chapter, which oontaine an abstract of the plan and object of tho aiseion, with a geueral view of the reeources and present condition of the island of Yoeeo, which is probably destined to become to Japan what California ie to the United Stetee:

In a preliminary letter to General Capron, dated at Salt Lake City, Utah, U. S. A., Augnst 15th, 1871, Professor Blake gives a general account of the natnre aud extent of hie explorations in Yesso, and of the reeulte thereof. Together with Mr. Pumpelly, he was eugaged by the Japanese governmout, through ite Commercisl Agent at San Francisco, C. W. Brooks, Esq., to aot as mining engineer and geologist. Tbis propoeition emanated from the Cabinet of Tycoon, the island of Yesso being designated as the field of operatione. Profeaaor Blake aud Mr. Pumpelly arrived in Yokohama after a passage of ninety daya on the eailing ahip *Carrington*. Owing to uncertainty ae to the nature and acope of their proposed work, tbe Japanese government having formed no definite plane for their future operations, they remained in Yokohama three montba hefore proceeding to Yeseo. At leagth it waa definitely settled thst the aim of their investigatione ehonld he the development of the mineral resources of Yesso, esp cially of those portions helonging to the central government, as diatinguished from the domain of independent princes. Hakodate waa made their base of operations, and they were given full discretion ae to the method and extent of their work. Several Japanese atudents accompsnied them in their explorations, and in winter they gsve instruction in mining engineering and geology to classes of native sndents at Hakodate. It wae discovered that the government had made aome attempts at working mines in Yesao, and was even then conducting lead mining and eulphur industry npon a considerahle scale, efforts having also been msde to mine and manntacture iron. It was impossible, however, Profeseor Blake discovered, to ohtain sny satisfactory information ae to the mineral wealth of the island; and he determined that only actual inveatigation wonld enable him to ascertain with what minerala he had to deal, and how Japanese labor could he best utilized for their development according to the most approved modern methode. The summer monthe were spent in explorations of the mining localitiea within 125 to 150 milea of Hakodate, extending over the groster part of the country lying to the north and weet of Volcano Bay. Professor Blake made eeveral expeditione of thie character, returning each time to Hakodate and reporting progress to the gavernor. The party travelled npon horeeback, and were kindly and hoepitably treated at the varions Japaneee inns where they stopped. They enhsisted in great part npon Japanese food, beiug able to obtain good fish in almost every locality. Salmoa and other fine varieties abound in the rivere, and are canght in large nnmhers by the Ainoe. Trout aleo are pleutiful, eepecially in the npper parts of the river and in their hranches; great quantities are canght and dried, forming an important article of export. Among the many mariue prodacts ntilized by the inhabitents and made artiolee of commerce, are the coarear varieties of -eaweed. The hotter kinde are fonnd on the western coast, ae also a great many other see products, ench as hôche-de-mer, echini, haliotie and cuttle fish. Game abounde in the interior, deer horns heiug an importent article of export.

The population of Yesso is over estimated. Hakodate and Matemai are the principal cities. There are a number of Japanese trading and fishing villagee along the coest each way from Hakodate, bat ae one goes farther north the number of Ainos, or "hairy men" increasee. They penetrate the furthest receeses of the mountains in the interior, hanting and fishing, and from them is gained the beet knowledge of the interior. They pay tribute in many waye to the Japanese, aad are, apparently, very docile and gentle. Physically they are well formed, mnscular and active. Under proper guidance they wonld, nndoubtedly, he of great use as lahorers. Their habitation extends even to Sagalin and the Knril islande, and all namee of rivers, mountains, etc., north of Volcano bey are Aino. The interior of Yesso ie mountaiaons and rugged, hut covered with a fine growth of decidnone treee, the oak and ohestnnt, particularly, ahounding. A considerable quantity of hard timber is exported, and a remunerative hnsinese could, undoubtedly, he eatahliehed by the erection of eaw mills. Some of the monntain slopes, especially those of volcanic origin, are covered with a thick growth of small hamhoo, "*take*," almost inpenetrable, and a great obstacle to travel ae well ae to cultivation.

Nearly all the varietiee of the whole range of geological formstion are represented in the eoil and rocke of the island. There are a greet many imposing volcanic peaks and groups of extinct volcanoe. The neareat to Hakodate, Comangadake, ie especially interesting from the fact that it has been in violent eruption aince Commodore Perry'a visit. The traces of that ernption were freah and distinct in 1862. A village hed been awept away, and an extensive area of forest had been deetroyed hy an overflow of hot water accompanied by great volumee of snlphnrone eteam. The treee, etripped of their limha and hark, were atill atandiag in many placee, thongh half huried by a deposit of scoriæ and ashes, chiefly small fragmente of pumice. The orater of this volcano ie an extensive depreseion with almost vertical walle. It can be descended, however, and traveraed to the inner crater where fire waa (in 1862) still vieible, accompanied by jets of steam and vapors of anlphur. Another volcanic conie, Esan, risee ae a landmark at the end of the land aontheast of Volcano hay. Thie is aleo eolfateric, and hse very valuable depoeite of ealphnr. There ie a remarkahle group of eimilar conee to the northward of the bay, which yield large qnantities of aulphur of good qnslity.

Perhaps the most important alope, agriculturally, of Southern Yesso, ia that extending southward from the mountaine toward the peninsnla of Hekodate. It faces the etraits, has a southern exposnre, a rich, deep soil, and a climate which nearly corresponds to thst of Philadelphia and Baltimore. It ie, in general, free from forest growth and is well adapted to the cultivation of corn, potatoea and the cereale. The hroad bottom lands of the Toshibeta will also afford a superior soil and wide, level terraces, adapted to cultivation npon a large scale snd with modern lahor-saving appliancee. Thia great valley, however, is comparatively unknown, even to the Japanese themselvee. Indeed the whole of Yesso ie practicelly a *terra incognita* to tbe inhabitaate of Nippon. The conditione of life aad labor in the former are very differeat from those in the latter. Tbe people of the southern island are inclined to regard their neighbore of the north as a rude, illiterate and inferior race.

Agricultural Implement Manufacture.—It ie a matter of no little surprise to every reflecting person that Californiа ahonld be dependent on the Eaat to auch a great extent for her agricultural machinery. So far as we can learn, every attempt which haa been made to manufacture such machinery here hae met with reasonshle anccesa. Tbe field for such industry is large and promising, as will be seen hy the following enumeration of tbe several shipments to this port for a single year, which has been carefully compiled hy the Sacramento *Bee:* There are annually shipped to this coaat some 6,000 wagons, 2,000 buggies, 2,000 mowing machines, 500 headera, 200 threshing machinea, 2,000 grain sowing machines, 3 000 horse rakes, 2,000 harrowa, 1,000 gang plows, 3,000 single plows, aad 2,000 portable steam engiues, at an aggregate coat of $3,100,000, whioh could sa well, aud should by rights, he manufactared in thia State. There are also enough of the smaller implements to nearly double this sum.

The Lotta Fountain waa nnveiled and turned over to the city authoritiea of San Francieco, Thureday afternoon, with appropriate ceremonies.

DEWEY & CO.,

PATENT AGENTS,

Office—224 Sansome Street, San Francisco.

The Large Circulation of the Mining and Scientific Press extends throughout the mining districts of California, Nevada, Utah, Colorado, Arizona, Idaho, Montana, British Colnmbia and to other parts of North and Sonth America. Established in 1860, it has long been the leading Mining Journal of the Continent. Its varied and reliable contents giving it a character popular with both its reading and advertising patrons.

Sutter Creek, February 26th, 1875.
Messrs. Dewey & Co.—I have received my Letters Patent through yonr Aagency. nd, for your promptness, accept my thanks. Yours, S. N. Knight.

Improved Cast and Forged Steel Shoes and Dies for Quartz Mills.

[PATENTED MAY 26TH, 1874.]
Price Reduced to 16 Cents Per Pound.

SAN FRANCISCO, November 10th, 1874.

To Supts. of Quartz Mills and Mining Men generally:

We take pleasure in stating that owing to the rapid increase in our orders, our Pittsburg Manufactrors have been compelled to add largely to their works—a new gas furnace and heavier trip hammer—and are thus enabled to reduce the cost of steel and at the same time produce SHOES AND DIES superior to any yet manufactured. We have consequently reduced the price to 16 cents per pound and solicit a trial order, guaranteeing that you will find them at least 10 per cent. cheaper than the best iron. There are no STEEL SHOES AND DIES made excepting under our patent and sold at this office, or by our authorized agents, though certain Eastern manufacturers advertise STEEL SHOES AND DIES which are only cast iron hardened by the addition of a composition. They will not out-wear two sets of common iron, though called steel. They are very brittle and are not capable of being tempered, flying from under the hammer like cast iron. Our STEEL SHOES AND DIES are in use in many of the largest mills on the Pacific Coast, and all who have tried them pronounce them cheaper and far superior to iron in every respect, even at the old price of 20 cents per pound. Their advantages over iron are cheapness on first cost, increased crushing capacity, time saved in changing and in setting tappets, increased value of amalgam by absence of iron dust and chippings, and a saving of 75 per cent. in freight. It takes 50 days to fill orders from the manufactory East. Price 16 cents per pound shipped at San Francisco. Terms liberal.

Address all orders, with dimensions, to W. A. Townsend, Secretary.

FRANCIS SMITH & CO.,

MANUFACTURERS OF

Hydraulic Pipe,

AND

ARTESIAN WELL PIPE.

Having the Latest Improved Machinery, we can make it an object to

Mining & Water Companies

OR

WATER WORKS,

To Contract with us for

SHEET-IRON PIPE.

All Sizes Made and all Work Guaranteed

30 Beale Street,

JOHN THOMSON. JOHN B. PARKER.

THOMSON & PARKER,

(Formerly with David Stoddart,)

112 Beale Street, San Francisco, Cal.,

ENGINEERS and MACHINISTS,

MANUFACTURERS OF

STEAM PUMPS, STEAM ENGINES,
And all kinds of Machinery.

REPAIRING PROMPTLY ATTENDED TO.

Thursday Noon our last forme go to press. Communications should be received a week in advance and advertisements as early in the week as possible.

California Industries.

There are in the Mechanics' Inetitnte Pavilion many marked proofe that our home manufactures excel articlee of a similar neture which are imported. In eome inetances the articlee made here are mnch enperior to those we receive from abroed. It should be a jnet ceuse of pride to California that euch is the case, in view of the fact that labor aud fnel is high here and the market comparatively limited. We are away off on one eide of the continent by onrselves, with a ecant popnlation when we take into consideration the size of our State. We heve only half a dozen cities of any eize ae yet, and even they are emall compared with the great cities of the Eastern States.

True, we heve the trene-continental railways to connect us with older centers of commerce on one hand, and the ocean for a highway in the other direction, but we have eo mnch competition from older eetabliehed and richer factoriee that we have to etruggle hard to compete with them. In the Eest they have large factoriee which work on a single article, of which they turn ont immenee nnmbere, far cheaper than any competitors can who only make them on a smell ecale. Here we have as yet no snch thing. our fonndries do general work, ae do our carriege ehope, furnitnre factoriee, and in fact all our indnstrial institutions. None of them make a epecialty of one particular article or class of articlee and stick to thet alone.

The conntry ie toô yonng for anything of thie eort yet and it will probably he several yeare before anything of the kind referred to will be inangurated in California. Still, with all the drawhacke, we now meke a very good ehowing in the way of indnetrial operatione. We can in a walk throngh the Fair enumerate the following home manufactnree now in operation, many of them on a large ecale:

Several carriege factories, a nnmber of wire factories, wire rope, wagons, glne, pnmps, pottery and terra cotta ware, glaesware, eaws, chocolate, yeast powder, carpete, engines, rnetic frniture, pianos, mnsicel instrnmente, agricultural implemente, pictnre frames, furniture, silk, ink, plowe, harrowe, belle, braes goode, tiles, cigare, tobacco, cigarettes, watchee, plumbers' goods, hilliard tahlee, car, wagon and carriage springs, etoves, mathematical and optical instrnmente, baby carriagee, clothiog ealt, mettresses, ramie, woolen goods, candles. rope, cutlery, peints, safee, eilverware, machinists' tools, edge toole, eoap, wood work, etc. In many of the ahove instancee there are eeverel factories in the same bneiness, and some on quite an exteneive scale.

Mysterious Clocks.

A cnrioue clock ie ehown at the Mechanice' Fair, which attracte conaiderable attention, and excitee eome cnriosity. It is a disk of glase with the honre marked thereon and heavy plated hande to mark them. There are apparently no works to operate it, nor any wiree or mechanism connected with the hande to make them move. These clocks are not driven by electricity, but are wonnd np in the hands, which are looeely attached to a pivot in the center of the glase plete carrying the figuree of the honre.

An exemination of a clock of the same kind, showed that the arrow-pointed long end of the hand was connterhalanced by a disk-shaped hox at the other ehort end; in thie box were worke like those of a watch, which revolved a connterpoiee around itself (but aleo hidden in the hox) once in twelve honre, and in this way caused the center of gravity of the hand to lift, eo that it took enccecsively different positions; tbns, when the counterpoise wee at the extreme end, the arrow-pointed end of the band would indicate 12 o'clock; when the connterpoise moved to the right, it wonld succesively point to 1, 2, 3, 4, and 5, nntil the connterpoise was as near as possible to the axis of the clock dial, when the center of gravity of the hand ae a whole would be thrown to the other side of the axie, and the hand would indicate 6 o'clock. When a minnte hand is on the clock of conrse the watch work inside causes the counterpoise to work a revolution every hour; it movee independently of the hour hand, both being loosely elipped over the pivot in the center of the dial. The clock is so nicely gotten up that it appeare to move without mechanism. Aluminnm, one of the lightest of metals, ie need for parte which ought to be light, aud the nearly nine times heavier platinnm for the connterpoiee, which, of course, ought to be heavy and at the same time occupy as little room as possible. The clock on exhibition at the Pavilion was made by A. Eisenberg, at Andrews' Diamond Palace.

Capital pnnishment is not "played out" in Arkansas. Six men were hanged at Fort Smith yesterday.

An accurate meaeurement of the American Fall, at Niagara, has placed the hight at 158 feet.

Herbert E. Hall hae been appointed U. S. Ganger of the First California District.

A Conetitutional Convention ie hsing held in Alabama.

The Mining Share Market.

The "little" Boerd of Brokere opened their doore on Monday last, but the San Francieco and Pacific Exchange have not as yet signified their intended day of reenming bnsinese. It is reported on apparently good anthority that the Bank of California will reopen its doore for the transaction of hneiness under the control of the Syndicate on the 16th inet. If this ie the case the Gold Bank and Trnet Company will probably reenme at the eame time and there will be a general unlocking of money bags end a lively distribution of the circulating medium. A large snm, varionely estimated from $5,000,000 to $15,000,000, ie said to have been recently eent here from the Eaet to be in vested in the stock merket. How much of truth there is in tbese reporte we cannot vouch, but it is certain that Eastern capitalists feel a growing interest in the mining intereets of the Pacific coaet, and eome of the most far eeeing ones are taking advantage of the present low etate of the market to make enhstantial in vestments.

The Consolidated Virginia has declared its uenal monthly dividend of $10 per share, payable after the 7th inst.

The aseesements come thick and fast ahout thece times. All hands seem to take advantage of the ecercity of money to get what they can out of hard np stockholdere. Since our last, assesments have been made in the following companies: Imperial, Knickerhocker, Caledonia, Golden Chariot, Mint, Crown Point, Victor, West Point, Little Panoche, Morse & Evans, Star King, Phœnix, Empire, Oakland, Constitution, Leo, Panther, and Tiger. The reporte from the Comstock continnes most enconraging. A good report comes from the Idaho mines also, as will be seen by conenlting our snmmary.

Smart thieves they have np the San Joaquin valley. A perty of them carried off the coroer etone of a new conrt house the other day, and stole the contente.

Mr. George N. Cornell of Nepa is einking an artesian well on his premisee and is now down 250 feet without water.

Patents & Inventions.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

From Official Reports for the Mining and Scientific Press, Dewey & Co., Publishers and U. S. and Foreign Patent Agents.]

By Spscial Dispatch, Datsd Washington, D. C., Sept. 7th, 1875.

For Week Ending August 24th, 1875.*

Horse Shoeing Tool.—Carls R. Donner, S. F., Cal.

Device for Propelling Care.—Wm. Eppelsheimer, S. F., Cal.

Means for Tuening Cabe on Short Curves.—Wm. Eppelsheimer, S. F., Cel.

Fluxing Composition.—Alfred Paraf, S. F., Cal.

Stamp Mill Feeder.—John Welker, Sonoma, Cal.

Distributing Quicksilver in Quartz Mills, Martin P. Boss, Virginia City, Nev.

Watch Case Spring.—Ansel S. Buckelew, Colnsa, Cal.

Device for Operating Throttle Valves.—Philip Hinkle, S. F., Cal.

Air and Water Heater.—Wm. H. Richardson, S. F., Cal.

Lift Pump Valve.—Fred A. Ruhl, Stockton, Cal.

Wagon Wheel.—John Steiner, Mendon, Cal.

Ore Washer.—Lorenzo D. Stephens, Gold Run Cel.

TRADE MARK.

For Tea.—Kwong on Cheong, S. F., Cal.

*The patents are not ready for delivery by the Patent Office nntil eome 14 days after the date of issue.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors tranected with perfect security and in the shortest possible time.

Dr. Pierce's Componnd Extract of Smartweed, or Water Pepper, ie not recommended as a cure-all. It ehould not be classed with the patent nostrume of the day. No patent has been obtained or asked for npon it. It ie not a eecret medicine, the chief ingredient being made known in the name chosen to designate it. But it ie claimed to he a *superior* Extract, made in a scientific menner, from fresh plante and roots, by a cold process; heat, which is nesed in making all otLer Extracts of Smart-Weed, being objectionable, ae it destroye most of the medical virtues that reside in the plant, as stated in the American Diepensatory and hy other meet excellent anthorities. In the modeet looking little weed, fonnd growing by the roaeside, is found in a more efficacious remedy, when combined with Jamaica Ginger and other modifying agents, for Diarr œa, Dysentery, Summer Complaint, Paiu and Colic, than has heretofore been known to the medical profeeeion. Dr. Pierce's Extract is sold hy druggiets.—Com.

MINING SHAREHOLDERS' DIRECTORY.

Compiled every Thursday from Advertisements in the Mining and Scientific Press and othsr S. F. Journals.]

ASSESSMENTS.—STOCKS ON THE LIST OF THE BOARDS.

DEWEY & CO.,

American & Foreign Patent Agents,

The best, speediest, and surest method for you to obtain patents, file caveats, or transact any other important business with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counsellors.

We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, but with the influence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of good patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

To Obtain a Patent,

A well-constructed model is generally first needed, if the invention can well be thus illustrated. It must not exceed 12 inches in length or hight. When practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address upon it.

Send the model (by express or other reliable conveyance), plainly addressed, to "DEWEY & Co., MINING AND SCIENTIFIC PRESS OFFICE, SAN FRANCISCO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement describing the various parts and their operations.

Also send $15 currency, amount of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the documents made up, and soon sent to the inventor for signing.

As soon as signed and returned to us with the fees then due us, it will be sent straightway to the Patent Office at Washington

For designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances for design patents two photographs, with the negative, answer well instead of drawings.

For further information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS, 112 illustrated mechanical movements, and HINTS and INSTRUCTIONS regarding the RIGHTS and PRIVILEGES of inventors and patentees, which will be furnished post paid. Also a copy of NEW PATENT LAW of 1870.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, sufficient to make the experiment (unless they are of a common and well-known character), and also of the manufactured article itself, must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and what is desirable to claim.

Thanks for Prompt Attention.

STOCKTON, June 26, 1875.

Messrs. Dewey & Co., S. F.:—

I have received the patent for my invention in wagon brakes, which you prosecuted for me; patented May 11, 1875—No. 163,046. Thanks to you for your prompt attention to the case; you will hereafter be my attorneys in such cases. I recommend all inventors on the Pacific coast to give you a call, which I think they will never have any cause to regret. Very truly yours,

GEO. G. BUCKLAND,
Stockton, Cal.

PACIFIC RURAL PRESS,

A first-class 16-page Agricultural Home Journal, filled with fresh, valuable and interesting reading. Every farmer and ruralist should take it. It is immensely popular. Subscription, $4 a year.

DEWEY & CO., Publishers,

No. 224 Sansome street, SAN FRANCISCO.

THOUGHTLESSNESS.—Persons sometimes return their paper, marked "stop this paper." Their name being pasted on the sheet they think that is all we need to be able to erase their names off. Now that is thoughtlessness. Your P. O. address is needed as much as your name. We have thousands of names arranged only according to locality. Our mailing clerk does not know where everybody lives.

UNITED STATES

Mineral Land Laws, Revised Statutes,

And Instructions and Forms Under the Same.

We have just issued a pamphlet containing the general mineral land laws of the United States, with instructions of the Commissioner of the Land Office The contents of this pamphlet comprise all of the Government laws with relation to mineral lands of interest to the mining community, as follows: Mining Statute of May 10th, 1872, with Instructions by the Commissioner of the Land Office; Mining Statute of July 26th, 1866; Mining Statute of July 9th, 1870 Forms required under Mining Act of May 10th, 1872, as follows: Notice of Location; Request for Survey; Application for Patent; Proof of Posting Notice and Diagram of the Claim; Proof that Plat and Notice remained Posted on Claim during Time of Publication; Register's Certificate of Posting Notice for Sixty Days; Agreement of Publisher; Proof of Publication; Affidavit of $500 Improvements; Statement and Charge of Fees; Proof of Ownership and Possession in Case of Loss or absence of Mining Records; Affidavit of Citizenship; Certificate that no Suit is Pending; Power of Attorney; Protest and Adverse Claim; Non-Mineral Affidavit; Proof that no Known Veins Exist in a Placer Claim, etc. There is also given the U. S. Coal Land Law and Regulations thereunder. The work comprises thirty pages, and will be sold, post-free, for 50 cents. It should be in the hands of every one having any mining interests. DEWEY & CO.,

Publishers of MINING AND SCIENTIFIC PRESS, S. F.

N. B.—We have also added to the above publication the REVISED STATUTES OF THE UNITED STATES, so far as relates to Mining Laws.

Designing and Engraving at This Office.

We are prepared to do fine Wood Engraving for illustrating Landscape Scenery, Buildings, Machinery, Works of Art, Manufactured Articles, Trade Marks, Seals, Etc. We have a first-class

Machine for Engraving

A portion of the work, which can be finished thereby more perfectly than by the eye and hand alone. Our patrons can depend upon first-class work always, and at reasonable prices. Samples can be seen at our office.

DEWEY & CO.

To Country Printers.

The large drum cylinder printing press, now used in the FAIR DAILY office, in the Mechanics' Pavilion, is offered for sale. It is nearly new, works satisfactorily, and will be sold at a bargain. Address PAINTER & Co., type founders, 513 Clay street, S. F., or the publishers of this paper.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

CAMPO, SAN DIEGO CO., CAL., July 3d, 1874.

MESSRS. DEWEY & Co.—*Gentlemen:* To-day I received the patent and other papers of my animal trap, that you so successfully worked through the patent office for me, for which please accept my best wishes. The chances are that I will have another application for you to make for me before long. I am well satisfied with your manner of doing business, and think inventors of this coast stand in their own light when they do not put their business into your hands.

I remain yours truly, A. M. GASS.

MINING AND SCIENTIFIC PRESS.—On the 3d inst. this paper, published by Dewey & Co., at 224 Sansome street, San Francisco, entered upon its thirty-first volume. It is, beyond a doubt, the best journal published on the Pacific coast for the scientist, mechanic and miner, and should receive the most liberal support. It costs much money, to say nothing of patience and endurance, to publish an ordinary paper; but the amount required of all these to publish such a paper as the PRESS can hardly be realized by amateurs or those not having had any experience in the publishing and printing business.—[Panamint News, July 14th.

THE MINING AND SCIENTIFIC PRESS, of San Francisco, entered upon its thirty-first semi-annual volume last Saturday. It is most appropriately named, and sustains well its name, containing more really useful information upon mining, scientific and kindred subjects, than any other paper on the Pacific coast. Dewey & Co., the publishers, are well known as agents for securing patents; in fact, most of the patents for inventions on this side of the continent are secured through them. The PRESS is deservedly prosperous. —[Gold Hill News.

SUBSCRIBERS are requested to examine the printed address on their papers. If mistakes occur *at any time* please report them to this office. The last figures (at the extreme right) represent the year that your subscription is paid to. Next to these the day and month is represented. For instance, your subscription being paid to July 4th, 1876, it would be represented, viz: jul 4 76; or 4jl76; or jul 4,76.

WOODWARD'S GARDENS embraces an Aquarium, Museum, Art Gallery, Conservatories, Tropical Houses, Menagerie, Seal Ponds and Skating Rink.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and Retail, by DEWEY CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY CUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his speciality.

Price $2.50 coin, or $3 currency, postage free

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Mill man, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO $5.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of the general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

Price, $5 in cloth; $5 in leather—coin.

BY OTHER AUTHORS.

The Quartz Operator's Hand-Book; by P. M. Randall. 1871. Revised and Enlarged Edition. Cloth bound, 175 pages. Price, $2.

Sulphurets: What They Are, How Concentrated, How Assayed, and How Worked; with a Chapter on the Blow-Pipe Assay of Minerals. By Wm. M. Barstow, M. D.; 1867; cloth bound, 114 pages. Printed and sold by DEWEY & Co. Price, $1; postage free. The best written work, and most complete work on the subject treated.

ANY OTHER BOOKS DESIRED will be furnished at the most reasonable rates by DEWEY & Co., Mining and Scientific Press Office, S. F.

SECOND EDITION—REVISED AND ENLARGED.

The Explorers', Miners' and Metallurgists' Companion.

Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy.

Containing 672 Pages and 83 Engravings

BY J. S. PHILLIPS, M. E.,

Of California, a Practical Operator for Thirty-four Years; Explorer, and Resident in the Pacific States and Territories for the past Eight Years.

PRICE, bound in cloth, $10.50; in leather, $12. Forwarded by mail for 50c. extra, at the MINING AND SCIENTIFIC PRESS Office, by

DEWEY & CO.

A Good Binder for $1.50.

Subscribers or this journal can obtain our Patent Elastic Newspaper File Holder and Binder for $1.50—containing gilt title of the paper on the cover. It preserves the papers completely and in such shape that they may be quickly fastened and retained in book form at the end of the volume, and the binder (which is very durable) used continuously for subsequent volumes Post paid, 25 cts. extra. It can be used for Harper's Weekly and other papers of similar size. If not entirely pleased, purchasers may return them within 30 days. Just the thing for libraries and reading rooms, and all who wish to file the PRESS. tambp

IRON CASTINGS
and MACHINERY,
OF ALL KINDS.
Fremont Street, bet. Howard and Folsom,
SAN FRANCISCO.

Empire Foundry,
Nos. 137, 139 and 141 FREMONT STREET, SAN FRANCISCO,
RICHARD SAVAGE, Proprietor.

Heavy and light Castings of every description. House Fronts, Mining and General Machinery estimated and constructed at shortest notice. On hand the celebrated Occident and French Ranges, Burial Caskets, Grates and Fenders, Road-Scrapers, Hydrants, Tuyere Irons, Ploughwork, Sash Weights, Ventilators, Dumb Bells, Gipsies, Ship Castings, SOIL PIPE of all sizes, Fittings and Cauldron Kettles in stock at Eastern rates. SHOES and DIES a specialty. Ornamental Fences in large variety. 4v30-1yr.

STEAM ENGINES AND BOILERS
Of all sizes—from 2 to 60-Horse power. Also, Quartz Mills, Mining Pumps, Hoisting Machinery, Shafting, Iron Tanks, etc. For sale at the lowest prices by
10v27tf J. HENDY, No. 32 Fremont Street.

RISDON & TOWER,
MANAGERS OF
Pacific Boiler, Sheet Iron, and WATER PIPE WORKS.
All Kinds of Boiler and Sheet Iron Pipe.
High and Low Pressure Boilers Built and Repaired.

We refer to twenty years' experience in the above business as a guarantee that all orders for work will be faithfully executed.

SAN FRANCISCO, SATURDAY, SEPTEMBER 18, 1875.

VOLUME XXX Number 12.

The San Francisco Cordage Company.

The San Francisco cordage company make a fine display of their substantial merchandise at the Mechanics' Fair. They exhibit rope and cordage of all sizes, from ordinary bale rope and manila tarred yarn to a mammoth manila cable or mining rope, which seems long enough to reach to the bottom of the deepest mine on the Comstock, and strong enough to drag even the great bonanza itself bodily from its subterranean depths.

This display, and the extensive works at which it has been produced, is eminently illustrative of what can be accomplished by good management and indomitable energy. Starting, as did this company, in the early days of California manufacturing industry, when, to the ordinary mind, the success of such enterprises was considered extremely doubtful, this undertaking has been carried steadily forward, in the face of the most powerful combinations of importers and foreign manufacturers to break it down. It has grown from a small beginning to be one of the leading and most important manufacturing enterprises on the coast. Each step in its progress has evinced the presence of a master mind, which has taken in every possibility of its surroundings and economized to the utmost at every point, whether of purchase, manufacture, transport or sale.

The importance of this industry to this city and to the people of California can hardly be overrated. The consumption of rope on this coast, in the way of cordage for shipping, for ore in the mines, on the farm, in the warehouse, etc., is immense, and much larger then is found in any other community of equal population on the globe. Had it not been for the enterprise and determined perseverance of this company, we would have been to-day at the mercy of foreign manufacturers, who would have drawn immense fortunes from our trade by reason of the heavy tariffs they could and would have imposed.

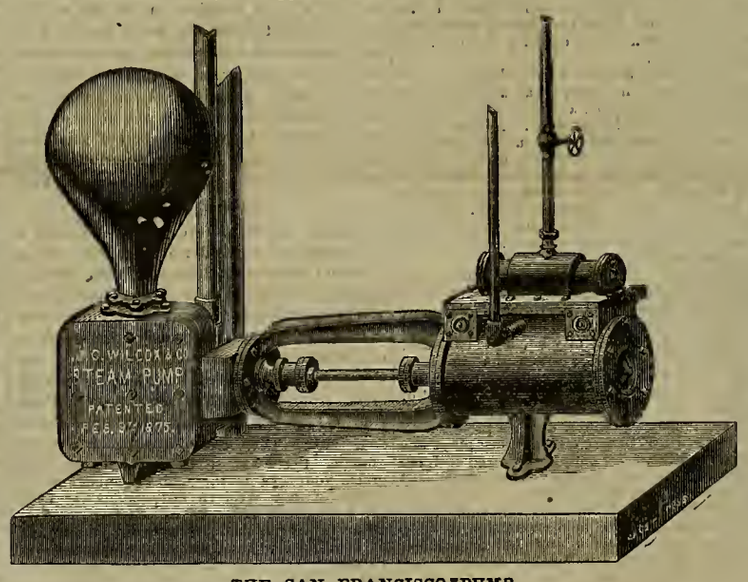
With a foresight entertained by only a few of our early business men, Messrs. Alfred M. and Hiram Tubbs, fully twenty years ago, foresaw the future of this city and State, and had sufficient confidence in the future to venture their money and business talent in what then appeared to most people the extremely venturesome experiment of establishing a cordage manufactory in San Francisco, and thus became the pioneer rope makers of the coast. They commenced in a small way, with temporary buildings, and very imperfect appliances, but the best then within their reach and means. Those temporary structures, and their imperfect machinery, has given place to greatly enlarged works of the most substantial character, and machinery equal to the best in the world.

Their factory is located on the Potrero, where they first commenced business. The main building is of brick and iron, the floor being laid on iron beams and girders, making the whole as thoroughly fire proof as possible. The rope walk is 1,800 feet long, and is situated directly upon deep water, and convenient for receiving and discharging cargo from any part of the world. The warehouse and office, at No. 611 and 613 Front street, is connected with the manufactory at the Potrero by a telegraph wire, affording all the advantages of immediate and close communication which could be derived from the same were it located in the immediate vicinity of their business headquarters. The company has recently added a large amount of new machinery of the latest and most approved patterns to their previous quite complete establishment. Their motive power is furnished by one of the most perfectly constructed engines on the coast, while their economical arrangements for producing steam are nowhere excelled. Mr. Tubbs was one of the first manufacturers on the coast who turned his attention particularly to economy in this direction. The same intelligent and progressive spirit which was manifested in that particular, at that time, has been carried all through every step and every department of this establishment from its very first inception. Take it all in all it affords a most notable example of what pluck and skill can accomplish when directed by sound judgment and an intelligent mind.

Steam Pumps.

A number of the "San Francisco steam pumps," of different sizes, are shown in the machinery department of the Mechanics' Institute, near the central stair case. This pump, a representation of which is shown on this page, is a California invention, patented by Mr. W. O. Wilcox. A large factory is now engaged in making these pumps, and, as the company have ample capital, they are about to commence their manufacture on a much more extended scale.

The principal claims for this pump are the simplicity of construction and operation and ease with which it does its work. The valves being free, and being of an extra size in diameter, give a very large suction and discharge. To get at the pump any one can take it apart and put it together again with little trouble. The cone valves, or supplemental



THE SAN FRANCISCO PUMP.

valves of the steam cylinder are made of steel or wrought iron, and are of such a nature as to prevent them wearing themselves down. The large pump valve, with no heavy cross bars on the seat to "punish" the water, will admit a solid and continuous stream, as it comes in the full size of the hole, the four small legs of the "spider" keeping the valves in place when open.

The pumps on exhibition are neatly bronzed and show great excellence in construction and operation. Only two of them are at work, one large and one of small size. The largest is eight inch steam cylinder, six inch water cylinder and sixteen inch stroke. Without going much into detail concerning the internal construction, it may be said that in a direct line above the main cylinder is the cyliuder of the usual supplementary piston. To admit steam for the purpose of driving this pieton, supplemental valves are used, which work in chambers at one side of the main valve chambers. These valvee are cylindrical conical in shape and rotate slightly upon their axes, so as to connect the steam and exhaust passages alternately, and by their shape and small amount of motion they can be run at a very high rate of speed with no wear of the parts. By running they fit themselves in seat, from their peculiar shape.

These pumps are made in a very strong and durable manner, and are inteuded specially for the needs of this coast where heavy pumping is done. No pains is spared in their construction to make them as efficient as possible, and the simplicity of their working parts makes it impossible for them to get out of order. The manufacturers claim unequaled simplicity, ability to perform the greatest amount of work with the least amount of power and strength of parts. The pump is really a good one, and well worth the examination of all interested in such matters. The manufacturers refer with confidence to those who have used their pumps, as to their general efficiency.

The San Francisco steam pump works are successors to David Stoddard, and they now occupy the three story building formerly used by him. The proprietors are B. F. Baker and W. C. Wilcox. They make a specialty of the "San Francisco steam pumps," but are prepared to do all kinds of machine work, either building or repairing. Mr. Wilcox thoroughly understands all the details of the different pattern pumps in the market; and the firm intends making a specialty of repairing those out of order. They have a good shop and first-class tools—most of them of either Seller or Putnam make. They have lathes, planers, drills and all tools adapted to building machinery. They have also a very large stock of patterns, to which they are continually adding, the upper story of the building being devoted to the pattern shop. They also own all the patterns of the Cameron or Stoddard pumps that were owned by David Stoddard. Among the tools is a large one for cutting threads on all sizes of pipes. They have abundant capitel to undertake contracts of any magnitude, and are ready to do so. In the matter of pumping particularly, they will carry out any desired plans for water works or similar enterprises on a large scale.

A company of capitalists, headed by Alvinza Hayward, have now a corps of engineers, reconnoitering a route from Susanville through Big Meadows, to Chico. A reconnoisance of the Feather river route via Oroville, is also contemplated. The Butte *Record* proposes that Chico move immediately in the matter of the road to Colusa, and thinks that of itself would be inducement enough for Mr. Hayward to join the roads with them at Chico.

The Butte *Record* says: Mr. Hardin Bale, who has been in Chico for the past ten days endeavoring to make arrangements to locate his woolen mill here, left on Monday last for Santa Rosa. Mr. Bale submitted the following proposition to our merchants. That he would furnish $15,000 worth of new and improved machinery, they to furnish lot and building. We don't know whether the propoaition will be accepted or not.

The Santa Cruz *Sentinel* says that the beet sugar factory has commenced operations, having been thoroughly overhauled and repaired during vacation. About fifty tons of beets are run through daily, and seventy men are employed in the works.

A "Chunk of Coal."

It is customary for coal dealers to place beside the door of their offices one or two of the largest size pieces of coal which they can procure from the mines which they represent; with the same intent and purposes that dry goods merchants display their "prints" and other goods beside *their* doors, and thereby tempt extravagant dames to enter therein and spread lots of—not money, but talk. But there is one coal dealer in this city who has a chunk of coal at the side of his office door, which he is not under the necessity of "taking in" at night, as there is no danger whatever of fuel-thieves running off with it. To move this piece of coal would require one of San Francisco's best dray teams, and these never run.

We had heard somewhat about this big black diemond, and were induced to make a special trip to the office of Mr. Anderson, near the foot of Market street, to obtain a view of it. We found it just where our enthusiastic guide had left a few days previous to our visit, by the side of Mr. Anderson's office door. It would take but six or eight of such blocks to make an office of themselves. It is five feet high, five and a half feet long, and two feet eight inches thick. Its weight is 6,000 pounds. It stands on edge; not on the "ragged edge," for it is nicely trimmed by the square, and looks as though it were but a chip of the old block.

It is Coos Bay coal, from the Newport mine, recently opened by Flanagan & Mann. There are no veins of slate or slag discernable in any part of it; the enormous block presenting a remarkably bright, marketable appearance.

On the whole we think Mr. Anderson's block of coal a pretty good one, "considering," for it must be borne in mind thet our coal "don't amount to much" for the reason that the veins are so very small.

The California Pitcher Plant.

In the Horticultural Department at the Pavilion is a California carnivorous pitcher plant (*Darlingtonia Californica*). The specimen referred to was brought to this city a short time since from Mount Shasta, by Mr. Henry Edwards, Vice President of the California Academy of Sciences, and is by him exhibited. The plant is somewhat of a curiosity, even to persons not interested in botanicel matters, from its peculiar habits. It is sometimes known as the "Fly Trap Plant."

It is a native of this State, and was first discovered at the foot of Mount Shasta, where the present specimen came from. It takes its popular name from its pitcher-shaped leaves, which are of a bright, mottled green color. The curious, wattle-like appendages, which drop from its leaves, are bright red, shaded with green. The flowers, which appear in early spring, are about two inches in diameter, and of a pale, purple color.

The *Darlingtonia* is a most singular and beautiful plant, and is a great study to botanists, from its inflated petiole, vaulted and armed alternately with hairs pointing downwards—the upper, hooded part of the petiole, a leaf stalk, secreting a saccharine substance, and the lower portion filled with water—the whole with "intent to deceive;" being a perfect fly trap.

Mr. Edwards stated at the Academy, the other evening, that in the specimen exhibited he had found thirty-eight flies, and several grasshoppers and dragon flies. The specimen shown at the Fair is well worth examining.

The bids for the construction of the tunnel near San Rafael, on the Sonoma and Marin railroad, have been given over to the chief engineer for decision.

They are talking of building a foundry and a factory in Fulton.

CORRESPONDENCE.

Hydraulic Gold Mining.

[No. 4.—Written for the MINING AND SCIENTIFIC PRESS, By C. J. BROWN.]

As the red stratum of gravel was being worked out rapidly by the numerous companies who own this mining section in claims of from five to twenty acres each, the Dutch Flat water company, witnessed the market for its water, grow year after year, more and more limited, and knew that unless some effective steps were taken at once to open the mines upon the lowest level, its property would soon greatly depreciate in value and its water run to waste.

Few, if any, of the mining companies could command capital to properly develop the ground they claimed, and few, if any, of their claims were extensive enough to justify the necessary outlay.

The water company was loth to enter upon a work which would require years to complete, at a probable outlay of a quarter of a million of dollars, for the joint benefit of itself and mine owners, nor did it feel able and willing to purchase the different mines at ruling prices and enter largely upon the business of mining instead of selling water for mining purposes; consequently, being offered, a fair compensation for its property, it sold out to the Cedar Creek company.

Col. Ludlum took the management of the business as the superintendent of the latter company. He came here a stranger among strangers, to conduct an extensive business in a—to him—entirely new locality, well recommended for strict integrity, probity and honor, and he has maintained the reputation he brought, untarnished. I am not intimately acquainted with him, his thoughts and his purposes, but a strict sense of duty compels one to accord this mede of praise.

A few weeks experience sufficed to teach him clearly the true condition of affairs, the future prospects of the Cedar Creek company, and the herculean task imposed upon him.

He saw bankruptcy staring the company in the face, and the event of a signal failure but a few months in the future, unless *mining* instead of water merchandising was made its principal object.

From all the evidences to be obtained—too numerous to specify here—he thoroughly posted himself as to the most probable location of the deepest—consequently the richest—bed of the Dutch Flat channel, and for the company purchased the claims situated along and on the same, viz: the Blue Cut, Potosi, Why-Not, Badger, Baker, Wisconsin, and half the Oak & Cedar.

In the purchase of these claims, Col. Ludlum exhibited excellent judgment because they undoubtedly cover the bed of the channel, and are situated in a direct line along the same, between the Yankee and the Deep Shaft, which two latter are the only claims (if we except a quarter interest in the Iowa, which bounds the Deep Shaft on the northeast) located upon it that the company took by its original purchase, and it now lacks only the Ohio, Rough and Ready, and the Michigan to complete its line of possession and these are destined eventually to its ownership; in truth, I have been informed that they were already bonded to the company This company has also purchased Union No. 2, which adjoins the Yankee on the west, and and covers the western rim of the outlet, thus acquiring possession of the the entire width of the mouth of the channel.

It also took by its original purchase of the Enterprise, one-fourth of the Grey Eagle, and a small share of the Boston; which, together with the Red Bank and Self Rising, subsequently purchased, are located off from the channel bed, upon the western side of the gravel deposits and are all "high-wash," and instead of containing a deep deposit of the rich, blue stratum of gravel, the trap slide takes its place, and rests close to and upon the bed rock.

The Deep Shaft claim covers the confluence of the old Pliocene rivers, before described, and is of great value to the company, both on account of its position and the gold it contains. Mr. Ludlum struck very rich prospects in this claim about two years ago, by sinking a shaft and drifting.

To the south of the Deep Shaft the Dutch Flat canon crosses the channel of the South Blue. This canon, has for years been claimed and flumed. The company have purchased all that portion of it lying across this channel; and to the south side of the canon it owns the Flying Fish, Waukegan, Jehoshaphat and Carr claims, of which, only the latter embraces the central channel, the balance are situated to the east and are "high-wash," resting upon high, sloping bed rock, clay and trap slide. The foregoing claims constitute all of the mining ground owned by the company in one compact continuous tract in this immediate vicinity and embrace an area of 229 acres.

The central or deep channel of the South Blue runs to the west of the Wankegan, through the Summerset claim, owned by J. Staples & Bros, who once bonded it to the company for about $14,000; but the company officials, governed by some motive best known to themselves, failed to perfect the purchase at that price. If it can be bought by the company at any reasonable figure it should not fail to take it, though it has no immediate use for the same, nor will it have for some years hence; but the present owners are scalping off all the top stratum of dirt and gravel, which, aside from the gold it contains, would be of incalculable value to the company in washing away the heavy bottom gravel through the long line of tunnel which has been projected by Mr. Ludlum for the complete development of its property.

I cannot pass this opportunity to enter my disapproval of the policy pursued by the company heretofore in washing away the top stratum of dirt and gravel from some of their claims; by so doing, it may obtain a good price for its water, when otherwise it would be allowed to run to waste; but it is a mistaken policy, and should be discontinued. The gold will still be in toe bank where the dirt is most needed, and this dirt and light gravel, in places where it still remains intact, is of more value to the company in working off the bottom stratum, than all the gold it contains, and once washed away it can never be replaced. If there is no market for the water, let it waste; each succeeding season will replenish the ditches with a fresh supply.

The Dutch Flat canon, after cutting a channel many feet below the outlet of the old channel at Thompson's hill, leaps over a perpendicular precipice of one hundred feet or more, just to the west of the Yankee, and debouches into Bear river. Below the head and a few yards to the north of this precipice, Col. Ludlum commenced a tunnel 8x9 ft. in dimensions. The projected line of this tunnel is nearly 3,000 feet long, and passes along under and lengthwise of the Dutch Flat channel and the claims owned by the company. It makes two slight angles southward from a straight line, to a point under the central portion of the channel of the South Blue, where it is crossed by the Dutch Flat canon.

The head of the tunnel at this point will be sixty feet below the surface of the rock and 120 feet below the surface of the ground.

A Burleigh drilling machine, run by compressed air, was placed in position nearly two years ago, since which time 1032 feet of the main tunnel and 62 feet of branch tunnel has been run at an average expense of about $34 per linear foot.

After running about 600 feet, a branch 36 feet long was run to the right, on an angle with the main line of about 45°, at the head of which a shaft was sunk 145 feet deep. A fine flume, six feet wide was laid in the tunnel (four feet only of which has as yet been used) and extended down from its mouth some distance; a side flume was also constructed, along the side of the canon, with undercurrents, five in all, and everything fixed and arranged in the most complete order to open up the Yankee claim from the bedrock.

This was necessarily a very slow and tedious undertaking, for, though the shaft was sunk wholly in bedrock, the gravel bank was close around it, bearing large trap boulders as thickly as they could conveniently lie, and constant, watchful care had to be taken that the shaft and tunnel did not become choked.

Washing was commenced about the 1st of August, 1874, with one little giant, carrying 500 inches of water, under a pressure of 500 feet. In February last another giant was added, and the water supply increased to 1,250 inches. Afterwards another giant was placed in position; only two of them, however, are brought into use at one and the same time The central one is to be used constantly while washing, and the right and left ones alternately as the work of washing is directed upon the right or left flank. These giants are ranged in line along the front of the bank, and the two streams in use are directed to one point and made to support each other in their thundering charge upon the obstinate object of their attack. Washing for an hour or two upon any quarter of the bank uncovers a mass of boulders, which must be blasted and broken with the sledge before they can be washed through the tunnel; and now, instead of shutting the water off as formerly, the streams are diverted to another quarter while the boulders are being reduced, or removed by means of a large derrick, which, by no means, is the least useful improvement upon this claim.

By this arrangement much time is saved, labor economized and water utilized, all of which should show vastly different results from the first years labor, during which time use of water averaged not more than twenty days of twelve hours each per month; while work, during the whole year, proceeded both night and day, the effect of which is seen within the limits of a space of bedrock not over 300 feet square, into the surface of which several cuts, leading to the shaft have been excavated, in some instances to a depth of twenty-five feet or more.

Bear in mind that this bedrock, as well as the rock on the whole line of the tunnel is very hard, fine trap, some of it exceptionally hard and tough; and then, unless you have formed an intimate acquaintance with it, you can entertain no proper estimate of its true character. For instance, I have witnessed the Burleigh machine drill a hole into some varieties of it four feet in twenty minutes, and again waste three excellent drills and an hour's time in penetrating one inch in another variety. Two hundred feet of tunnel was run at an expense of from $60 to $100 per foot, from which it can readily be imagined that the undertaking is no child's play.

In this prosecution of this work, Col. Ludlum has exhibited energy, pluck and that degree of perseverance usually ascribed to his satanic majesty; and, if the Cedar Creek company aids him as it should, he will soon gain a victory eminently satisfactory to every reasonable member thereof. My opinion of the extent of such required aid will be given hereafter.

Dutch Flat, Sept. 9th, 1875.

The Geysers—Their Wonders and Lessons.

MESSRS. EDITORS:—After visiting Cloverdale on Saturday, September 4th, as there was a little time to spare before going to Sanel, and this is the most convenient point from which to visit the

World Renowned Geysers,

I determined not to lose so good an opportunity to examine this great natural curiosity.

The smallest amount of staging to reach the mountain fastness, more than 2,000 feet above the sea, where the Geysers are found, is now from Cloverdale, by a very good road and grade, some seventeen miles. A safe driver and a good rig hurry one over this distance fast enough. On the route you pass the two celebrated quicksilver mines, known as the Livermore and the Colorado mines. In several places along the road you see signs of cinnabar cropping out, and, not far from the Geysers, a valuable deposit of chrome iron has lately been discovered. You continue to go up, up, up, along the narrow, picturesque canon through which Sulphur creek, heading near the Geysers, finds its tortuous way into Russian river.

We reached Mr. Hollingsworth's comfortable hotel an hour before sunset, and had ample time in the cool of the evening to examine each point of interest. Indeed, this hour, or early in the morning, is the only comfortable time to make a close examination, for the natural heat accumulated from the warm stream, boiling springs, and hot, seething, hissing rocks, emitting their numerous columns of sulphurous, suffocating vapor, makes the atmosphere almost insupportable under the rays of the midday sun. Leaving the hotel you pass through a gate, and, taking a descending trail to the left, you soon cross a rustic bridge over

Sulphur Creek,

A narrow stream, in every respect except a dark color and slight odor of brimstone, like a thousand other unnoted streams in the mountains of California. Your pathway then leads you by a steadily ascending trail through a very narrow canon, just like tens of thousands of others among the spurs of the Sierras and our Coast ranges. The trees, bushes and woods are green around you. Not many flowers cheer your way. A few yellow composite ones and an occasional aster peep out among the undergrowth. Besides these the only flower that greets your eye is the odd, brownish purple bloom of our Western *Calycanthus*, at least three times as large as its Eastern cousin. Beautiful laurels shade our pathway, and trunks of bending live oaks sometimes obstruct our passage. Wild grapevines, of luxurious growth, festoon the trees and shrubs. Nothing yet marks the locality as peculiar, except the inky blackness of the narrow, gurgling rivulet that rushes swiftly beside our pathway, and which we cross at times by stepping from rock to rock, or on a well worn plank used as a foot bridge.

But, as we press forward, eager to unfathom the mysteries of this deep gorge, how changed, all at once, is the scene that bursts upon your vision. Suddenly, all sign of vegetation near you disappears, except at very rare intervals a coarse, hardy grass. The rising columns of sulphurous steam, the bare, scalded, glaring, smoking rocks, and hot, black water rushing from them in places, alone meet your gaze far up the steep sided ravine. You are at once deeply impressed with the truth that you have been ushered without much ceremony into

The Devil's Canon,

With its wierd, sombre, impressive sights and sounds, and at certain points and times almost stifling fumes of sulphur.

The varied colors of the solid and pulverized rocks especially attract one's notice. Here is the pure white of the epsom salts, magnesia, lime and nitre, the yellow sulphur, the red cinnabar and oxide of iron, as well as the black sediment supposed to be caused by the action of sulphur on iron deposits. You find also the greenish streaks and spots which are always more or less associated with chrome iron. In quick succession you pass Beelzebub's Laboratory, Devil's Inkstand, Mephistopheles' Punch Bowl and other hissing, bubbling springs of water, with a temperature over 200 degrees Fah. It is undoubtedly true that if you put eggs in this hottest water they will be soft boiled in three minutes, and hard boiled in between four and five minutes. What lady's tidy cooking stove can perform this duty in better style than this Devil's Tea Kettle, so called? From many fissures hot vapor issues without any accompanying flow of water. The sound emitted is exactly like that of a locomotive letting off steam at a station.

You continue to ascend this heated, repulsive ravine, the altitude increasing quite rapidly, until about a quarter of a mile from where you enter it the entire scene is changed again. Laurels, oaks and undergrowth stand thick, green and thrifty.

Within 100 feet of this boiling, steaming caldron, these were browsing quietly, perfectly oblivious to the sight near by, which to our thinking race must ever be a vivid type of a threatening future.

A little gate invites your entrance to a lovely spot, carpeted with grass, and densely embowered with laurels. A refreshing stream of cool, clear water runs through this nicely shaded dell, and its small fish dart to their mossy hiding places as we come in sight. This all forms attractive picnic grounds, fit emblems of an earthly Paradise, with its bright, fragrant flowers and green sward; and that, too, so near the brink of

The Symbolic Hades,

through which we have just cautiously picked our way. The rapid transfer and wonderful contrast makes it luxurious. Leaving this secluded and truly refreshing spot, our path ascends and turns to the right towards our place of entrance, and soon we stand upon a prominent point, commanding a fine bird's eye view of the ghastly ravine we have been inspecting. We are now several hundred feet above the hotel, and enjoy a truly picturesque view of all its strange surroundings; though by no means so grand, it reminds one, in some degree, of the view from Inspiration Point, as you approach Yosemite.

But when the wind blows the vast columns of sulphurous vapor towards you, as it rises from below, sometimes to the hight of more than 200 feet, and you get a good whiff of it, you feel about as comfortable as if a gross of matches had been lit near your nose, and you are more inclined to call it Expiration that Inspiration Point. But when the columns blow from you you fully appreciate a remarkable scene. The path leads you back to the hotel by another route over a high and into a second very deep ravine, through which Sulphur creek runs. You pass several other deposits of sulphur and fissures hot and hissing. In one of the largest of these the heat is so intense as to blacken and char sticks thrust into it. Along Sulphur creek you find other columns of the same vapor, and bath houses, in which steam or water baths are furnished. Above these the water of the creek is cool, and the growth along it rank, although the water is strongly impregnated with sulphur and salts.

One is well repaid by a visit to the Geysers, and after seeing them does not wonder at the opinion of the kind-hearted, prudent, old Irish lady, who, while picking her way carefully among the rocks and grass, prayed carefully every where she stepped, as if looking for some creeping thing. A friend remarked to her that there was no danger of snakes in that canon. "Ooh!" said she, with a shudder, "it all looks and smills as if it might be the home of the

Ould Serpent Himsilf!"

We can echo her sentiment too, when she had lingered too long among the sulphur fumes, and was almost suffocated, and when sufficiently revived, said, "May I never get into it again, nor lay place the likes of it hereafter!"

Early in the morning we were off again for Cloverdale, while the huge white columns of vapor were rising high above the gorges in which their sources lie concealed; the cloudless sky was as blue as the purest of mountain air could make, and this great natural wonder of Sonoma county was fast receding behind us

No object of special interest beside those mentioned attracted attention, except Profile rock, two miles from Cloverdale, which bears an exact resemblance to the turbaned head of an effeminate Turk; and twelve miles from Cloverdale, Eagle rock, where for centuries the mountain eagles, undisturbed, reared their young; but a year ago, sheep raisers near by combined and killed them off, to save their lambs. Some measuring nine feet from tip to tip, were killed there. More anon.

J. W. A. W.

Cloverdale, Sonoma Co., Sept. 6, 1875.

TOO COSTLY A STYLE OF ARCHITECTURE.—Most American cities, for years past, have vied with each other in the lavishness of expenditure upon the magnitude and gorgeousness of the styles of constructions, both in buildings for public and private purposes. Such large expenditures of money upon many structures for commercial use, and particularly for hotels, have, in consequence, advanced rents, taxation and insurance so alarmingly that, as a natural result, thousands of tenantless stores and other buildings can be found in every city in the land.

Nothing is as easy to understand as the fact that if a store, hotel or dwelling is erected having thirty per cent. of its cost added through expenditures on elaborate style of construction, or excessively rich and expensive ornamentation that the rents charged will correspond with the outlay. This consideration, it is hoped, will have weight with those intending to build. Solidity and severe plainness will prove to be the best way to promote the commercial and domestic interests of any city or community, considering that low rents will retain as well as draw population.

MECHANICAL PROGRESS.

The Cold Metal Cutting Disc.

Considerable attention has lately been called to what is known as a saw for cutting iron and steel cold. It is not a saw but a disc. The disc is a circular plate of iron or soft steel forty-two inches in diameter and three-sixths of an inch in thickness, exactly like a circular saw of that size except that the disc has no teeth, and is left smooth on the outer edge, which is known as its periphery. The disc is mounted on a mandrel and provided with bearings, and a pulley for the belt to drive it. The disc and mandrel is turned up very accurately, and balanced on knife edges before it is put in place, so as to secure perfect accuracy in its operation.

Discs of this class have been used as experiments for many years. In 1854 Mr. Jacob Reese, of the Fort Pitt iron and steel works, of Pittsburg, then engaged as superintendent of the Clinton rail mill, built one twenty-four inches in diameter, quarter inch thick, for the purpose of slotting the ends of rails, but on trial found the disc to choke. In 1865, while engaged in manufacturing gas pipe, he put a disc in operation for cutting off the ends of the tubing, but found that in pressing the tube against the disc it burred the tube, and left a long fin on the side of the tube last cut, which was an objection and made it impractical. Some time afterward Mr. Kloman, of the firm of Carnegie, Kloman & Co., of this city, put a disc in operation for cutting iron girders and and beams, and although it made quite a fin still it proved profitable.

Soon after this Mr. Reese conceived the idea of cutting steel in this manner, and constructed a machine such as is described in this paper, adding a frame in front of the disc, on which is mounted a revolving chuck. This chuck is hollow, and the bar of steel is placed in it, and by suitable machinery made to revolve at the speed of two hundred revolutions per minute; while the bar to be cut revolves upward, the disc, at point of contract, revolves downward. The speed of the disc is equal to 25,000 feet of its periphery per minute. The machine is provided with a screw attachment by which the disc is drawn up to the revolving bar of steel. At the instant that the disc is drawn up to a delicate proximity to the bar, the steel bar melts away about as fast as a red hot table knife will melt a gutter into a piece of ice. The bar being turned 200 revolutions per minute it will be seen that the gutter is melted all around the bar, and when the disc gets to the center of the bar, it leaves but a small teat, thus really leaving a center mark. The ends of the bar when cut are as smooth as though polished. This improved disc being a success, and a profitable attachment to his works, he secured the improvement by letters patent, and is now building the machines as a matter of business.

Soon after Mr. Reese had secured his letters patent he invited the members of the American Institute to witness its operation. About 100 accepted the invitation, and expressed great astonishment at the same. Among the members who were present and witnessed the strange phenomenon was B. C. Lauth, Esq., of three-high-roll celebrity. On his return to England he described this machine to a friend who took out letters patent, and then built the machine, which the English papers have been claiming as an English invention. This is not the first time that Englishmen have appropriated to themselves honors due to the Americans.—*American Manufacturer.*

NOVEL MARINE ENGINE.—A new marine engine, designed to economize space, and to do away with all slides, eccentrics, link motions and other reversing gear, has recently been tried in a small steam yacht in England. It consists of three cylinders placed side by side and connected by a peculiar system of steam ports that open and close by movements from the three pistons that are made to act as slides. A three-throw crank joins the piston to the shaft and the three pistons; three connecting rods and the crank make the working parts. The ports all meet in a three-way cock, and by its movement the engine starts, stops and reverses at will and instantly. The cylinders and strokes are each seven inches, and under ninety pounds pressure and 380 revolutions, the engine indicated forty horse power, and the yacht made thirteen miles against a slack tide in seventy-five minutes. The engine is attracting much attention among engineers and boat owners. An engine having three cylinders grouped together has also been recently patented in this country, but, from the drawings published, it seems to be more complicated than the English engine.—*Ex.*

NEW METHOD OF JOINING IRON HOOPS.—It is claimed that the ends of the hoops on barrels may be securely joined with great economy of time and labor on the following plan, devised by Cattin: A small plate of sheet metal has two slits punched in it, in such a way that the hoops may be drawn through them readily in one direction, and are prevented from slipping out by the sharp edges of the plate cutting into them. The surface is rendered smooth by a blow with a hammer on the projected ends of the hoops.

CONDENSED AIR as a street car motor, has, it is said, been abandoned in New Haven, on the ground that horse power is more profitable.

An American Invention.

The (reported) new Austrian "Uchatius" cannon, the mode of the manufacture of which was described in these columns three weeks ago, turns out to be an American invention revived by Gen. Uchatius. According to the *Scientific American* his claims as to originality are opposed by those of Colonel Rosset of the Italian, and Colonel Naroff of the Russian army, both of whom state that they also separately conceived the idea of thus treating bronze guns as early as 1873.

The results which have been reached in testing guns of steel bronze, some of which have withstood the firing of 3,000 rounds without any diminution of accuracy of fire or deterioration in any other respect, prove the invention to be of more than ordinary importance. Consequently it is all the more gratifying to Americans that the invention is neither an Austrian, an Italian, nor a Russian invention, but one first devised by Samuel B. Dean, of Boston, Mass., and patented by him in this country and in England in 1869. Mr. Dean's claim is, "as a new manufacture, a bronze gun in which the metal immediately surrounding the bore is put in the condition by the process of condensation set forth," which process is identically the same as that employed by the Austrian general.

It appears further, and the fact may not be so gratifying to Americans as that just mentioned, that Mr. Dean patented his invention in Austria in 1869. Three years later Gen. Uchating of the Austrian army comes out with precisely the same idea, and is backed up in its ownership by Austrian authorities, who reward his alleged discovery by permitting him to sell out rights for certain countries, other than the great powers of Europe.

The records of the U. S. Ordnance Office show that an order was given in July, 1870, for a number of these guns, but that, through lack of funds, the same was countermanded. Colonel Laidly, of that office, expresses the hope that the next Congress will make a suitable appropriation for the introduction of Mr. Dean's invention into our service.

Baking Brick.

A brick manufacturer in Wales has invented and introduced a new mode of making bricks. After the grinding process has brought the clay and powdered stone and liquid compound into the condition of mortar, it is delivered to the moulder, who with much dexterity deposits the composition into a double mould, places it in a press which answers the purpose of pressing closely the bricks and of forcing them out of the mould. Then a lad carries them on a sheet of iron and places them in the oven for drying under the new process. This oven is constructed very much on the same principle as a baker's oven, only considerably larger, but in lieu of one floor there are several tiers constructed of upright and horizontal irons about five inches apart, upon which to lay the bricks, so that the oven can be filled from bottom to top, capable of storing about 10,000. When the oven is full, the iron doors are closed up air tight. A description of flues admit the hot air, and the bricks are thoroughly dried in from three to four hours. To show the advantage of the new process over the old, it is stated that, whereas under the old process it would take twelve hours, with the consumption of two tons of coal and the labor of several persons over a large area of ground, to dry 5,000 bricks, under the new system 10,000 bricks can be dried in three or four hours with two hundred weight of coal—a very small cost, with less than half the manual labor, and without the extreme exhaustion caused to the workmen from being hours in the old dry houses; for with the new process the oven is as comfortable as a workman's kitchen two minutes before it is heated, and can be entered two minutes after the doors are opened. This important novelty in the manufacture of brick has recently been tested with the most perfect success.—*American Builder.*

STEEL CASTINGS.—The use of steel castings for agricultural purposes, machinery, wagon skeins and boxes, etc., is one of the most important inventions of the past few years. Pittsburg seems to have taken the lead in bringing this branch of the steel trade to a successful issue. Many tons a week of plow points alone are said to be turned out in Pittsburg alone. There is also a large call for steel wagon boxes and skeins, gearing, pinions, etc.; while a great variety of castings to take the place of expensive forgings, keep up with the capacity of different establishments now successfully in the business. One great advantage of the annealed castings is that they can be drawn under the hammer or cut with shears the same as rolled or hammered steel. This is especially a valuable feature in agricultural steels.

IMMENSE STEAM HAMMER.—It is intended to build at the great steel works in Essen, Prussia, a new steel hammer, capable of working a mass of metal 100 tons in weight. It is estimated that that this machine, which will be the most powerful in the world, will cost $1,000,000.

BALLOONING experiments have been made at Woolwich, England, in ballooning for military purposes. Balloons were guided backward and forward in any desired direction by Menier, the inventor, in a still atmosphere. The test of the value of the invention will be its success in currents of wind.

SCIENTIFIC PROGRESS.

Remarkable Effects of Arctic Cold on Man.

Lieut. Payer, the Austrian Arctic explorer, has been laying some of the results of his explorations before the Geographical Society of Vienna. Referring to the influence of extreme cold on the human organization, he related that on March 14th, 1874, he and his companions made a sledge journey over the Semiklai glacier, in order to make observations of Francis Joseph land. On that day the cold marked 58° Fah. below zero. Notwithstanding this intense cold, M. Payer and a Tyrolese went out before sunrise to make observations and sketch.

The sunrise was magnificent; the sun appeared surrounded, as it does at a high degree of cold, by small suns, and its light appeared more dazzling from the contrast with the extreme cold.

The travelers were obliged to pour rum down their throats so as not to touch the edge of the metal cups, which would have been as dangerous as if they had been red hot; but the rum had lost all its strength and liquidity, and was as flat and thick as oil.

The metal of the instruments was just like red hot iron to the touch, as were some lockets which some of the travelers, romantically, but imprudently, continued to wear next the skin.

M. Payer says that so great an amount of cold paralyzes the will, and that, under its influence, men, from the unsteadiness of their gait, their stammering talk, and the slowness of their mental operations, seem as if they were intoxicated.

Another effect of cold is a tormenting thirst, which is due to the evaporation of the moisture of the body.

It is unwholesome to use snow to quench the thirst; it brings on inflammation of the throat, palate and tongue. Besides, enough can never be taken to quench the thirst, as a temperature of 35½ to 58° below zero, Fah., makes it taste like molten metal. Snow eaters in the North are considered as feeble and effeminate, in the same way as is an opium eater in the East.

The group of travelers who traversed the snow fields were surrounded by thick vapors formed by the emanations from their bodies, which became condensed, notwithstanding the fire in which the travelers were enveloped. These vapors fell to the ground, with a slight noise, frozen into the form of small crystals. Notwithstanding the humidity of the air, a disagreeable sensation of dryness was felt.

Every sound diffused itself to a very long distance; an ordinary conversation could be heard at a hundred paces off, while the report of guns from the tops of high mountains could scarcely be heard. M. Payer explains this phenomenon by the large quantity of moisture in the Arctic atmosphere. Meat could be chopped, and mercury used in the shape of balls.

Both smell and taste become greatly enfeebled in these latitudes; strength gives way under the paralyzing influence of the cold; the eyes involuntarily close and become frozen. When locomotion stops, the sole of the foot becomes insensible.

The only possible protection against the cold is to be warm clothed, and to endeavor as much as possible to prevent the condensation of the atmosphere, while the much vaunted plans of anointing and blackening the body are pronounced to have no real value.—*Scientific American.*

The Burning of Oxygen and Hydrogen.

M. Neyreneuf has decribed two methods of showing the vibratory motion attending the explosion of a mixture of oxygen and hydrogen in a cylindrical tube; first, by using tubes carefully dried, and secondly, by covering the interior with paraffine. In the first case the steam condensing on the colder parts leaves transparent the parts which the flame in vibrating has more strongly heated. The latter are, on the other hand, shown in the second case by the melting of the paraffine. It is indispensable that the combustion shall not be too rapid; and further, to obtain the best effects the proportion of the mixture should be varied with the dimensions of the tube. With a tube one and one-quarter inches in diameter and about eight inches long, containing one part of hydrogen and one of air, lines appear resembling fern leaves. With tubes of less diameter the effects are more regular, especially if a musical sound is produced by the explosion. Fine strias are then observed perpendicular to the axis of the tube. When the tube is very long, there is only a confused sound, but the strias are well separated and sharply defined. If the mixture is ignited by the eudiometric method, these appearances are no longer produced. If the tubes open at both ends, the effect is the same as if one end is closed. With a long tube the appearance in the dark is the same as that of a Geiseler tube illuminated by a single motion of the breakpiece.

INCOMBUSTIBLE PAPER.—A French paper recently announced the discovery of an incombustible paper, of which may be made all State and law documents of any importance, and last, if not least, the bills of the bank of France. The importance of this discovery may be easily appreciated.

The American Association for the Advancement of Science.

The regular annual meeting of the above named association convened at Detroit, Mich., on the 11th of August. Hon. O. J. Walker, of Detroit, delivered an address of welcome, to which Prof. Hilgard, as President of the Association, made a suitable response. The retiring President, Prof. Lo Conte, in his address dealt with the evidences of evolution, and he endeavored to show that, while change of species may be admitted in creation, there still is reconcilable evidence of intelligence and design. He discussed the strict relation of natural history or biology to that mass of learning and influence which is commonly called theology, and to that smaller mass of belief and action which is called religion; and in reference thereto stated that it will be necessary to separate the essential truths of religion from the accessories of tradition, usage, and, most of all, organizations and interpretations, which have in the lapse of time gathered around the primitive or revealed truth. In conclusion, the speaker considered that the influence of science upon religion has been beneficial. Scholastic interpretations founded upon imperfect knowledge, or no knowledge but mere guess, have been replaced by sound criticism of the texts and their exegesis, in accordance with the times and circumstances for which they were written. Prof. S. P. Langley, of Allegheny, read an interesting paper on the Solar Atmosphere, a brief *resume* of which was given last week. He also presented an essay on "Carbon Determination in Steel and Iron." Prof. Dawson read an able address on "The Origin and History of Life on our Planet," extracts from which we shall give hereafter. These are all of the proceedings which have as yet come under our notice.

PROGRESS OF TELEGRAPHY—ONE WIRE FOR MANY INSTRUMENTS.—The *Golos* announces the arrival at St. Petersburg, of M. La Cour, assistant director of the Copenhageu Physical Observatory, in order to submit to the telegraphic conference a new invention in telegraphy. That invention gives the possibility of transmitting despatches between two telegraphic stations through one wire only, and by means of many instruments, so that transmission by one instrument cannot impede the action of the other. M. La Cour, while engaged some years ago in investigating the passage of electric currents through conducting media, found that electricity is transmitted from place to place by undulations analogous to those of sound. In consequence of this discovery, he hit upon an arrangement of electro-magnets and tuning forks, by means of which a particular current passing through a tuning fork pitched to a certain note does not become merged in or confounded with other currents which, after passage through differently pitched tuning forks, are simultaneously transmitted along the same wire. This, of course, renders it possible to send many messages at a time through a single wire.—*Telegraphic Journal.*

DANGEROUS EXPLOSIVE MIXTURE.—The Irish Court of Queen's Bench recently granted a motion to draw out of court a sum of £1,500 tendered by the Governor and Directors of the Apothecaries hall of Ireland, as compensation for the consequences of their mistake in selling a packet of sulphide of antimony for oxide of manganese.

A man named Marsden, intending to make oxygen, mixed chlorate of potash with the sulphide of antimony, instead of the black oxide of manganese, and from the explosion which followed, he was killed, and his wife severely injured.

Chlorate of potash detonates with great violence when heated with sulphur or carbon, or with compounds containing these elements. Too much care cannot be exercised in making oxygen to be assured that the oxide of manganese used is free from contamination.

PHOTOGRAPHING CHILDREN.—W. A. Nicholas, Australia, says: As nearly all children are photographed in white dresses, and the faces are a great deal tanned through exposure to the sun, I have found a useful help in a single wax match. If I have been unable to get full exposure through the restlessness of the little sitter in dull weather, by lighting a match and holding it just under the face only, so as to make that part of the plate hot during development, it is astonishing the increase of detail I get. There is no danger of the plate cracking through uneven expansion.

ELECTRICITY IN THE ARTS.—Electricity is gradually working its way into an important position as an aid to industrial arts. It has recently been announced that a joint stock company has been formed in London with a capital of one million dollars, for the manufacture of Gramme's magneto-electric machine, which is confidently expected will soon be widely applied to the production of light, to the electro-deposition of metals, and to various chemical manufactures, etc.

CONCENTRATED FIRE OF ARTILLERY.—Herr Krupp, the Prussian cannon manufacturer, is making experiments to prove that the concentration of several guns on one spot in the side of a cuirassed ship and their simultaneous discharge quadruples the destructive power of the guns. The guns are discharged by electricity, and the experiments are proving highly successful.

Mining Summary.

The following is mostly condensed from journals published in the interior,in proximity to the mines mentioned

California.

AMADOR.

The Mines.—Amador *Ledger*, Sept. 11: During the heat and excitement attendant npon a politicsl cauvass, other matters are geuerally for the time heing overlooked. Hence, for some weeks past we have not given thst attention to onr mining interests that their importance deserves. We are glad to report that quartz mining remains unchanged, our developed mines yielding their regular returns, with appearance of an incresse of gold as greater depths are reached. Indeed the quartz mines of the conuty never looked more hopeful than at present. Owing to the scarcity of water placer mining has nearly ceased, but will be resumed with renewed vigor on the incoming of water this winter. A number of hill claims have been 'prepsred for hydraulio washing as soon as water can be had, and others will be worked on a large scale this winter. From appearances we think there will be more placer mining carried on this winter in the vicinity of Jackson aud Sntter Creek, than has been done for a number of years past. The waters in our mountain streams are lower st the present time thsn has ever before been known, but fortunately not likely to reach a lower stsge. The long and exoessive hot weather has told heavily npon our water supply, but we are informed, that by reason of the cool nights in the mountains, with a corresponding change in temperature lower down, the streams are increasing in volume, and hence will increase slowly nntil the rains set in. In the meantime the Amador canal affords a supply to onr principal quartz mills.

Rich Rock —*Dispatch*, Sept. 11: A lot of very superior quartz has just been struck in the Good Hope mine, near this place, and we nnderstand that the indications are that there ie a large quantity of this rock in deposit there. We have full faith that this mine, if fully developed, will prove to be one of the richest in our county.

McKay and Love. — Footill *Ensign*, Sept. 11: Thie mine is located about two miles above Jackson, and is said to be a continuation of the same lead now worked in the Eureka and other mines, the rock being very similar in its character. A shaft has heen sunk to the depth of 60 ft, when the flow of water became so great as to prevent further sinking. They are now running a drift 200 ft in length to connect with the shaft, for the purpose of drainage. The ledge ie well definsd, averaging from eighteen inches to 3 ft iu width. No rock has been crushed, but an assayed ssmple proved it to he of a good paying character. It is the intention of tha ownere to pnsh operations on this looation, as they are confident they have a good thing.

CALAVERAS.

Enterprise Consolidated.--Calaveras *Chronicle*, Sept. 11: The extensive and fortunate developments of this company, in the West Point district, are attaining a prominence which promises to enrich the ownere and to be a sonrce of pride for the county. The uow principal works of the Mina Rica are situated on an ore body 232 ft in lenglh, which averages 4 ft wide, and wae worked years ago to the depth of 135 ft. The new shaft ic 12 ft by 4, in the clear, and is now 175 ft deep. Siuking progresses at the rate of 9 ft per week. The 40 ft of backe attsined show a uniform width of 4 ft, containing 18 inches of very high grade ore. The whole is eetimated at $40 per ton. The hoisting works are driven by a 16-horse power horizontal engine, conenming three-fourthe of a cord of wood in 24 hours. Engineers aot as "tub-landers." A pump is employed two houre out of twenty-four iu emptying a water tank placed at the depth of 150 ft. No water to speak of below it.

The company own another mine, the "Maria," about one mile west of the Mina Rica. A transverse tunnel taps the first vein at a considerable depth, and hae been extended on the lode 120 ft. The ore averages 2 ft in width and ie estimated to yield $15 per ton. The main tunnel will be extended, shortly, to nine other lodes which crop east of, and parallel with, the vein now being developsd.

About 400 yards south of the Maria is located the company's 8-stamp mill, driven by a large overshot wheel and free water. A Hepburn settler and two Wheeler pans are employed. This mill has done well for prospecting purposes, hnt the extenoive and valuable backs of the Mina Rica alone neceseitate the erection of a large new mill near the mine.

Happy Valley Hydraulic.—Good progress ie being made in running the bedrook tuunel, in the Happy Valley hydraulic, through which the flume is to he laid in order to reach the bank of gravel. It is expeoted that the tunnel will be completed by the time the raine set in, and that everything in cuunection with the mine will be in readiuese for vigorous piping as soon as water oan he obtained. The Happy Valley hydraulic will have the longest flume of any mine iu the county—about a mile—and when it gets into full operation we shall he surprised if it don't require ae long a sack as any of them to hold its product.

EL DORADO.

Extensive ann Rich.—*Republican*, Sept. 9: Further prospecting npon the ledge mentioned by us recently, as having been discovered by Mr. Veach, near the Baltic mill, warrants the belief that the ledge is both extensive and rich. Mr. Veach has shown us some very fine specimens of rock taken from it. The ledge is probably on the same vein as the Mt. Pleasant mine, which is now in very successful operation.

INYO.

The Sunrise.—Panamint *News*, Sept. 8: Thia mill is running regularly, and a few days sgo made a shipment of bullion, some $2,000, just to show them that the thing can be done. They have now on hand quite a large amount of amalgam, and another shipment will be made in a few days. They sre working their ores np seventy per cent. of their value, without roasting.

The Surprise Mill.—Below we give the figures for September 7th, of the workings of this mill, as taken from Mr. Stetefeldt's books: Chlorinations, first charge (extra fine), 95.6-10. Average chlorinations, during day shift, from furnace shaft, 93.5-10; from the flue, 95.9-10. During night shift, from the shaft, 91.5-10; from flue, 95.00. Pulp ssmple, $95.39 per ton; tailings, $7.06 per ton. Bullion, 978 in fineness. Salt used, 3 to 3¼ per cent. We do not think that these fignres have ever been eqnalled by any other mill, nnless, perhaps, by the Manhattan, at Anstin, which also operates with the Stetefeldt furnace, and on ores averaging $200 ner ton. The Surprise mill has heen rnnning uninterruptedly for the past fifteen days, crnshing twenty-five to twenty-eight tons of the Wyoming ore every twenty-four hours. Ore fom the Hemlock mine will soon be delivered at the mill, when the working will be increased twelve to fifteen tons more per day.

MARIPOSA.

The Mariposa Estate.—*Gazette*, Sept. 11: The main working tunnel now being driven from the Ophir mills on the Merced has now attsined a total length of 1,112 ft, with the heading in rough trap rock. There does not seem to be auy grit whatever in the rock, and the holes are made by a grinding process. One might well say that each foot now made had to be fought for. Captain Hewett, iu charge at the river, does not recollect the time when he has seen tougher material to contend with. Arrangements are now being made for firing with a battery, and also for putting in a system of electric signals. The Buffalo carriaga now in nse is a great improvement over the old style of single carriages. Its use permits the cars to run under the carriage and remove the waste, while the drills aleo are in operation. The amount of water flowing from this tunnel also is on the inorease. Each day develops new water conrses, some of them being quite large. Taken altogether the proepect of the Mariposa laud and mining company, in this direction, is considered very good indeed.

NAPA.

Iron Mine.—Napa *Register*, Sept. 11: We have heretofore had occasion to refer to Mr. Sharp's irou mine in Chiles' valley. Mr. Sharp sold the ore by the ton on the ground to an Eastern company, who hanled it out, and shipped it at St. Helena, to San Francisoo, whence it was sent to some Eastern smelting works. The enpply, it eeems, hae suddenly given ont, at least the purchasers think so, for they have abont ceased operations, after taking 170 tone. Mr. Sharp got $5 a ton on the ground, or could have got $10 at St. Helena, and thought when he first made the bargain that thsre would he some thousands of tone to remove. He was at eome expense in opening roads, and owing to the sudden cessation of operatione only comee out about even. He thiuks thongh, there is still a good deposit, by digging a little, and will try it himself presently. The ore ie of superior quality and is worth going after.

NEVADA.

The New York Hill.—Grass Valley *Union*, Sept. 11: We mentioned a few days ago that the last clean-up of the New York Hill mine, yielded about $15 to the ton of rock crushed. Hitherto we have chronicled ornshing from that mine, none of which ever came under $75 to the load. Since the New York company has leased the Larimer mill, the ore crushed is reckoned by the ton of 2,000 pounds; before the leaee the ore was estimated by loads of 3,500 pounde. Taking these differences in the number of pounds in a ton and in a load, the cruehing would give about $78.75 to the old fashioned load. So the rock hae not fallen off in richness, hut there is a differenoe in the eize of a ton and that of a load of ore.

Good Clean up.—*Union*, Sept. 9: A day or two ago the New York Hill mine had a clean-up. That mine is in the habit of doing good work in the way of cleaning np. This time, 422 tons of rook were crushed, and the yield was 1,019¼ ounces of gold which is worth in round numbers, $17,500. Besides this gold, there are 16 tons of sulphurets remaining to be worked hereafter. The New York Hill sulphurets, at the laet working, paid $104 a ton, and this gives us a yield of $45 per ton for the rock worked.

Eureka Mine.—The superintendent's letter, dated September 4th, says: The clean-up for the past six daye is 200 ounces of amalgam. The 12th level cross-out is in 533 feet from the shaft; ground hard, with no improvement in the indications. The 5th level cross-out is in 213 ft. In Eureka No. 2 the west drift is in 235 ft, with good walls, but no ledge; the east drift is in 200 ft; ledge small and split, No. 3 shaft is sunk and timbered 71 ft.

Howard Hill Mine.—*Union*, Sept. 14: A shipment of $4,000 was made from this mine the latter part of last week, and a further shipment, a clean-np from the plates, wss made yesterday, but the amount we did not learn. Everything is looking well at tha mine, and the stamps of the new mill are kept constantly employed. The rock being crushed is mostly taken from the 300-ft level, where tha ledge is strong, averaging four ft, and produces a fair qnality of paying ore. The main shaft is down 400 ft, and the drift has been run east into the old Cambridge ground, where the rook improves in appearance as the drift is extended. A great deal of dead work has been done in the mine to put it in a condition for systematio operations, and it is only now heginning to pay its way. With the opening ont of the fourth level there will be a large extent of backs, from which plenty of rock can he oheaply mined, and handsome runs and profits are confidently anticipated.

Prospect Mining Co.—*Foothill Tidings*, September 11: This compauy have, we underatand, recently purchased a new mining property, sitnated below the Allison Ranch mine, which they intsnd to develop at once. A meeling of the stockholders is oslled for the 15th inst.

Shanohai Mine.—Thia property, situated on Massachusetts hill, hack of the old Rocky Bar mine, is now worked by Jones & Co., and we are glad to learn that they ara meeting with good aucoess; the ledge being of good size and the rock looking well.

Colbert & Co. are siuking a shaft on the Bays' Ranoh ledge. This property has been idle for some time, but the owners have faith that it will maks a number one mine when they get it properly opened, and they have now started to proapect it thoroughly.

Kentucky.—The drift on the 300-ft level has reached a point on the ledge 100 ft east of the shaft, where they have a ledge from 12 to 15 inchee thick, which shows well in sulphurets. The ground is good, with a large increase of water coming in at the face of the drift.

PLACER.

The Crater. — Placer *Argus*, Sept. 11: Thongh there is sufficient fine ore in sight to run the company's mill for the next year without sinking another foot, the St. Patrick Co. is erecting new and powerfnl hoisting works, with pnmps, etc. to sink and prove the value of the mine below the present depth; and the rich ore fonnd in the, at preeent, lowest level—440 ft—ie certainly a strong inducement to do so. The olean-np of the St. Patrick mine, on the 7th of September, shows still an improvement on former runs. Running time of the mill, 22 days, orushing 430 tons of ore, yielding 1,090 ounces of gold. Two hnndred tons of ore are left at the mine to begin the next crushing.

The Julian.—*Herald*, Sept. 11: The Julian quartz mill, on Jenny Lind flat, helow Newcastle, is compelled to lie idle much of the time just now for the want of water. The mine itself, we learn from the owner, Mr. Schnabel, is looking well. The ledge is large and well defined, and very uniform in ite yield. Always paying expenses, and, as the Scotchman would say, a wee hit besides.

A slab of quartz rock was shipped below last week from the Greene mine, containing something over two square feet, through which there was a streak about four inches wide that waa nearly or quite half gold. The piece was eetimated to contain at least $1,500. Of conrse this wae a specimen, and a rare one, though all the rock now being taken from this mine at present is immensely rich.

PLUMAS.

Meadow Lake.—Plumas *National*, Sept. 11: An old Quincyite, writing from this place, gives a hopeful lookout for these mines. He says: "There are hnt few people here at the present time, but most of them are at work on their locations. We hardly expect to accomplish anything this season, bnt want to get things in ae good shape as possible for next spring, when we expect things to "howl" here again, as in former days. The ore is here and in paying quantitiee, and there ie hut little doubt that we will have a cheap, practicable process of rednotion. We expect to get returne from Prof. Fryer in a few days, and the future of Meadow Lake will depend very mnch on hie report."

"A Chunk of Brass."—Some time this epring a man named Taylor came to this place, directly from Michigan, and has been in the employ of Mr. Meylert ever since until last week. For a while he was making lime at the kiln npon Spanish oreek. During his stay here he collected a number of specimens of qnartz, rock, etc., to show to his Michigan friends. Last week he started below for the purpoee of going home, and rode to Oroville with Mr. Rodgers, of this place. On the road he opened his carpet sack to put in a specimen whioh Mr. Rodgers gave him, and that gentleman, while looking over the collection, discovered a "chispa" which Taylor said was a "chunk of brass," which he picked up in the tailings, near the lime kiln. It proved to be a nugget of gold, weighing something over 5 ounces, and Rodgers says that there was one happy emigrant when he informed him what he had fonnd. It had been in his overcoat pocket in the har room of Meylert's hotel for some weeks before he started. Taylor is coming hack in a short time with hie family, and if he don't "etrike diggings," there ie no use of anybody looking for them.

SONOMA.

Mining Notes.—Sonoma *Democrat*, Sept. 11: The Great Eastern mine, near Guerneville, is turniug out hetter than the most eanguine expectation of its owners. A six weeks' run, retorting two tons of ore every twenty-four honrs, has yielded over one hnndred and eighty flasks of mstal. Their new furnace, now in course of constrnction, will he running insida of ten days. It is the Waldhridge improved patent, and is calculated for working ten tona a day. The Great Eastern is unqnestionably one of the best mines in the county. Mr. Haskins is the superintendent.

The Mount Jackson is rebuilding their furnace; adding a new ore chamher and changing the character of the redaction works. The mine has greatly improved as the work of development progressed, in the past two months; it is unquestionably the same ledge as the Great Eastern. John Cntter, formerly of American mine, is building at his own expense a furnace for experiment, adjoining that of the Monnt Jackson; intending to nse the condensers of the Jackson works.

At the Oakland mine, near Geyser peak, brick are being hanled as rapidly as possihle for the pnrpose of building a large Green furnace. This mine looks splendid. In the lower ohannel, at a distance of two hundred and fifty feet, they have cross-cut the ledge and drifted one hundred and fifty feet each way on the ledge, showing good metal. In the northwest drift they are sinking a shaft, probably fifteen or twenty feet. At a depth of sixty feet they were taking ont splendid metal. They have on the lower dump two hnndred and fifty tons of metal. Stewart & Kellogg have a contract with the owners to fnrnish the brick for the new furnace. They also have a contract to work two hundred and fifty tons of ore at the Ida Clayton furnace near Kellogg. They haul the brick from kilna near the Ida Clayton mine, and hack load with ore. The oompany expeot that metal from the two hundred tons of ore will more than pay the entire cost of building the furnace. William Davis ie the superintendent of the mine, and it is in splendid condition.

The Missouri is running a deep tunnel into their mine. The Rattleenake have force enough to keep np the work in their two tunnels. Tha owners of the Bacon and Edith mines, near Pine mountain—the English company—are building a large furnace.

TRINITY.

The Ward Mine.—Trinity *Journal*, Sept. 11: The Ward mine, on the Oregon Gulch monntain, ie being placed in the best poseible working order under the supervieion of O. M. Loveridge, the energetio superintendent of the Weaverville ditch & hydraulio miniug company.

Buckeye Ditch.—Captain George H. Atkins, superiutendent of the Buckeye water and hydraulic mining company, informs us that work is rapidly progreseing on the ditch. Six milee of the upper end—by far the hardest portion to bnild—are completed, and the remaining 10 miles will he finished at an early day. The company has made arrangements for the purchase of tha Cnuningham mine, on Bolt's ihll, one of the richest placer olaime in the county. Weather permitting, they will have the water from Van Matre oreek on this Bolt's hill property by the latter end of October.

TUOLUMNE.

Will Resume Work. — Tuolnmne *Independent:* Mr. D. T. Hughes, snparintendent of the Patterson mine, at Tuttletown, has received notice from Mr. Carrigan, the owner, that work will ba resnmed in two or threa weeks.

Marks & Darrow Q. M. Co.—The men employed in this and surrouuding mines have enjoyed a hot apell, or as it might bs oalled, a heated term. For eome days during August, in Tuolumne. mining district, Fahrenheit showed 102 and 104 degrees in the ehade, and pretty snltry at nights. Recent visitors, after inspecting the cooler spots (in ahafts Nos. 3 and 6, and standing on the metallio slate,) were regaled by some chipe from the old block—the big vein in ahaft No. 5. The main hoisting shaft, (new) No. 6, has some 80 ft yet to go ere drifte will be run north and south to the maiu lode as exposed in Nos. 2, 3 and 5. An additional shift is to be put on the eneuing week, and some engineering work of some import, which we ehall speak of in due time. We would (for we could) say more of thie and other mines in our connty, bnt they speak for themselvee, and are not on or in the market. If they should, and when they do, need capital, there is no donbt many of onr California mines can command it.

Mining Machinery. — Sonora *Democrat*, Sept. 11: The machinery intended for the New Alhany mina is being rapidly completed by Phelps, Shepard & Cowie at their fonndry.

Nevada.

WASHOE DISTRICT.

Ophir.—Gold Hill *News*, September 9: Daily yield, 200 tons of ore. There is little or no ohange in the value or qnality of the ore extracted. Most of the work now being done on the 1600 and 700-ft levels ia confined to repairs to the several drifts and cross-cnts, preparatory to more energetic prospecting operations. The erection of the new powerful pnmping and incline hoisting machinery is making steady and favorable progress.

Consolidated Virginia.—Daily yield 600 tons of ore. No change in either the prodnction of the mine or qnality of the ore extracted. The ore hreasts are looking finely as nenal. The usnal monthly dividend of $10 per share was declared on the 7th inst., aggregating $1,080,000. The yield for the past month wae sufficient to allow of the usual returne of $1,600,000, with a considerable surplua to oarry over to

next month. The mills are all running, and there seems only prosperity and success ahead.

Sierra Nevada.—A station has been completed, and a drift started west of the 1000-ft level of the new shaft to cut and prospect the ledge. This drift will open the mine a depth of 300 ft lower down than it has ever before been prospected, and is an item of very important interest to the mine owners on the north end of the Comstock, as it penetrates virgin ground at a greater depth than has ever before been reached on that portion of the ledge. The north and south drifts on the 700-ft level of the old shaft are steadily advancing, without change of interest to record. Sinking the new shaft is going rapidly forward.

Belcher.—There are now about 4,000 tons of ore accumulated in the ore dumps, ready for milling. This surplus is entirely occasioned by the inability of the mills on the Carson river to crush their full capacity of ore, on account of the low stage of water. As soon as the supply of water will permit, the amount of ore extracted can be greatly increased. There are no new features in any of the prospecting operations on the different levels of the mine. Work on the 1600-ft level is going ahead as usual, and the air shaft is nearly completed down to the 1300-ft level.

Bullion.—The combination drift on the 2000-ft level of the Imperial mine, is advancing steadily without any valuable ore developments to note. The face of the main north drift on the 1700-ft level of the Imperial, is in a fine character of quartz and ore, fair headway being made. Enlarging and sinking the main incline shaft is going steadily forward at the rapid rate of 5 ft per day. Everything is in fine working condition, and the appearances are that the Ballion will yet be added to the list of our dividend paying mines.

Hale & Norcross.—The main west drift on the 2200-ft level is steadily advancing. No new features to chronicle. Driving the south drift from the bottom of the winze on the 2200-ft level, to connect with the north drift on the same level, is making fair headway.

Caledonia. — Everything working finely. Sinking the new shaft is making excellent progress. Sinking the old incline is also making good headway, notwithstanding a strong flow of water encountered at the bottom.

Chollar-Potosi.—There has been a few days' delay in the extraction of ore, owing to an excess of ore in the dumps, beyond which no important changes have taken place during the week. Prospecting on the 1150, 1250 and 1350-ft levels is still carried on, without any valuable developments to record. Sinking the combination shaft is making the usual fair rate of progress. The large, handsome hoisting works building is rapidly nearing completion.

Dayton.—The tank pit below the third station level is fast approaching completion. The pump bob and other machinery is fast being placed in position, and it will now be but a short time before everything will be in complete readiness for resuming the sinking of the main shaft. The water is entirely drained from the third station level, everything being found in almost as good repair as at the time when the mine was shut down.

Florida.—Main west drift advancing well as usual. It is draining the first winze in the old tunnel workings, and when this is done, the winze will be sunk deeper. Some very good milling ore was found at the bottom of it, but the great influx of water stopped work. This tunnel now comes to the rescue, and will assist very materially in developing whatever good ore may be there.

Leo.—Making good progress, driving main drift northward from bottom of wiaze; are in a distance of 43 ft to-day, the ground still quite dry and favorable for working. Face of drift is still in ledge matter of excellent character, carrying numerous veins of fine looking quartz Ledge contianes large and well defined.

Buckeye.—The pumps and other machinery are working splendidly, and the shaft nearly drained ready to resume sinking the main incline. The prospects of the Buckeye are very favorable for the development of good paying bodies of ore at a much greater depth than has ever before been attained in the mine.

Savage.—Drifting north on the 2000-ft level is making a fair rate of speed; no change of interest. The drift north on the 2000-ft level is also making rapid headway. Sinking the main incline goes steadily forward without change of value.

Imperial-Empire.—Stopes have been opened between the 1850 and 1950-ft levels and the extraction of ore fairly commenced. So far as opened the ore body is showing finely. Prospecting in other portions of the mine afford nothing of value to record.

New York Con.—The powerful new surface machinery is being put in position as fast as possible. The requisite buildings are completed and Superintendent Apple is of the opinion that he will have everything in readiness to start up about the 1st of next month.

Leviathan.—The drift at the 420-ft level is getting well into the main ore vein, and good developments are daily looked for.

Overman.—The south drift from the bottom of the winze on the 1100-ft level has been driven ahead 20 ft during the week with no valuable changes to record. The south drift on the 900-ft level is again advancing. The west drift from the 1100-ft level is also again being driven ahead.

Utah.—Everything in and about the mine working finely. Sinking the shaft is making excellent progress. The flow of water is still strong, but is easily handled by the pumps. Prospecting the 400-ft level to the northward has been vigorously resumed.

Lady Washington.—The pump tank chamber at the 260-ft level is nearly completed, the framing and other carpenter work of the tank is being done, and the joints of the new pump are being fitted together preparatory to lowering.

Cosmopolitan.—The ore in the face of the main tunnel assays about $30 to the ton, and shows increase of width during the past week. Some very good ore is also met with in the winzes below the tunnel level.

Crown Point.—Extracting the usual amount of ore from the upper levels of the mine. Sinking the south winze on the 1600-ft level goes steadily ahead, without change of value. Driving the main east prospecting drifts on the 1700-ft level, as usual, with favorable prospects of soon reaching the main ore vein.

Yellow Jacket.—The north and south winze below the 1740-ft level are both being steadily driven downward, the bottom of each still being perfectly dry. The cross-cuts west from the north drift on the 1740-ft level have just been started, the face of each being in very favorable ground.

Silver Hill.—The bottom of the north winze on the third station level, on Monday last, encountered a flow of water so strong that work had to be suspended in the winze for the present. The bottom of the winze at the time of the suspension was in a fine character of quartz, with favorable indications of good ore developments ahead. Nothing new of the east cross-cut on that level. Work on the shaft progressing as usual.

California. — The north prospecting drift on the 1550-ft level is still in fine ore. Sinking the C. & C. shaft is making the usual good progress. Work on the mill is going ahead rapidly.

Idaho.

Golden Chariot.—Owyhee *Avalanche*, Sept. 10: The carpenters are vigorously at work on the new building, and the engine and boilers will be in position as soon as possible. There will be no delay in starting up the works when the balance of the machinery arrives from San Francisco. In the new discovery sections of the 1st and 2d levels of the mine, the developments have recently been very promising. From the 4th and 9th levels the ore that is taken out is reported to be richer in quality than any that has yet preceded it from any part of the mine. Much good ore is also coming out of the 4th Minnesota level, and altogether the Golden Chariot is in a very satisfactory condition, and bears a promising look for the future.

Silver Cord.—Stoping will be commenced in a few days. The new boiler has been placed in position, and the machinery for the new works is nearly all on the ground.

South Chariot.—The drift of the 11th level is making satisfactory progress. The stoping between the 9th and 10th levels has resulted in developing a splendid quality of ore, considerable quantities of which are now taken out daily. The mine is in good condition throughout.

Pauper.—The ore house has been enlarged and improved, and the works generally have been renovated and put in first-class shape. The hoarding house adjoining the mine has also undergone sundry improvements and has been made capable of accommodating a larger number of occupants. The superintendent states that the mine will in a short time be doing a splendid paying business.

Mahogany.—The stopes are looking well and a large quantity of good looking ore has been taken out during the past week. There is the usual force of men at work within the mine and on the surface.

Ina Ellmore.—Cross-cutting has commenced on the 12th level. At the 13th level cross-cutting for the ledge will soon commence. Developments are looked forward to with much interest.

Oro Fino.—This mine continues to look unusually well, and the South Chariot mill is kept constantly employed on the ore. Superintendent Catalow has great faith in the paying prospects of the mine, which will soon become remunerative on its own merits and yield a handsome return to the company whose liberal expenditures have made the work the subject of general admiration.

Elmira.—Operations will soon be temporarily suspended in order to give the owners an opportunity to make preparations for a fall and winter campaign by the erection of new buildings, etc. There are about thirty tons of ore on the outside of the mine, the crushing of which will commence next week at the Leonard mill.

Wagontown Mines.—From the Wagontown mines the reports of operations are unusually encouraging. In the Harkins claim a rich strike was made yesterday in that part of the mine known as the "Dead Beet." The ledge at this point is of the talc formation and carries some streaks of gold. This is rather an uncommon development in these parts, and is quite promising. Some rich rock has been taken out of the Henrietta recently. In the cross-cut from the main shaft where the ledge is being divided, the seams develop some very fine ore. Mays & St. Clair are doing a tip-top business on their claim. They have been stoping for several weeks past and have now 150 tons of ore on the outside. Much of it is first-class and very rich. The ledge is seven feet wide at the bottom of the shaft and all solid ore. The shaft is down 55 ft in the Webfoot, and everything is looking quite promising in this claim.

Gas Fixtures.

We made a visit one day this week to the new establishment of Mr. Thomas Day, Nos. 122 and 124 Sutter street, and came away with the impression that it was as handsome a store as there is in San Francisco. Just imagine one large lofty room, fifty by one hundred and twenty feet, with an immense collection of chandeliers pendent from the ceiling, and the walls covered with brackets, curiously colored shades, bronzes, elegant fixtures, and all the miscellaneous varieties of a first class gas fitter's establishment. There is a perfect forest of chandeliers of more than imaginable variety of design, varying in price from a few dollars up to $550 each. All these are hung from the ceiling in such a manner as to be critically examined, and the combination of colors and designs makes the display a highly ornamental one.

This firm was established in San Francisco before gas was introduced, and imported the first lamp posts ever brought to the city. The new and elegant store in which business is done was opened about a month since, and is without doubt one of the most elegant in the city. Two floors are occupied. The main show room is 50x120 feet. A room in one side of this where plumber's materials are kept, is 40x40. The basement covers about the same space as the main room, and is used for heavy goods.

The business is quite an extensive one, and the variety of goods dealt in is great. The stock of chandeliers is handsome, and the designs are of all characters and dimensions. The heavy crystal chandeliers are from France and England, but the bronze ones are mostly from New York and Philadelphia. About one-quarter of the main show room is divided off by a railing, and neatly carpeted. Within this enclosure are kept the more ornamental and costly goods. Every inch of space is utilized, and one can imagine the variety of the stock when it is stated that of all the chandeliers exhibited no two are of the same pattern, each being only a sample of those on hand, so that the whole forms the largest stock on the coast.

The bronze clocks and fancy articles are of elegant designs. A plentiful supply of articles of this kind is kept on hand. Most of the bronzes are imported from France. A large supply of photographs of bronzes is kept for the convenience of purchasers, so that people who desire it may select any that can be had in Paris. Mr. Day thinks that he is better able to meet every call than the largest houses in New York. He has an agent in Paris, who selects for him and keeps him posted on all the new designs. The New York men make occasional visits to Paris to select what they want, but carry only a small stock, and make no use of the photographs. Many of these bronzes are most elegant things. The subjects are chosen by persons of taste, and real artists attend to the execution. Some of the pieces are sold at $500. Many of them are arranged so as to be used as gas fixtures or not, as desired. Imitation and real bronzes both are kept on hand.

The marble and bronze clocks are very handsome and made in various designs. Around the shelves in part of the main sales room are arranged a great variety of handsome and elegant gas shades. It is only lately that colored shades have been imported here, but now any one can match their furniture with shades of similar color. The richest of these shades are of French manufacture, but the best hand painted shades for drop lights are American, they being made better in this country than elsewhere. Some of these are really beautiful works of art, skilfully executed.

With chandeliers and gas fixtures so many different kinds are kept that they seldom make them to order. In this line they are as well supplied as any house in the United States with choice designs. They have taken great pains to make proper selections, and as they are bound to no one manufacturer, but trade with all or any, they can select what is desirable from each. Side brackets, hall lights, etc., are kept to match the chandeliers, in bronze, plate, orystal, gilt or steel.

A large supply of plumbers' and gas fitters' goods are kept and this house supplies most of the plumbers and gas fitters here. A large stock of brass goods is kept and iron fittings, iron pipes and everything of that character. A curious thing they have is the enameled bath tub, made of iron enameled inside and as smooth as glass. They have also the same style of wash basins, stands, etc.; copper bath tubs and boilers may also be seen. They have several styles of cabinet stands with wash basin and hot and cold water for bedrooms, etc., making an elegant piece of furniture out of the wash stand. These are made of walnut and maple, with marble tops. The supply of plumbers goods is very varied and the articles too numerous to mention.

One would hardly imagine there was so many kinds of gas stoves until examining those in this store. Some of the little nickle plated ones are very handsome. They also have a variety of gas-log stoves similar to the one exhibited at the Fair. These are made to resemble a pile of logs on a fire place, and the little jets of gas, when lighted, give the wood the appearence of burning. The "wood" is made of asbestos and other indestructible material and will last a lifetime. It is no trouble to make such a fire any time. Quite an assortment of fountain jets is kept on hand, as well as a number of German student lamps and other articles of a miscellaneous character.

New Style Ore Pulverizer.

In the extreme rear end of the Mechanics' Institute Pavilion in the Machinery Department is a queer looking piece of machinery which, when in motion, moves back and forth four heavy pieces of iron which set in a box filled with water. People stop and look and wonder what it is for, as they do at many other articles with which they are not familiar.

It is called Moyce's Ore Pulverizer, and is intended for crushing, or rather grinding, ore. the machinery is of rather peculiar construction and entirely different from any ore pulverizer previously in use. There are four heavy grinders, placed side by side, which are moved back and forth on a bed by means of eccentrics on the shaft. The grinders or pulverizers weigh about 800 or 1000 pounds each. The shoes with which they are shod may be removed like ordinary stamp shoes, as can the dies in the bottom of the iron box in which the grinders operate. These heavy grinders, as they move back and forth, have a peculiar rocking motion which is communicated by the eccentrics, so that the ore is stirred up and brought under the shoes at each backward and forward movement.

The idea of the machine is to get the benefit of the arastra-like grinding, but in a more rapid manner. All mill men know that there is nothing yet invented that will come up to the old-fashioned Mexican arastra for crushing rock fine and working gold ores up to a high percentage of the assay value. The only trouble is that it is too slow in its operation. This machine grinds the ore in the same manner, except that the drags move backward and forward instead of in a circle as in the case of the arastra. The rolling motion which is communicated to these grinders has the effect of bringing a new batch of ore under them at each move. The shoes are slightly rounded to aid this, so that the ore does not pack at each end of the dies as it would with a flat shoe.

The ore is first broken up by a small rock breaker and then fed into the pulverizer through a hopper. Being ground up fine the ore is amalgamated as soon as it leaves the pulverizer. A five-horse power engine is required to run this machine, rock breaker and all. The whole mill can be made in sections, so as to be packed on mule back in mountainous countries. There is no complicated machinery to get out of order and no heavy frames to set up before the mill can be put in motion. The space occupied is very small, the mill being low and compact. A mill of this kind, rock breakers, engines, pumps and all, could be put up at a comparatively small cost. The one to which we refer is calculated to grind half a ton of ore per hour, or about twelve tons per day, which is greatly in excess of the capacity of three or four ordinary arastras. These machines are made at the Pacific iron works, in this city, and are mainly intended for prospecting mills, although adapted for heavy work where necessary.

Progress in the Sutro Tunnel.

The following is the report of progress in the Sutro tunnel, for week ending Sept. 8, 1875:

Number of feet in tunnel, August 29	10,666
Number of feet driven during week	101
Distance in, September 8,	10,767

Details of work performed are as follows, heading being 8x10 feet:

Holes drilled	313
Holes blasted	316
Aggregate depth	2,191 feet
Average depth	6.902 feet
Powder consumed	648 lbs
Exploders consumed	316
Rock extracted	1,322 tons

Water.—Quantity, 46 miners' inches. Temperature—at mouth, 76 degrees; at shaft No. 1, 79 degrees; at shaft No. 2, 79 degrees; at header, 83 degrees.

Air.—Temperature—at mouth, 79 degrees; at shaft No. 1, E. 78 degrees, W. 73; at shaft No. 2, E. 80 degrees, W. 81; at header, 84 degrees.

Remarks.—Ground—fair drilling and good blasting, consisting of a mixture of quartz and porphyry.

The Fryer Works. — The Grass Valley *Union* of Sept. 15th says: We visited this establishment yesterday, in company with Mr. Fryer and his partner, Mr. Hall, who has just arrived from New York, and found a force of workmen busily engaged in setting up the big boiler, which is one of the main features in working by the new process. Beside this all the cast iron "sections" are on the ground ready to be put in place. Every exertion is being made to put the works in order for the regular working of ores in quantity, and it is expected this result will be attained in about three weeks. Convenience as well as neatness has been studied in the arrangement of various parts of the establishment, which strikes the eye pleasantly, and carries the impression that the proprietors have all confidence in the success and permanency of their enterprise. Until the present enlarged works are completed nothing will be done in the way of working ores, but we can say that recent tests of different ores with the small apparatus which has been used give the most satisfactory results in every instance, whether they be free milling or the noted rebellious ores of Meadow Lake district.

The New Railway Tunnel.

Ths work on the tunnel of the Delaware, Lackawanna and Western railroad oompany, under Jersey City heights is being pushed forward with remarkahle rapidity, consideriug the extent of the work aud the many obstacles met with. In the construction of the great Heosad tunnel, which necessitated an outlay of many millions of dollers, the engineers met with many difficulties, hut they found about as much soft as hard rock; but in the Delaware and Lackawanna tunnel there is nothing hut solid trap rock. The labor of piercing this has already cost large amounts of money, the finest and most powerful drills being nsed day and night. Masons are now employed in arching the eastern entrence facing Hohoken, and it is expected that some time next week the immense keystone and tablet will he placed in position, after which, the work of laying the copings will be commenced. The stone used for this portion of the masonry will he highly polished, and the names of the Delaware, Leckawanna and Western railroad, and the Morris and Essex railroad, the date of the commencement of the work, name of the engineers and those of the President, Board of Directors, and the contractor will he engraved upon it. The stone is a singularly beautiful specimen of blue granite of immense size. The masonry at the western entrance is not quite so far advanced, operations at this point not having been begun until a year after the shafts had been hegun in the eastern extremity. Ths tunnel when completed, will he 5,000 feet in length, twenty-eight feet in b'ght, and twenty-four feet in width, and will have involved an outlay of $2,000,000. The entire distance thus far excavated from the eastern entrence is a little over 1,100 feet, about one-fifth of the whole distance.

It is anticipated that hefore the middle of next month shaft No. 3, which is 2,500 feet from the mouth, will be reached. Eight hundred meu, all told, are employed, of which two gangs are engaged day and night in six shafts. A large force is now employed in tearing away the rock at the western end, and having succeeded in piercing to within forty feet of shaft No. 6, which is distent about 500 feet from the entrance. The seamy nature of the rock at this point will make it necessery to bnild about one thousand feet of solid masonry, which will require ahout three millions of bricks. Four general hlasts a day, in tbe two headings and the various sbafts, ere reqired, and the average number of mines exploded each time throughout the tuunel is thirty-two. These are set off at uiue o'clock in the morning, at noon aud at four and six o'clock in the afternoon. The hroken stone teken from the interior is used in making a high embankment, extending about 2,000 feet towerd Hoboken. One hundred and fifty cars are required to carry the stone from the tuunel, and in addition to masons, carpenters and ordinary workmen, thirty-two engineers and as many blacksmiths are coustantly employed. Yestsrday the masons hegan work on shaft No. 1, and will finish the others in quick succession. Everythiug connected with this groat work, except the operations of the engineers, has been done under the direct supervision of Mr. Johu McAndrews, the contractor, who has already hnilt many hridges along the line of the road, besides sinking e number of coal shafts at Screnton. Mr. McAndrews is confident that everything will be in readiness for running the traius hy the middle of July next. The ship canal at Hoboken, on both eides of which large warehouses will be built, will he completed in the fall, and will constitute another great accessory of the tsrminus of the road.—*N. Y. Times.*

Art Education for Mechanics.

Tbe idea of making educetion more practicel seems to have at last reached tbose who have charge of our public schools, and good results are likely to follow. Attention has been directed to the primary departments, end it is conceded that the hest teechers should he furnishod to the younger pupils, and every facility afforded for their advancement. The ornamental part of an educetiou is well enough for those who have sufficient time to pursue it, but the majority of scholars are thrown out into life to begin their work at the ege of fourteen. Whatever education they are to acquire at the public expense, must be gained before that time, end as they are to he self-dependent, it must be conceded that it ehould be ae practical as it is possible. There is a demand in the country for ekilled lebor, but there is uo call for business and professional men, nor yet for those who are ready to teke "anything not menial," meaning any occupation that does not call for the labor of their hands. It was far better that the boy who has his own way to make in life should have a trade at his hack, thau be coutent with merely an ornamental education. His skill in labor will not prevent bie making a fortune in business, or following any other calling. And he has the advantage of heing able at any time to fall hack upon his trade, of which uo reverse can deprive him. The mechanic and his trade, ouce united, are forever inseperable, and industry with skill ie the sure road to prosperity. But the progress of our manufacturing industries demand the highest type of skilled labor, for which we have hitherto lookod largely to Europoan countries. If we would create it in our midst, we need art schools and technological colleges. Help along the drawing in our public schools.

Circular Saws for Re-sawing.

To say there has been a struggle in attempting to re-saw lumher with circular saws, would be but a mild description of the time, expense and effort that hes been devoted to this object. The incentive has, of course, heen the greater speed at which sawing is executed with circular saws. In America, where the gang re-sawing machine has not yet come into nse, and where re-sawing is confined mainly to splitting thin hoards from planks, the circular re-sawing machines have heen qnite successful, and are in general nse for tho nerrower varietiss of lumber, and in some cases of the deepest stuff. One firm expended a great deal of money and time in an experimental way attempting to split deep lumher with the circular saw, and have certainly heen successful in the kind of re-sawing to which their experiments were more espccially directed, splitting one-inch hoards; 15,000 to 20,000 feet a day are sawed on a single machine. The re-sawing circular saw consists of a central disc of wrought iron, about sixty iuches diameter, turned very true; on the periphery is attached segmental plates, as in a veneer sawiug machine, of ahout sixteen geuge at the teeth. The disc and saws are beveled off from the center to the periphery, the lnmber springing off on one side to pass the eye of the saw, which is perhaps one inch in thickness. The feed is by means of rollers, expansively geared and acting in concert with the saw spindle, from which they are driven.

We notice this machine at this length for the reason that no other of similar proportions has been attempted in America. Splitting saws with power feed are, as before stated, in general use for splitting "siding," or weather hoarding, and other lumber to ten or twelve inches wide; and if such machines were as carefully and accurately made as sawing machines are in England, and the packing hoxes aud guides adopted, saws of fourteen to eighteen gauge could no doubt be successfully worked in lumber to sixteen and eighteen inches deep.

Re-sawing is quite a different thing in England from what it is America, not only with respect to the nature of the lumber, whieh has so much to do with tho nature of the machines for splitting it. A machine to work lumber eight inches deep or twelve inches wide is, in the English market, considerod as adapted to general uses. On the contrary, in America re-sewing machines to have the same range of adaptetion, must split thirty inches desp, and plening machinee are rarely made with a less width thau twenty-fonr inches. Machinery to work lumber from the Wabash valley aud in other parts of the Middle States, in America, must have a maximum width of thirty-eix inches; end even at this, boards and planks sometimes require to be split in order to ho worked. The advantages, however, of working lumber of this width for any use is questionahle, and the only advantege is thet less is wested in suh-dividing wide than narrow hoards. —*Richard's Wood-working Machines.*

Lac.

There is certainly no more curiously interesting article of Indian export than lac, whether in the form of a heautiful dye or in that of a certain secretion elaborated hy a husy little insect called the *Cocus lacca*, the derivation of the latter word evidently coming from the Sanscrit *laksha*, signifying 100,000 and owing its origin to the fact of so great a mnltitude of tiny workers heing engaged in manipulating the secretions which issue from punctures made in the twigs of certain smooth harked trees, euch as the peepnl, kossum, byar, hanyan and prass.

Among the Hindoos lac is of immemorial renown, aud is to be found throughout India, Siam, Burmah and Assam; that produced in Siam, fetching the highest price in the home market. After "swarming," the insects atteoh themselves to a young green hranch, and from its sap, modified hy their own action and properties, a resinous coating is formed and divided into minute chambers, whicb eventually hecome a cradle for baby *Cocus lacca*, a tomb for the parent, and the stick-lac of commerce. The bodies of the insects possese the dye, with which also the whole inside of the coating is impregnated. As the eggs are hatched, the young lahorers work their way through the walls of the shells and appear in myriads, so that the side of operations appeers to he covered with living vermillion. There are five descriptione of the article—stick-lac, eeed-lac, lump-lec, shell-lac aud hutton-lac. The first is the exudation *pur et simple*, and resembles dirty coral; of this a eingle tree usually yields from thirty to forty pounds. Seed-lac is the sems, hut in a granulated form and deprived of coloring matter. To accomplish the seperation it is necessary that the wood be carefnlly divided from the lac, an operation performed by passing a roller repidly over the twigs, when the coating comes off. The resinous residue is then freed of all impnrities, slightly bruised, washed in cold water, and finally steeped in hot water to kill the original manufacturere. The colored fluid is now strained off, and the grannlated particles are dried. Lump-lac is seed-lac in a consolidated form, and is prodnced by constant kneading. To ohtain shell-lac, seed lac is strained through coarse cotton hags placed near charcoal fires to admit of the coutents molting. Tho resin comes out in a form of thin flakee, which ie shell-lac, while the rougher portion, from its eimilarity to that artiole, receivee the term "button."

The dye is obtained during the procees of prepering ssed-lac, and is precipitated from an alkaline lixivium by the agency of alnm. Ths coloring matter is thsn vatted, filtered on tables, and pressed in boxes like indigo, appearing in the market in small thin cakes.

In India, lac, in whatever form, is used for many purposes—for trinkets, such as earrings, necklaces, bracelets, and numherless other ornaments which find ready purchasers in the hazars; in the manufacture of ink, and as a basis of sealing-wax. The beautiful specimsns of lecqnerware, from Scinde, which took a prize at the exhibition of 1851, owed their heanty to lac; and in Burmah it is also used by jewelers for coloring gold, and a cement where with to bind metal work. Large quantities are produced in the Shan States, and it is the desirs of the Government to introduce regular lac preserves iato British Burnmah. The insects ere removed from one tree to another, and even long distences, with the greatest ease.—*Chemist and Druggist.*

The Newport Coal Company.

Another one of the compauies organized to furnish oheep coal on a co-operetive plan is the Newport coal company, which exhibits some of the product of the mine at the Pavilion. The mine is one of the oldest coal mines on the coast. They shipped coal from it to thie city as early as 1855. The company now owning it has just heen incorporated, with a capital stock of $4,000,000, in 40,000 shares. Tbe company offers 10,000 shares of its stock for sale, the first 10,000 being offered at $50 per share, $10 down, the balance in monthly installments of $5 each. The holder of each share of this stock is entitled to purchase half a ton of screened coal monthly, at the rate of $8 per ton, from the vessel alongside the wharf, or from the yard; sacking, wharfage, drayage, etc., beiug added. This right hegins on the first payment heing made. The mine is ou Coal Bank slough, Cocs bay, Oregon, forty hours by steem from this city. The proprietors have been shipping coal here for twenty years, and the ooal is well known. It is claimed to he the cleanest of our domestic ooals, hnrning with a bright flame, and is free from smell; when the draft is shut off it smoulders slowly, enabling the user to maintain the fire for a long period with a small consumption of fuel, a great recommendation for domestic uses. The seam of coal which tbe company is now mining is said to contain over 6,000,000 tons of available materiel, and the ground is prohably nnderlaid with two seams, as yet untouched.

From the way in which the ooal liee the company do not require hoisting or pumping works, nor will they for many years, as a very large body of the coal lies ahove tho water level of the mine, and can be extracted through the main gangway or tunnel, which penetrates the ooal for more than 2,000 feet.

The former owners have done nearly all the dead work of the mine, so that the company succeeds to a property already in a position to furnish 200 tons a day. The company has snhstantial bnnkers et the mine, capable of holding 2,000 tons; a good tramway to deep water; locomotives and cars capahle of loading 200 tons in six hours; good houses for the officere of the company and its employees; blacksmith shop, horses, mules, stables, barn, boarding honse, orchards, water, etc., so that unless the production he very largely increased there need be no great outlay for extra improvements.

The directors of the company are: Jas. R. Kelley (President); S. S. Manns (Secretary), Jas. Flanagan, Patrick Flenagan and Felix Chappellet: The compauy's offices are 118 and 120 Market street, and at Chappellet & Miners', Oakland. The coal may be examined at the Pavilion.

Building Societies in England and Wales.

There are 2,000 building societies in England and Walos, with a membership of 800,000, a snbscribed capital of over £9,000,000, a loan and deposit capital of over £6,000,000, total assets to the amount of £17,000,000, mortgage advances over £16,000,000, and a yearly income of more than £11,000,000. One society has nearly 17,000 members, and another 10,000. The income of a single society is over a million and a half pounds. So great is the confidence of the puhlic in these enterprises, that many of them have reduced the rate of interest to four, and even three per cent., in order to check the influx of depoeite which still come flowing in. Though the societies frequently loen large amounts on the security of mills and factories, yet they meinly do business with the working classes or with a class slightly euperior to them in station. In the northern counties they have proved of great service to the working classes, hy encouraging the conetruction of small honses, thereby keeping the rents of that clase of dwellings at a moderate sum.—*Ex.*

Woonen Shoe Manufactory.—E. W. Shipper, of Meadville, Pa., has commenced tle manufacture of wooden shoes. His mechinery, mostly the result of his own mechanical ingenuity, is cepahle of turuing ont hundreds of peirs a day. This is the first factory of the kind in this country. It is thoug ıt such shoes will be suitable for fermers and others when working iu the wet. They might aleo he suitable for miners.

Rochester Flour.—Rochester, N. Y., claims to produce more flonr to-day than ever ehe did before, and more of the higher gradee than any other city of the United Statee. Six hundred coopers find employment in making barrels for the flour manufactursd there.

Edge Tools.

Little more than a ysar ago Mr. W. F. Palmer, in connection with another gentleman, fitted np a factory on Berry street, between Fourth and Fifth, for ths manufactnre of sdged tools. As the capital at the command of these gentlemen was limited, thsy, of necessity, relied for their success on the labor of their hands. When but a few montbs had passed, their husiness met with a serious check by the sudden death of Mr. Palmer's pertner. This misfortune subjected their mutnal property to the usual legal process, and, as a consequsnce, greatly retarded the progress of the business.

Mr. Palmer, however, resolved to push the business forward by hie own exertions, and, with only one helper in his factory, toiled on day after day, determined to show the mechanics of San Francisco that he oould furnish them with tools that would claim their patronage by their excellence and durability. Many of them were, however, slow to understand why they should pay a higher price for the tools he manufactured than apparently the same kind of tool of Eastern make. But when a few had been convinced that the best was the cheapest, even though at a greater expense, the word soon passed from mouth to mouth, that W. F. Palmer was manufacturiug a snperior implement, and it was not long until the merit of his tools had secured him a living patronage.

Altbough his manufactnring facilities are yet limited, the reputation that his wares have secured to him has placed his business on a substantial basis, and with the rapidly increasing demand, will provide the means for extending thess facilities He confines himself principally to the manufacture of ship carpentsrs', house carpenters', millwrights' and butchers' tools. His experience in this line is large, having been engaged in the same busines for a number of years in the Atlantic States. It is a common saying among wood workers, that "any tool that will etand the work in sbip building will stand anything." Allowing this to be true, (and it certainly is a good test,) Mr. Palmer, no doubt, takes great satisfactiou in viewing the long list of names of San Francisco mechanics which he has, that attest the superiority of the work he turns out. When it was generally nnderstood that a Mechanics' Fair was to be held this season, Mr. Palmer hegan preparation for an exhibition that would he hoth attractive and instructive. Ae a result of his labor, in this direotion, we would refer the visitor to his stand at the west wall of the Pavilion, abont midway, where he makes a fine display of the kind of tools he manufactures. That these are entirely of home manufacture, the samples that are here seen in the differeut stages of perfeotion—from the crude iron up to the finished tool—is evidence.

How They Drop Shot.

A reporter of the Baltimore *American* thns describes one of the many processes of making ehot in one of the shot-towers of that city: One of the "secrets" of the mannfacture is the mixing of the lead, with a certain proportion of a combination of mineral subtances called "temper." The temper is fused with the lead, and gives the molten metal that oonsistency which makes it drop, and withont which the lead wonld be moulded by the sieve, and would form little penoile instead of round shot. When "BB" ehot, for instance, are to be made, the lead is poured into a pan perforated with holes corresponding to that size. The little pellets come ponring down in a continnous shower, aud fall into a tank filled with water on the grouud floor. In their descent of two hundred feet they become perfect spheres, firm and dense, and they are tolerable cool when they strike the water, although the swift concussions make the tank foam and bnhble as if the water was hoiling furiously. The shot must fall in tbe water, for if they ehonld strike any firm substance they would he flattoned and knocked out of shape. To get the little pellets perfectly dry after they have beeu in the "well," is the most difficult and troublesome process of the whole manufectnre. An elevator with small buckete (very much like those used in flour mills) carries the shot up as fest as they reach the bottom of the well, and dehosits them in a box 60 feet above the firet floor. The water drips from the buckets es they go up, and not much is poured into the receiver above, although it is intended to be a sort of dripping machine. From this receiver the shot runs down a spout into a drying pan, which greatly resembles a gigantic shoe, made of sheet iron.

The pan rests at an angle which permits the wet ehot to roll slowly down to the chamber helow, and the pellets become perfectly dry as they pass over the warm sheet-iron.

Alumnium.—According to Winkler there are at preseut four alumnium mannfactories, which produce 35 cwt. per annum. Of this quantity 20 cwt. goes to France and 15 to England. Alumnium is also made in Berlin. The price for a numher of years hae heen $12 to $15 per pound. It is not probable that it will he produced cheaper than that. This fact, with its nnchangeability and lightness, being three times lighter than oopper, four times lighter thau silver, and seven or eight times lighter than gold, render it excellently adapted to coin, especially as it is easily coined.

The Ticonderoga farmers have converted their church into a cheese factory and thsir race course into a cow pasture.

Useful Information.

Snakes in Ireland and Irish Oak.

Everybody has heard the old legand concerning the driving out of snakes from Ireland by St. Patrick. While making a tour of the island some years since, we inquired of many of the natives as to the existence of snakes, and the invariable reply was that they were rarely, if ever, met with. Reptiles, a few inches in length, are sometimes found, but they rather resemble worms than snakes, and it is a question if the Irish peasant really knows what a snake is. There certainly seems to be some reason for believing that Irish earth possesses peculiar properties antagonistic to reptiles. It now appears from a statement in *Land and Water* that Irish timber has a quality somewhat akin to that which distinguishes the earth it springs from, in that it will never harbor spider or cobweb. The ceiling of the nave of St. David's cathedral, in London, is constructed of that material, and cobwebs, it is said, are never seen there, though ite excellent carving might well form a groundwork for the spider's ingenuity. It does not appear for what reason Irish timber was imported into England, where the oak was formerly so plentiful, but it may possibly be due to some superiority in quality. The curious recumbent figure of Robert, Duke of Normandy, in one of the side chapels of Gloucester cathedral, is said to be carved out of a single piece of Irish oak, which gives promise of proving as durable as bronze, which it somewhat resembles.

Buttons from Pebbles.—Immense quantities of buttons, manufactured from pebbles, are produced in Parie, and sent to almost every part of the globe. These pebbles, which are of crystalized felspar, containing as little clay and lime or lime salts as possible, are reduced to powder by heating them to cherry red ond then plunging them into cold water. The powder is separated from its impurities by being passed through a wire gauze sieve, and is next well stirred in water. The residuum is treated with a quantity of hydro chloric acid, varying from three to ten per cent., to free it from the oxide of iron, which would give the buttons a reddish tinge in the baking process. One hundred pounds of powder are mixed with two of chloride of sodium and four of floar paste, dissolved in five quarts of water; the whole is then passed through the sieve, and dried to a proper consistency for moulding.

Water Supply Works. — The first waterworks in the United States were planed and constructed by Mr. John Christopher Christenaen, at Bethlehem, Pa., in 1762. The machinery consisted of three single-acting force pumps, of four inch calibre and eighteen inch stroke, and worked by a triple crank, and geared to the shaft of an under-shot water wheel, eighteen feet in diameter, and two feet clear in the buckets. The water was raised by this machinery to the hight of seventy feet, and subsequeotly to 114 feet. The works were in operation as late as 1832. The first rising main was made of gum-wood, as far as it was subject to great pressure, and the rest was of pitch-pine. In 1789 leaden pipes were substituted, and in 1813 they were changed for iron.

Asphalte for Paths and Roadways.—Let the gravel or limestone chips be passed through a three-fourth inch riddle. Pour coal tar over the gravel or scraps, and well mix just enough to blacken them. Lay on the path three inches of gravel riddled through one and one-half inch riddle, and spread it evenly; over this layer spread one inch of the finer kind, levelling with a straight edge. Then roll it with a heavy roller three or four times. If the asphalte adheres to roller, water and sand it with coarse river sand, and roll again until it becomes consolidated. When dry a dressing of hot tar may be given it, dry sand being dusted over it. Sand it until the surface be thoroughly hard.

Chinese Bronzes.—A chemical examination of some Chinese and Japanese bronzes of unusually deep color, exhibited in Paris in 1869, has shown the existance of a much larger percentage of lead than occurs in the ordinary bronzes, proving that it is to this substance that the special composition and color of the brouzes is due. Where zinc was present in considerable quantity, it seemed rather to counterbalance the effect of the lead.. An alloy composed of five parts tin, seventy-three of copper, ten of lead and two of zinc, proved to be exactly like the Chinese bronze, and identical with it in fracture and polish.

American Oil in Japan.—The consumption of petroleum in Japan is very large, and shiploade are received from America. Japan, however, possesses naptha springs in her own territory, and some time since Ischieaka Schujo was sent to Pennsylvania to obtain information relating to the process of production and preparation. His son is still in the States purchasing the necessary machines and perfecting his studies of the subject.

Clay Pipes.—Over 1,000,000 clay pipes are imported into this country annually, the greater number being the celebrated "T. D." brand. All these pipes are made in Glasgow, Scotland, and chiefly by one firm, W. White & Sons, honest old quakers, a house that has existed for nearly a century and a half.

Snake Skin Shoes.—We saw last Saturday, says the Winchester (Tenn.) *Journal*, a nice pair of No. 4 shoes, the vamps of which were made of rattlesnake hide, and the quarters of chicken-snake hide. Also several snake hides neatly tanned, and three feet long and eight inches wide. They belonged to J. H. Henderson, who lives on "Big Coon," in Jackson county, Ala. He makes a specialty of catching all kinds of snakes, rattlesnakes in particular, and, without injuring or killing them, proceeds to take off their hides. These he tans in about two months, and then makes them into shoes, slippers, etc. He uses a weed which grows on the mountain, to mesmerize the snakes. He says they will readily become harmless under the influence of the weed, which he fastens to the end of a long stick, and, rubbing it for awhile about the snake's head, soon has it insensible, and then he ties it preparatory to skinning it.

Utilizing Sawdust.—Sawdust can be converted into a liquid wood, and afterwards into a solid, flexible, and almost indestructible mass, which, when incorporated with animal matter, rolled, and dried, can be used for the most delicate impressions, as well as the formation of solid and durable articles, in the following manner: Immerse the dust of any kind of wood in diluted salphuric acid, sufficiantly strong to affect the fibers, for some days; the finer parts are then passed through a sieve, well stirred, and allowed to settle. Drain the liquid from the sediment, and mix the latter with a proportionate quantity of animal offal, similar to that used for glue. Roll the mass, pack it in molds, and allow it to dry.

Fern Leaf Ornaments.— Handsome ornaments can be made by mounting fern leaves on glass. The leaves must first be dyed or colored They are then arranged on the mirror according to fancy. A butterfly or two may be added. Then a sheet of clear glass of the same size is placed on top, and the two sheets secured together at the edges and placed in a frame.

Steamboat Power.—A Massachusetts man, wanting power for his mill, which is on the river side, has hired an idle steamboat, backed it up to the proper position, and taking off the paddle wheel, bolted the steamer fast, and it furnishes him all the power he wants.

Recently two inkstands and a pen were dug up at Pompeii. The pen is of metal, and made almost similar in shape to our quill pens.

The British Admirality have ordered a hundred of Captain Boynton's water dresses for coast-guard service. They will cost $60 each.

Good Health.

Death in the Nursing Bottle.

The *Scientific American* furnishes a very timely and truthful article on present extended use of the india rubber tube and mouth piece, connected with the nursing bottle. It holds that a prolific source of the present alarming infant mortality in New York (about 800 a week) is traceable to this cause. That journal says: We might write a column on the dangers that reside in the milk, unless special care has been taken to obtain it fresh or by suitably diluting pure condensed milk. But this danger is well known, and our business at present is with the bottle, or rather its dirty tubs, which should never be used more than once, then thrown away and a new one bought.

Even when new, these white tubee, impregnated as they are with oxide of zinc, are not unobjectionable; far worse are they when saturated with sour milk, germs of putrefaction, decay and disease. Some of these child-murdering Yankee inventions have reached Berlin, and have called forth the following from a practicing physician of that city:

"The supposed advantage of these bottles consists in this, that they can be placed beside the infant in bed, while other bottles must be held in the hand all the time. What sensible mother or nurse would leave a child with a bottle without watching it? The danger of the bottle consists in this, that it is absolutely impossible to cleanse it. When sucked on, little particles of milk become attached to the tube and cork; these curdle and soon turn sour. If some of this deposit be placed under the microscope, we see innumerable bacterio, organic beings which indicate decomposition and decay. At every meal the child draws in thousands of these germs. The decomposing process acts upon what it finds in the mouth, œsophagus, and stomach; and the result is diarrhea, *cholera infantum*, etc. I will here expressly remark that the usual method of placing the apparatus in water, or merely rinsing it out with a stream of water, is in no way sufficient. Some dealers sell a suitable little wire brush with the bottle, but even this does not answer the purpose, for the apparatus is not clean by a long way after drawing the brush through it several times; and who will take the trouble to clean it so thoroughly eight or ten times a day? How much time it would require! Another disadvantage is that the bottle is air-tight, and a partial vacuum is formed, which renders sucking so difficult as to exhaust the child, and it stops before its hunger is satisfied. Hence, parents, you who are compelled to feed your children with a bottle, throw away this apparatus, which can only bring destruction upon your children, and either select a bottle with glass mouthpiece, which is filled from below, or take a large rubber mouthpiece, which is perforated by a small hole and can be drawn directly over the neck of the glass bottle. This large mouthpiece or nipple can readily be turned inside out and thoroughly cleaned and rubbed with dry salt."

Causes of the Decay of Teeth.

In a paper read before the American Dental Society of Europe, Dr. George W. Field says: "By analysis, healthy blood is found to contain a small percentage of inorganic matter, and we can but infer that it is there for a purpose, and that purpose the building up and supporting a perfect osseous system, and that it is from this source alone that the teeth can derive the materials essential to the proper development of their different parts. The blood, acting as medium to supply these materials, cannot manufacture them, but must be supplied most generously, and the food taken into the system must be the base for supplies. Then it follows that the food richest in phosphates is what we need. In the preparation of wheat flour the most valuable part is rejected —that which contains the very nutriment for the want of which we are losing our teeth. The animals fare better than we. The Scotch oatmeal is still richer in phosphates than wheat, be the latter ever so properly prepared; therefore, to substitute this for the fine wheat flour is what is essential if we wish to have such teeth as nature designed we should. These are my convictions, and they are strengthened daily.

I have had opportunity to examine the mouths of people of almost every nationality, and I have found none that could be compared with those from the north of Iraland and of Scotland. These people make the use of oat meal as a principal article of food. They tell me that it is an almost universal brenkfast dish, in the form of porridge, with milk, especially for the young. In many families it is served in cake form for supper. This is a national dish. All partake of it, old and young; and it is with the latter, during the period when all the developmental forces are active, that the system thus nourished is the most benefited These people not only have a good dental development, but they are strong and healthy, possessing a strength and vigor of constitution almost unknown elsewhere. Acknowledge that nature must find in the food the material out of which to build up a strong and vigorous constitution; how can we expect to have teeth other than of the delicate, fragile sort, easily acted upon by the deleterious agents present in the mouth, if we persist in withholding the very elements required for their proper nourishment and development?

We all know that, during the period of growth and development, if there is an unusual deficiency of the bone-producing elements, if, because of a severe illness, there is a suspension or a weakening of the assimilative power of the system, this temporary arrest of the developing process in the growth leaves its ineffaceable mark, and nowhere so conspicuous as upon the teeth. This being the case, is it unreasonable to suppose that, given the ordinarily good health, and a activity of the developmental forces of children, and a generous supply of the proper bone food, we will have as a result a good dental development?"

Hygiene in the Sick Room.

This subject is admirably summed up in the following extract from "Cameron's Manual":

The atmosphere of a room in which a patient lies cannot be subjected to the influence of such disinfectants as sulphurous acid or chlorine. Abundance of fresh air should be admitted—in fact, too much attention could hardly be paid to the ventilation of the apartment—and it should be provided with a fire-place. The larger the room is, the better for both patient and attendants. Light should, unless under very peculiar circumstances, be freely admitted. Solution of chloralum or permanganate of potassium should be placed in large saucers. The dejecta and saliva of the patient should be instantly covered with a strong solution of bluestone, chloralum, or a weak solution of chloride of lime, and they should be speedily conveyed from the room. Slops of any kind ought to be promptly removed. The less furniture (consistent with comfort) the room contains the better. Window and bed curtains, carpets, and tablecloths should not be tolerated. The linen which has been removed from the patient is best placed in a tub containing chloride of lime solution. In a house where there are several inmates, it is well to hang a sheet moistened with chloralum, etc., outside the door of the sick room. Instead of handkerchiefs, the patient might use rags, and these after use should be placed in a basin and covered with disinfecting solution. The attendants should not place themselves in such a way that the air entering the apartment would pass from them towards the patient. The less communication held between the inmates of the sick room and those of the other apartments (who are obliged to remain in the house) the better. Should the patient die, the body should be isolated, and interred as speedily as decency admits of.

Domestic Economy.

Horse Flesh as Food.

A Paris correspondent of the St. Louis *Globe* writes as follows: "A great prejudice exists out of France against horse flesh as food. It is sold here in every arrondissement, and is often very palatable. Scientists have pronounced it as nutritious and savory as beef, from which it is not easily distinguishable. To my taste it seems like a mixture of veal and beef. I ate it first a number of years since, and liked it, having confidence in my cook, and in the healthy condition of the meat. The horses that are butchered are horses that have received incurable wounds, have broken their legs or are in some way rendered useless, not, as is frequently affirmed, those that have died of disease or of old age. The authorities look after this with parental solicitude. A horse that had perished from disease could not be disposed of, so vigilant are the police, for gastronomic purposes.

Horse Banquets.

You may remember that the late Geoffrey St. Hilaire, the famous savant, once gave a horse dinner to a number of his friends, all of whom were vastly pleased with it. The noble quadruped was served in every style, from soup to roast and ragout. A few years since an equine banquet took place at the Grand hotel. One hundred and fifty persons, representing the learned professions, and embracing many distinguished men, were at the table, and not one of them failed to approve, palatably, of the repast. The dishes, nearly all horse, were exquisitely cooked under the general supervision of a master of the art, and were described as exceedingly toothsome. I should have been glad to be present. I know I should not have said *neigh* to an invitation, had I been in the city.

After the dinner was over, the director of the entertainment informed the guests that the beasts killed were not young nor fat, but old, lean and worn down by labor; that their ages were from seventeen to twenty-three years. This was a surprise to the partakers, who had accounted for the excellence of the horses by the supposition that they had been carefully selected for their youth, freshness and fatness.

The Consumption of Horse Flesh

Has become commoner than it was when the banquet was given. Nevertheless, it is not very common, nor will it be, because the supply is not likely to be very large. Horses are worth so much more than beef that they cannot be substituted to any extent. They can be made available only when accidents occur. During wars horse flesh is more abundant, naturally, and might be put to excellent use by the Commissary Department. It has been used extensively by the French in Algeria, and will be, doubtless, in the future. A cavalryman should have small fear of hunger when he is, so to speak, on the back of his dinner. It would be a pity to slay so noble a beast as a horse for food; but when he is slain, is it not wise to eat him? As food he serves his distant kinsman, man, as the Darwinians would have it, and serves his kinsman to the last.

Choice Treatment of Foods.

In the choice of foods we cannot exercise too much care. It is cheaper to procure only the very best articles. All vegetables and fruits should be grown on the best soils, and the fertilizers used should be well decomposed and not fresh and rank. Partially decayed food of whatever kind, should be avoided. For breads, the best white wheat is none too good. If grown in new soil it is likely to be better and to contain abundance of the mineral matter so needful to health. Fruits for eating without cooking should be ripe, tender and not too tart; while those for cooking may be either sweet or sour, but they must possess the peculiar quality of retaining when cooked their best flavors. Potatoes should be fresh and ripe—old ones are less wholesome, especially when they have been exposed to the light and air, and bruised by much handling, or long exposed to the cold.

Animal food should be chosen with great caution. Only healthy animals should be used for eating. They should neither be too old nor too young, too fat nor too lean. In butchering, all the blood should be removed from the body, as otherwise the flesh putrefies readily. It should be thoroughly cooled before eating. It is also desirable that the animal be not killed for several hours after eating or after fatigue. The long journeyed animals are sent in crowded, filthy cars, render their flesh unwholesome.

The treatment of animal food is a matter of importance. Why do we cook it at all? First, to render it more pleasing to the sight; second, to develop its best flavors; and third to render it digestible and palatable. Flesh cooked too much is rendered innutritious and indigestible; if cooked too little it is disagreeable eating. Liebig says he would never have flesh subjected to a higher temperature than 170° Fah., except for a few minutes after it is put into the pot, when it may be submitted to a temperature of boiling water in order to coagulate the albumen into a sort of crust on the outside to hold in the flavors that might otherwise be evaporated. In roasting meat, also, let the heat at first be high, and gradually decreased to the boiling point for the same reason. Stewed meats are more wholesome and nutritious than any other. The process renders flesh tender and succulent and easy of digestion.

MINING AND SCIENTIFIC PRESS.

W. B. EWEB.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY, GEO. H. STRONG
W. B. EWER, JNO. L. BOONE

Office, No. 224 Sansome St., S. E. Corner of California St., San Francisco.

Subscription and Advertising Rates:

ADVERTISING RATES.—1 week.	1 month.	3 months.	1 year.
Per line..... .25	.80	$2.00	$5.00
One-half inch.....$1.00	3.00	7.50	24.00
One inch..... 1.50	4.00	12.00	40.0

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper inserted at special rates.

SUBSCRIPTIONS payable in advance—For one year, $4; six months, $2.25; three months, $1.25. Remittances by Registered letters or P. O. orders at our risk

Prompt Subscriptions.

We wish to thank those enbscribers who send in their renewals to the PRESS promptly as regularly as the year comes round. It saves us much expense in commissions for collections and renewals. May we not request more of our good patrons to do so!

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus and terms of subscription.

San Francisco:

Saturday Morning, Sept 18. 1875

TABLE OF CONTENTS.

GENERAL EDITORIALS.—The San Francisco Cordage Company; Steam Pumps; "A Chunk of Coal;" The California Pitcher Plant, 177. Native Petroleum in Great Britain; Notices of Recent Patents: Short Lectores on Patents, 184. Metallurgy of the Copper-Silver Ores of Inyo County—No. 3; The Concentrating Works at Falun, in Sweden, 185-188. The Mining Share Market; Patents and Inventions, 188.

ILLUSTRATIONS.—The San Francisco Pump, 177. Revolving Furnace, 185.

CORRESPONDENCE.—Hydraulic Gold Mining; The Geysers—Their Wonders and Lessons, 178.

MECHANICAL PROGRESS.—The Cold Metal Cutting Disc; Novel Marine Engine; New Method of Joining Iron Hoops: An American Invention; Baking Brick; Steel Castings; Immense Steam Hammer 179.

SCIENTIFIC PROGRESS.—Remarkable Effects of Arctic Cold on Man; The Burning of Oxygen and Hydrogen; Incombustible Paper; The American Association for the Advancement of Science; Progress of Telegraphy—One Wire for Many Instruments; Dangerous Explosive Mixture; Photographing Children; Electricity in the Arts; Concentrated Fire of Artillery, 179.

MINING SUMMARY from the various counties in California, Nevada and Idaho, 180-181.

USEFUL INFORMATION.—Snakes in Ireland and Irish Oak; Buttons from Pebbles; Water Supply Works; Asphalte for Paths and Roadways; Chinese Bronzes; American Oil in Japan; Clay Pipes; Snake Skin Shoes; Utilizing Sawdust; Fern Leaf Ornaments; Steamboat Power, 183.

GOOD HEALTH. Death in the Nursing Bottle; Causes of the Decay of Teeth; Hygiene in the Sick Room. 183.

DOMESTIC ECONOMY.—Horse Flesh as Food; Choice Treatment of Foods, 183.

MISCELLANEOUS.—Too Costly a Style of Architecture, 178. The New Railway Tunnel; Art Education for Mechanics; Circular Saws for Re-sawing; Lac; The Newport Coal Company; Building Societies in England and Wales; Wooden Shoe Manufactory; Rochester Flour; Edge Tools; How They Drop Shot; Aluminum, 182.

GOLD MINES IN FRANCE.—According to a letter from Hennebont, in the department of Morbihan, some gold deposits are looked for in the western provinces of France. A few days ago some men were breaking up some stones on the road leading from Hennebont to Kervignac, when one of the stones, harder than the rest, was thrown on one side by one of the laborers, who had not been able to break it. The foreman snatched the hammer from the hands of one of his men, struck the stone a few sharp blows, and broke it. To the surprise of every one the stone was thickly streaked with some yellow metallic substance. The foreman picked up the pieces, placed them in his pocket, and on arriving home in the evening showed them to a jeweller, who informed him that the metallic substance was gold, and offered him $100 for the stone. The news spread like wildfire through the town, old quarries are being explored, and every one is seeking an auriferous deposit, which all assert must exist somewhere in the neighborhood.

A SUSPECTED RUSE.—It has been suspected that the cool and persistent manner in which certain English manufacturers recently proclaimed that they would not exhibit at Philadelphia next year was a ruse; that their object was to lull the manufacturers of other nations into a sense of security and then turn out in full force and make an exhibit which would overwhelm them. Johnny Bull is a sly dog.

THE Russian River Land and Lumber Association have purchased the land of Purington & McKenney, on Russian river, opposite the mouth of Austin creek. They will build their engine houses and machine shops at this point and lay off a town. They have also bought the land of William Carlisle, adjoining the Moore tract of land from H. Ludolf.

Native Petroleum in Great Britain.

Notwithstanding the island of Great Britain was the first country in the world to produce coal oil in merchantable quantities, which it did, some forty years ago, from a spring in a coal mine in Scotland, near the English border, we believe that this article has never been found, native, in any other locality in Great Britain until quite recently. We are now, however, told that veritable coal oil springs have recently been found in another coal mine, in North Staffordshire. In relation to this discovery, a correspondent of *Iron*, writing under a recent date, says:

I had an opportunity this morning of seeing what is perhaps the only instance in the kingdom of a petroleum spring. It is in a pit near Longton, the courteous manager of which guided me through the workings, and showed me in many places the petroleum oozing through the ground and collecting in small pools, just as water does in a very damp and marshy soil. The petroleum is at first a treacly-looking mass, not flowing readily in cold weather. It is collected in barrels, which are carried above and emptied into a tank, which is warmed by steam, and the crude hydrocarbon is run off from a little water which occurs with it, and sold for purification. Five or six tons per week are collected; a valuable addition to the output of coal. I was informed that no inconsiderable quantity of solid paraffine could be obtained from this petroleum. It certainly is a good burning oil, being used in the pitshaft."

The oil obtained from both of the localities above named is, we believe, perfectly identical in character with the native petroleum of this country; and the fact that it is found in England only in actual or near contact with bituminous coal, furnishes additional evidence of its carbonaceous origin. The first discovery of oil above referred to, was made directly in the mass of the coal seam—the coal itself was saturated with the liquid. In taking it out a pit was sunk in the coal and small channels made to conduct the fluid into the same, from which it was taken out in buckets and placed in barrels for transportation. The coal obtained at this mine was used for making illuminating gas, and was mostly shipped to London for that purpose. It was rich in hydrocarbon.

A Minature Engine.

There is now on exhibition at the Mechanics' Institute Fair a miniature steam engine which has good claims to being the smallest steam engine in the world. It was made during leisure hours by C. C. Thomas, engineer at the California mill, in this city. Mr. Thomas had his attention attracted some two years since by an item in the MINING AND SCIENTIFIC PRESS, to the effect that a steam engine had been built in New York which could be covered by a lady's thimble. He thought he would try and build one himself which could be put under a very small thimble.

The result of his labors is now shown. The engine is a vertical one, three-quarters of an inch long in its greatest proportion. The cylinder is one-eighth of an inch bore and three-sixteenths of an inch stroke. The valve moves one-thirty-second of an inch. The engine is made of gold and silver, the working parts, however, being made of steel. The whole thing is set on a California gold dollar and can be covered up with a No. 6 thimble.

Mr. Thomas made a little lathe to turn out the different parts of this monster piece of machinery, and every piece is as perfect as it would be in one of a large scale. The engine is all constructed in such a manner as to be taken apart, the whole being made like an ordinary engine. It ran as well the first time it was tried as it ever has, and when we saw it at work the other evening at the Fair it was working away as smoothly and easily as possible, being connected by a belt to a fly wheel. Mr. Thomas has a good magnifying glass on hand so that people can examine the engine closely if they wish to. It was built for amusement, during leisure hours, and to show what could be done on a very small scale. Just for the fun of the thing we have calculated the horse power of this little engine, running 500 revolutions per minute, under a pressure of ninety pounds of steam. Its power is one-twenty-five-hundredth part of one horse power, or worked down to a fine point decimally, .0004013187609375.

Although this is really a wonderful little engine, its owner has nearly completed one still more marvelous. It is a horizontal steam engine on a gold bed-plate just half an inch long. It will have a cylinder one-sixteenth of an inch bore and three-thirty-seconds of an inch stroke. The valve in this engine will move only one-sixty-fourth of an inch. It will be complete in all its parts like the other and admit of being taken apart and put together. We examined the pieces of this little marvel of mechanism the other day, and under a glass one could see with what skill the different parts were made and how delicate they were. It is now nearly completed and when done will without doubt be the smallest engine in the world, being even more diminutive than the vertical engine.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

HARVESTER.—Joshua B. Webster, William A. Dorr, Stockton, and Martin McClenathan, Merced. This invention is an improvement on the harvester or header heretofore patented by these same parties, viz.: in April, 1874. The improvement consists of an improved arrangement of the loose gear wheel employed to drive the machine and an improved bearing for the pitman lever which drives the sickler. The device may be briefly described as follows: A gear wheel is attached to the frame of the header, and is made loose upon the end of the shaft by means of a slot or key way partly through one side of the central hole through which the shaft passes, so that the key way is on the inside of the hub. The end of the shaft is provided with a short projecting pin, which enters the slot and receives the gear wheel, after it is slipped upon the shaft. A collar is placed upon the shaft inside of the gear wheel, and moved up against the end of the hub and received by a set screw. By this means the gear can be made to engage with the pinion on the transverse shaft, which passes across inside of the gear wheel with more or less mesh according to the work to be done. The wheel is also loose upon the shaft, so as to provide against any irregularity of casting. The pressing roller which is secured to the end timber of the header frame, is made adjustable by slotting the screw holes in the plate through which it is screwed to the under side plate. The ends of the shafts of the bearing which are provided with enlarged heads, which prevents them from shifting their boxes when the weight of the machine comes upon either wheel as upon a side hill. The friction is relieved by securing a wear plate on the under side of the beam beneath which the lever is secured and another on the upper face of the lever with a circular rim.

EDGE MORTICING MACHINE.—Charles J. Hardy, San Francisco. This is a portable machine especially designed for making mortices for the reception of mortice locks in the edge of doors or any piece of timber. It is provided with two clamping jaws to hold it fast to the door or timber in making the mortice. The frame of the machine consists of a bottom and top plate connected at corners by four rods which serve as guides for the two heads which support the boring and morticing tool. The morticing tool consists of a concave-convex bit, one edge of which is bevelled and sharpened on the cutting side, the points being bent at right angles to the bit, so as to stand across the end. The back of the tool is provided with a spiral groove and a spindle is provided with a spiral groove along a portion of its length so that it will clear itself of the cuttings or borings of the tool. This tool will not only bore a hole similar to an auger hole, but after the hole is bored it can be lengthened by moving the tool up and down slowly, so as to cause it to cut a groove or mortice equal in width and depth to the original boring or auger hole. The machine is operated by two cranks. A rim or flange can also be sunk, if desired, around the mortice by simply securing one or more short cutting bits to the outer face of the head at the bore of the cutting tool.

BALING PRESS.—H. L. Pike, Seattle, Washington Territory. This is an improvement in baling presses by which the inventor is enabled to make the action continuous, forming and pressing the bale at the same time. The machine is an upright box or case into which the material to be baled is fed from the top alternately from one side and the other. Two pressure platens are operated, alternating from one side and the other, so that they are carried in above the material and drawn down upon it, the plate below being withdrawn just as the other passes in above the new charge until the bale is sufficiently large, when, being tied, it may be discharged below and another introduced to pass down in turn.

ENGLISH COLONIAL RAILWAY.—In Cape Colony, Africa, about 800 miles of railway are about to be constructed at a cost of twenty or twenty five millions of dollars, and in New Zealand there are 550 miles of railway in construction, and 360 more authorized. India has already 5,872 miles of railway open, while 1,927 miles remain to be completed.

WORK is progressing rapidly on the Guerneville branch of the N. P. R. R. About 150 men are at work and the road has been graded from Fulton through Fulton's, Peugh's and Espy's places, and they are now at work on Meacham's and Drennen's places. There is about 35 feet on Drennen and Carriger farms.

EXTENSIVE beds of porcelain clay have been discovered near Los Angeles, and arrangements are being made to establish a manufactory of queeneware and pottery.

Short Lectures on Patents.

No. 14—By J. L. BOONE, of the MINING AND SCIENTIFIC PRESS Patent Agency.

Infringements.

It is an infringement upon the rights of a patentee for another person to make, use or sell a patented article or machine without first having obtained the right to do so. Every article or machine constructed in the manner described or claimed in a patent is supposed to yield a certain profit, called a royalty, to the patentee, but when the royalty has once been paid upon a manufactured article or machine it becomes an article of commerce, to be used and sold in any way the owner may see fit. These facts are pretty well known by most people but there are some who contend that it is no infringement for a person to manufacture a patented article for his own use. This is an error. It is not only an infringement for an unauthorized person to make a patented article but it is equally an infringement for the manufacturer of such a machine, or anyone else, to use it after it is made, and the patentee can sustain a suit for infringement as well against the user as against the manufacturer. An inventor cannot prevent others from making and using a machine or device which he has invented before he secures his patent for it, but when he does receive his patent he can maintain a suit against the user and prevent the future use of it, unless the royalty demanded is paid. If the inventor gives another person the privilege of manufacturing a machine which he has invented before he obtains a patent for it, the party thus priveleged can continue to use the machines thus manufactured after the patent is obtained or until they are worn out without liability to the patentee for royalty, as the granting of such a privilege by the inventor previous to the issue of the patent is considered in the light of a special license which will continue with the machine even after the patent is issued, but where no such privelege is granted and another manufactures the machine, before the issue of the patent, the further use of the machine after the issue of the patent is an infringement of the rights of the patentee.

It is no infringement upon the rights of the patentee if another and unauthorized person builds a single machine for the purpose of experimenting with it in order to improve it, but the use must be strictly experimental and not for profit.

It is not necessary that a patentee should give an infringer notice that he is infringing before commencing a suit against him to restrain him from continuing the infringement, but the patentee cannot collect damages from the infringer if it is proven that he (the patentee) failed to mark the articles or machines manufactured by him under the patent with date of the patent, and did not give the infringer any personal notice that the invention was patented and that its manufacture was an infringement; but when the patentee has fully complied with the law by marking each manufactured article or machine with the date of the patent no further notice is required to be given and the patentee can commence suit against the infringer, first, for an injunction to restrain him from continuing the infringement, and secondly for damages for past infringement. These cases are usually tried by a jury and in assessing damages the juries are required to base the amount upon the actual damages which the patentee has sustained by reason of the infringement, but in all cases of willful infringements the court can treble the amount of damages given by a jury.

The prosecution of infringement rests is the duty of patent lawyers; those who make this branch of the law a specialty. Few lawyers possess the mechanical ability to undertake patent cases, and the law of patents is but little understood by the larger proportion of the legal fraternity. A patent case can be more easily defeated by an ignorant attorney than any other kind of a case, no matter how good a cause of action exists. Generally speaking, it is better to pay a good patent lawyer a large fee than to accept the services of an ordinary lawyer for nothing, because the future value and even existence of the patent depends upon its success or non-success before the courts, and as a patent usually has only a single legal ordeal to pass through in order to determine its validity it is a necessity to have it properly represented and protected during this trial. Following is the section of the law relating to the infringements of patents:

"And be it further enacted: That damages for the infringement of any patent may be recovered by action on the case in any circuit court of the United States, or district court exercising the jurisdiction of a circuit court, or in the supreme court of the District of Columbia, or of any Territory, in the name of the party interested, either as patentee, assignee, or grantee. And whenever in any such action a verdict shall be rendered for the plaintiff, the court may enter judgment thereon for any sum above the amount found by the verdict as the actual damages sustained, according to the circumstances of the case, not exceeding three times the amount of such verdict together with the costs."

WORK has been suspended on the narrow gauge railroad at Tomales.

Metallurgy of the Copper-Silver Ores of Inyo County—No. 3.

[Written for the PRESS by SAMUEL PURNELL.]

The Solving Process.

About the year 1848, the celebrated Dr. Percy, of London, suggested the use of hyposulphite of soda for dissolving chloride of silver. In 1858 the soda salt was successfully applied on a working scale by Van Patera. Within the last five years it has been successfully adopted in seven works in Mexico, and by Mr. Guido Kustel, in Idaho and California. From an excellent manual on this process by Mr. Kustel, many of the following facts and figures are derived. The manipulations, in brief, consist of: 1—roasting with common salt; 2d—dissolving the chloride of silver with an alkaline hyposulphite; 3d—precipitation of silver sulphide by an alkaline sulphide; 4th—reduction of silver sulphide by heat. As first practiced by Patera, this process was too costly and delicate to suit this country, but lately, with improved furnaces and new discoveries in its working, it has become admirably suited to the needs of the Pacific coast. It is probably the only one at present known that will economically heat the class of ores now under consideration. The modern treatment will be shown hereafter.

Crushing.

The ores being freed from clay and lime as much as possible, and concentrated if necessary, are crushed in any usual manner, fine enough to pass through No. 24 or No. 30 screens. This has been found fine enough to admit of good roasting and good leaching. Very fine ore is difficult to leach. The object in removing as much clay and lime as possible, is that they become very fine in the filtering boxes and obstruct the passage of the solutions. The lime also consumes salt and lime sulphide.

Roasting.

The ores being crushed may now be roasted. This may be performed either in the long reverberatory furnaces, already familiar, or in the Bruckner cylinder to an equal, if not greater advantage in point of efficiency, and to a decided advantage in point of cost.

Roasting in the reverberatory furnace can scarcely be done under $10 per ton, while the cylinder will do the same work for $6, and less. The cost of the cylinder, $2,000, is less than a reverberatory furnace. The cylinder is usually constructed twelve feet long and five feet six inches in diameter; it is lined with common brick, and revolves upon friction rollers at the rate of one turn per minute. The charge for a furnace of this size is about 4,000 pounds of ore and the necessary salt. An inclined diaphragm causes the ore to pass back and forth through the glowing gases. The capacity, depending on the character of the ore heated, will be from eight to ten tons per twenty-four hours. In Colorado these furnaces have chloridized up to ninety-six per cent. in actual working at an expense of $5.50 per ton. The cylinder allows of an almost complete chloridizing; is economical of fuel; the progress of the work is at all times under control; the ore is moved entirely by machinery; the attention required is only part of the time of one man. Still, in Mexico, they generally prefer the old form of long reverberatory, principally for local reasons. Mr. Bruckner's furnace, sections of which are herewith shown, was described in detail in the MINING AND SCIENTIFIC PRESS, of May 1st, 1875. Should the crushed ore contain a sufficient amount of copper to render its extraction profitable, it is now mixed with a certain proportion of salt, and introduced into the furnace. If there is not enough copper present to warrant its extraction it is best not to add the salt till after the oxidizing roasting, or the turning of all base metals into oxides. To chloridize the copper, about two pounds of salt extra should be added for each pound of copper in the ore. To chloridize the silver, from five to ten per cent. of salt must be added, according to the assay value. Other base metals besides copper will consume a portion of the salt, so that the entire amount to be added will depend on the ore; the amount necessary will soon be learned by trial. On the matte assay, should ore prove to be so deficient in sulphur, as not to furnish a sufficient amount of sulphuric acid to decompose the salt, some sulphur must be added, or sulphurous acid fumes be introduced continuously into the furnace. The heat is regulated to a dark red, and when the sulphates and oxides are fully formed, the heat is raised sufficiently high to decompose the sulphates and liberate sulphuric acid. The acid in turn decomposes the salt, liberating chlorine (which being in a nascent state has intense combining power), and in an hour or more the silver and copper will be fully chloridized and soluble. Samples may be taken from the furnace at various times and assayed for chlorides. The time required will depend materially on the amount of base metals present—a comparatively poor ore roasting in less time than one inclined to sinter and bake. As soon as the copper and silver are chloridized, the ore should be removed from the furnace in order to retain the base metal oxides as far as possible in that condition. Not much fuel is required till near the end of the roasting. At least ninety per cent. of the silver should be chloridized, and all the copper. Should the ores contain a very large quantity of antimony and arsenic (antimoniate and arseniate of silver are very imperfectly decomposed by chlorine), it would be best to roast with the admission of superheated steam, as then through the formation of hydrochloric acid these metals are converted into volatile chlorides. By this the loss of silver is very much lessened. The use of steam however, necessitates the use of about double the usual quantity of fuel for roasting. The order of decomposition of sulphides is about as follows: Iron, copper, zinc, lead, silver, antimony, arsenic. Care should be taken that the roasting is not carried too far or the heat raised too high, or else the copper will lose its chlorine and be converted into insoluble oxide.

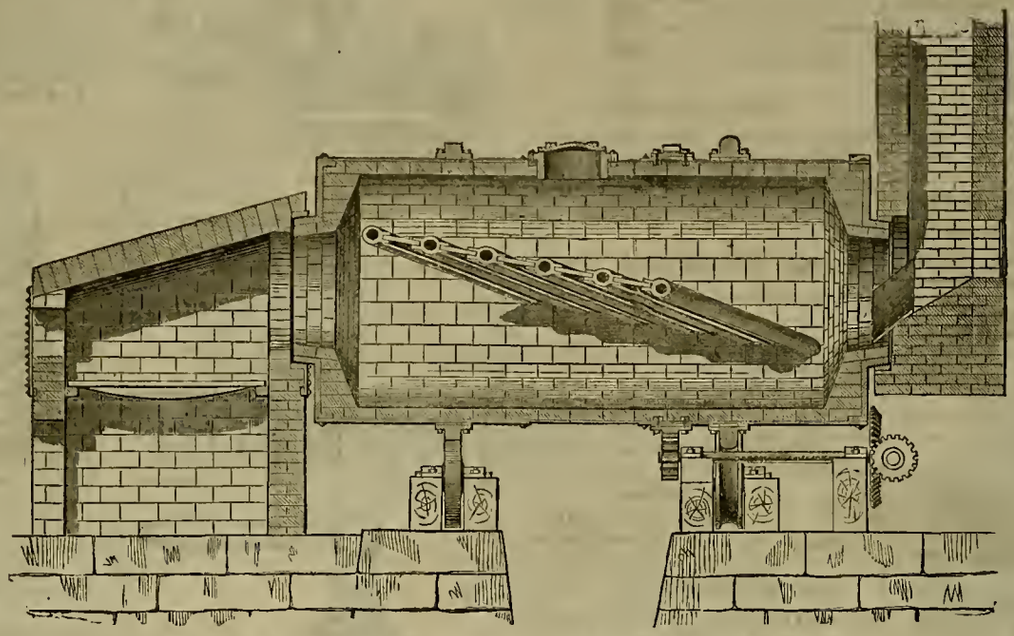


Fig. 1. Longitudinal Section Through Axis of Bruckner Revolving Furnace.

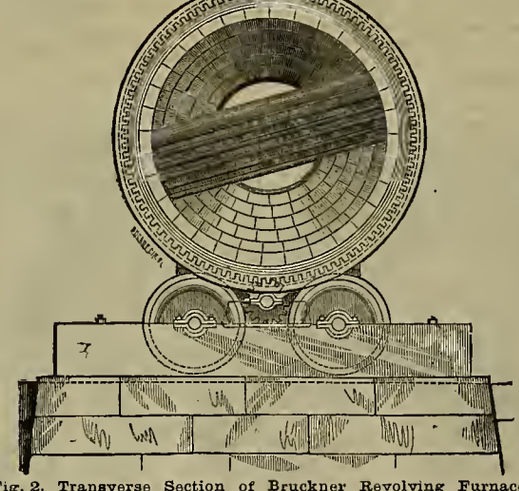

Fig. 2. Transverse Section of Bruckner Revolving Furnace.

Some metallic copper would also be formed, which would inclose particles of silver. If the amount of copper present is valueless, the heat must be raised to a light red to destroy the chloride and thus eliminate it from subsequent operations. Unless a very high heat is employed the silver chloride is permanent. Fifteen per cent. lead ores can be readily roasted without sintering, and the lead present can be so nearly neutralized as not to interfere with the remaining operations. The formation of base metal chlorides can be avoided by an oxidizing roasting with steam, after which salt and sulphurous acid can be introduced to chloridize the silver. Should the silver chloride be decomposed by too great heat, metallic silver would be formed, which would be lost in leaching. As with all other systems of roasting, suitable dust chambers should be provided. It is a great mistake to neglect the precaution of dust chambers, for often the fine dust escaping is very rich, and is otherwise entirely lost.

[To be Continued.]

A RIOT took place in the North Carolina gold section, last Sunday.

The Concentrating Works at Falun in Sweden.

In a previous article I have given the results of concentration in a California mill, the material under treatment being quartz, containing auriferous pyrites of copper, arsenic and iron.

Careful trials, with large quantities of rock, had given 19½ to 26 per cent. of the gold value, as being the average yield obtainable by the use of sluices, Hendy's concentrators, percussion tables (Rittingar's, roughly made) and blanket sluices. The yield was "believed" to be, by some, "at least 90 per cent."

This estimate is modest, compared with other reports of "results," obtained with new processes and machines, which have been trumpeted out to the mining public from time to time. Have we not a dry concentrator that is claimed to have saved 90 per cent. of the assay value, out of a silver ore? and even a process yielding 102 per cent. has been accounted to us, as among the wonderful creations of native genius.

The subjoined sketch of the works, and the work in use at the present day in the treatment of the ores from the mines at Falun, is chosen for comparison, for the following reasons:

The new concentrating works at Falun in Sweden are pronounced by some of the most experienced European concentrating men, to be the most masterly solution of the problem of concentrating poor ores, obtaining a high percentage of the valuable mineral at small expense, and in a reliable mechanical manner, depending little on the skill and attention of the workmen.

The apparatus there used may be considered models of good construction and suitability. It is the principle of continuity, applied to operations, apparatus and their disposition, in a manner nowhere excelled; and from this point of view, the Falun creation deserves the predicate of being the most perfect concentrating establishment in Europe, and therefore in the world.

The apparatus there used are such only as are now recognized—wherever the principles of concentration are well understood—to be the most perfect and efficient of all the great number that have been invented within late years, and which are therefore superseding all others in the many extensive concentrating establishments of Europe. Already seven years ago, during a seven months' tour through the mining districts of that continent, the writer witnessed the erection of a variety of constructions based on the same principle, in a dozen different works, and for the treatment of almost every kind of ore. Though many of these constructions proved faulty, and give way to others, the correctness of the principle remained intact, and has everywhere been recognized and verified by the astonishing results obtained in a number of places for years past. Experience and experiment have led to important improvements and simplifications in the construction of these machines, so that finally a few standard types were arrived at, which answer all requirements, and which excel all other constructions to such an extent that the latter no longer deserve notice for practical purposes.

The concentrating apparatus here mainly referred to are:

The continuous or Harzir Jiggers.

The Rittinger percussion tables.

The rotating continuous buddles.

The endless belt table.

The first two of these are of particular interest here, as being the ones best adapted to meet the peculiar requirements of our local circumstances.

The manner of their application in Falun, is also the one most suitable here. From a concentrating point of view the ores of Falun, of all European examples that could be adduced, also more closely resemble those which here are most frequently the subject of treatment, *i.e.*, the relation of specific gravities of the minerals to be separated is the same, as well as their relative percentage. The gangue there is quartzose, as here, and the principal mineral to be separated, pyrites, in quantity average not more than two-third per cent. The ratio of specific gravities being near the lower limits of occurrences in practice, the applicability of the same general method of treatment, to any other ore, with equal success, follows as a matter of course.

Briefly stated then: Of all European concentrating works of established merit, those at Falun most perfectly represent the principles, the apparatus and the mode of their application, which at the present time stand most approved as the result of the research and experience of centuries; and are there used under conditions which most closely resemble those most frequently presented on this coast.

A description of what has proved itself to be a masterpiece of success, among the successful and experienced, ought to present valuable hints to the practice of a mining region, which has shown itself so devoid of these qualities as this; for it may be boldly asserted, that none of the machinery or other methods of concentration, so far need here, have given results that will at all compare with those generally obtained in European works, even when the question of cost and profit is not considered. It cannot be claimed in this instance that peculiar local circumstances sanction the use of machinery which, at a greater first cost and less durability, does less, at greater expense, than other arrangements, which can everywhere be built with equal facility and minus "patent" claims.

The copper ores from near the mines of Stora Kopparberg, near Falun, are separated into two main classes:

1. Into so-called Blodmalm (soft ores), and
2. Hardmalm (hard ores).

The first of these, composed principally of iron pyrites with one-half per cent. copper, is broken up and charged in the "raw smelting" of the hardmalm (having for its object the formation of a matte of certain composition, for subsequent roasting). The latter, the hardmalm, contains copper, iron and magnetic pyrites, besides some galena and zinkblende in quartz, talcose slate and hornblenda, etc., from which, hitherto, ores containing four-fifth per cent. copper were obtained by hand separation, for the purpose of raw smelting; all poorer ores, the so-called "trikmalm"—containing about one and one-half per cent. copper—were laid aside as worthless for the time being.

It may be mentioned here that the wealth of the mines was much greater in early times, the cost of production, and the expense for fuel, timber, etc., at the same time less than at present, whereas the price of copper in the meantime has declined more and more.

In order to be able to compete successfully under these circumstances, with other copper smelting establishments at home and abroad, ways and means had to be found to diminish as much as possible the cost of production and reduction of the ores. To this end, the erection of extensive mechanical concentrating works was determined upon, after having previously become convinced, by carefully conducted experiments with a variety of improved

Averill Chemical Paint,
MANUFACTURED BY THE
Cal. Chemical Paint Co.

PURE WHITE, AND ANY SHADE OR COLOR.

This Paint is prepared in liquid form, READY FOR APPLICATION—requiring no thinner or dryer, and will not spoil by standing any length of time.
It is Cheaper, more durable, more Elastic, and produces a more Beautiful Finish than the best of any other Paint.
It will not Fade, Chalk, Crack, or Peel off, and will last twice as long as any other Paint.
In ordering White, state whether for Outside or Inside use, as we manufacture an Inside White (Flat) for inside use, which will not turn yellow, and produces a finish superior to any other White known.
Put up in ¼, ½, 1, 2 and 5 gallon packages, and in Barrels. Sold by the Gallon.
For further information send for Sample Card and Price List, or apply to the office.

AMMONIA!
For Washing and Cleaning Purposes.
For Sale by all Grocers.

This article is universally used in Europe, and, recently introduced for general family use in San Francisco and neighborhood, is already in great demand. It is now the intention of the manufacturers to introduce it all over the Pacific Coast, at prices which will bring it within the reach of every household.
It is unequalled for cleansing Woolen Fabrics, Cutlery, Carpets or Crockery; for Scrubbing Floors, Washing Paint, Removing Grease Spots, Shampooing or Bathing.
It renders water soft, and imparts a delightful sense of coolness after washing.
DIRECTIONS.—For Laundry, use two to four tablespoonfuls to a washtub of water. For bathing, use one tablespoonful in the bath tub. For removing grease spots, apply with a brush, undiluted, and wash with water afterward. For stimulating the growth of plants, use a few drops in every pint of water used in watering.
PRICE.—Per Pint Bottle, 25 cents; per quart Quart Bottle, 40 cents; per Half Gallon, 75 cents.
Also, SULPHATE OF AMMONIA for chemical purpose, fertilizing, and the preparation of artificial manures. AMMONIACAL PREPARATION, for the prevention and removal of boiler scale. CRUDE AMMONIA, for general manufacturing, and PUR. LIQUOR and AQUA AMMONIA for chemical and pharmaceutical purposes.
☞ Manufactured by the
SAN FRANCISCO GAS-LIGHT CO.
eowhp

RUSSELL'S
OREGON PILE CURE.

To those suffering from Piles—External, Internal and Itching Piles: You can be cured, as hundreds of others have been. Send for Circular and see undoubted testimony. Will send sample bottle for $1, or 6 bottles for $5.

Call upon your Druggist, or address

DR. RUSSELL,
No. 5 Post street, San Francisco.

(Continued from Page 185.)

apparatus for wet concentration, that there would be no particular difficulty in increasing the percentage of copper in the hardmalm four-sixth fold, equivalent to reducing the bulk of raw material for smelting seventy-five to eighty per cent.

It is not the object here to describe the individual machines and apparatus used in these works, in detail—it would lead too far; their main features may be found described in the Reports of the Commissioner of Mining Statistics; in a translation of Rittinger's classic work on concentration, and in Guido Kustel's book on the same subject. My object is rather to attempt in brief survey to picture the general arrangements of the Falun works, mentioning such improvements of value as are not described in the above mentioned treatises on concentration, and give a short statement of the working results. All the data are translated from a description furnished by the constructing engineer and director of the establishment, Mr. E. Heberle, and may therefore be considered perfectly reliable.

The main peculiarity of the works consists therein, that all the raw material, as well as all resulting intermediate products, are transported by automatic mechanical appliances through the whole establishment, and are distributed to the respective machines with the greatest precision, to a nicety not attainable by manual labor. The ores and other products for the smelting works, are delivered from the machines and apparatus directly to their proper receptacles, while the waste sands are likewise carried to their place of destination by mechanical arrangements.

The attempt has here been made, therefore, to carry to the highest limit the principle of continuity, the constancy of operation, so that in the real sense of the word the labor of the hand has become the work of the machine.

The building of the works was begun in June, 1868, and operations were commenced in August, 1870.

The buildings are built with slag brick, the size of the main building being 278x54 feet, and 20 feet high to the span beams. The wings at each end are 195x82 feet, and 17 feet high. The walls, two feet nine inches thick, are hollow, a five inch space being left between an inner and an outer wall, as a protection against the very severe cold of the northern winters; furthermore the building is provided with double windows, and the rafters are boarded in, the spaces being then filled with sawdust, or other poor conductors of heat. For the illumination of the establishment special gas works are provided, and so arranged as to serve for heating purposes at the same time.

The motive power is obtained for the present from two Fourneyron's turbines of respective forty-eight and twenty-eight horse power. They are built directly into the Ostanfors Au, a stream connecting two lakes, which furnishes per second 100-120 cubic feet of water. The fall is at present six and one-half feet, but it will be increased to twenty-six feet by damming and dredging the stream.

The power is transmitted into the works and distributed to the various machines, partly by wire rope, partly by bolting.

The ore is carried by railroad from the mine into the garret of the main building, and directly into the respective hoppers.

CHAS. C. RUEGER.

[To be Continued.]

Life Saving Stations on the Pacific Coast.

A Washington dispatch states that the Treasury Department is making preparations for the early establishment of the life-saving stations authorized by Congress for the Pacific coast, and the Commission designated for that purpose have located sites for them as follows: At Neah bay, upon the Indian reservation; at Shoalwater bay, upon the lighthouse reservation; at Cape Disappointment, upon the military reservation; at Cape Arago, upon the lighthouse property; at Humboldt bay, upon the lighthouse property. For the stations designated in the Act for Point Reyes, the site selected is near Duxbury; for stations authorized to be established between Point Lobos and Point San Pedro, a site is selected near the beach on the southwestern extremity of the Golden Gate park, the Park Commissioners of San Francisco having granted the use of the land for that purpose. The station designated for Point Concepcion will be located about two miles east of the lighthouse, at what is known as the Caxa harbor. It is expected that all those stations except that at Shoalwater bay and Point Concepcion will be manned by volunteer crews. The one at Neah bay will be manned by Indians. The Indians there are very peaceful and friendly, and are expert surf men. Regular crews will have to be stationed at two of the stations named above. Proposals will soon be received for the construction of station houses.

DAMAGE BY LIGHTNING.—A large amount of property in Maine has been damaged by lightning this summer. On a single day, not long since, ten buildings were struck and burned in various parts of the State, and a loss of $17,000 thereby entailed. But then they have no earthquakes in Maine.

THE Wilmington manufacturing company, at Wilmington, now have their shop in full running order.

The Mining Share Market.

It is now authoritatively announced that Flood & O'Brien's new Bank of Nevada will commence business on the 4th of October, and it is expected the Bank of California will reopen its doors on the same day and the session of the San Francisco and Pacific Stock Board will undoubtedly be resumed at that date. In the meantime the California Board and curb stone operaters are doing a rushing business. The mining share market has shown a stronger tone during the present week.

The sales in the California Board Wednesday were the heaviest known in that institution for a long time, and may be taken as an indication that some parties are squaring accounts; to be more explicit, that some of the leading brokers are settling back accounts with a view to preparing for the active resumption of regular business. In the morning session of the Board the sales aggregated 7,950 shares, and in the afternoon session, 6,430 shares, making a total of 14,380 shares for the day. The sales on the street were also very large, and included 1,200 shares of Mexican, 1,000 of Ophir, and, at least, 1,000 of Imperial. At 5 P. M., sales were made at the following rates: Savage, $80; Ophir, $50 and $50.50; California, $57; Best & Belcher, $41 and $40.50; Mexican, $19 and $18.75; Belcher, $19; Consolidated Virginia, $255; Imperial, $9; Gould & Curry, $16.75; Crown Point, $24; Sierra Nevada, $12.75.

This morning, Thursday, yesterday's prices were not sustained in the Board, but after the close a lively business was done on the street. There are many evidences of a reaction for the better, and all signs point to an advancing market.

The Empire mining company of Grass Valley have declared the ninth dividend of fifty cents per share, payable after September 15th. The Northern Belle has declared a dividend—the fourth of one dollar per share—payable after the 15 h inst. The Justice mining company has levied an assessm ent of five dollars per share on the old stock, issued prior to August 16th, 1875, and one dollar per share on stock issued since that date.

The following assessments have been levied since our last: North Carson, Andes, Buckeye, Independent, Eagle, Pioneer, Edith, Newark and Gold Mountain.

The reports continue favorable from all mining districts.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C., Sept. 14th, 1875.

FOR WEEK ENDING AUGUST 31ST, 1875."

BRIDLE BIT.—Soren H. Holm, S. F., Cal.

MACHINE FOR COUNTING STOCK.—William F. Jeans, and David H. Bailey, Ferndale, Cal.

SALINO PRESS.—Denning L. O'Connor, Covel, Cal.

—The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

LET THE PEOPLE SPEAK.

MANHATTAN, Kansas.

R. V. PIERCE, Buffalo, N. Y.:

Dear Sir—Your Favorite Prescription has done my wife a world of good. She has taken nearly two bottles and has felt better the past two weeks than at any time in the past two years. No more periodical pains; none of that aching back or dragging sensation in her stomach she has been accustomed to for several years. I have so much confidence in it that I would be perfectly willing to warrant to certain customers of ours who would be glad to get hold of relief at any expense. I have tried many Patent Medicines, but never had any occasion to extol one before. Very truly yours,

GEO. B. WHITING.

Mrs. E. R. DALY, Metropolis, Ill. writes:

"Dr. R. V. Pierce—My sister is using the Favorite Prescription with great benefit."

MARY ANN FRISBIE, Lehman, Pa., writes:

"Dr. R. V. Pieros—What I have taken of your medicine has been of more benefit to me than all others and hundreds of doctors' bills."

Dr. Pierce's Favorite Prescription is sold by dealers in medicines generally.—Com.

THOUGHTLESSNESS.—Persons sometimes return their paper, marked "stop this paper." Their name being pasted on the sheet they think that is all we need to be able to cross their names off. Now that is thoughtlessness. Your P. O. address is needed as much as your name. We have thousands of names arranged only according to locality. Our mailing clerk does not know where everybody lives.

WOODWARD'S GARDENS embraces an Aquarium, Museum, Art Gallery, Conservatories, Tropical Houses, Menagerie, Seal Ponds and Skating Rink.

MINING SHAREHOLDERS' DIRECTORY.

Compiled every Thursday from Advertisements in the Mining and Scientific Press and other S. F. Journals.]

Paper Making.

If any of our readers, who have leisure, will take the Sancelito ferry boat, and, after crossing the bay, jnmp aboard the narrow gange cars of the North Pacific Coast railroad company and take a ride over that road, they will not only be pleasantly surprised at the varied and interesting scenery through which it passes, but will wonder that so little is known, by the people at large, of the existence of such a railroad in California.

Evidently it has not been "written np" much, but, come to think, it is very young, and yet in its swaddling clothes. The railroad has nothing particular to do with our anbject, however, but as the reader "does the road," he will, at a point about fifteen miles from San Rafael, see, through the trees, a cluster of white buildings with usual external evidences of industrial occupation within. This is the birthplace of the paper manufacturing interest of the Pacific coast. Here, in this quiet country, far away from the never ceasing strife, excitement and allnrements of the city, may be heard the song of the mill, night and day, telling a tale of thrift and happiness. This is the

Pioneer Paper Mill.

And was bnilt in 1856, by S. P. Taylor & Co. The existence of the mill is, therefore, nearly twenty years, and, as the annual prodnct is about $75,000, the total product, since its inception, has amonnted to nearly one and a half millions of dollars, nearly the whole of which sum is retained on this coast. As the world goes, everything is measured by a yard stick composed of dollars and cents, and it is eminently proper that we should cite this instance of the benefits derived from encouraging home industry.

Though the amount is insignificant compared with some prodncing interests, yet the argument is indisputable that if the Pioneer paper mill had no existence, this million and a half would have been lost to this coast, and benefited other communities. On the other hand, this little stream of money is distributed among the popnlace, benefiting all a little.

This argument might be extended to a certain limit, and that the capacity of the country. Had we on this coast iron, steel, cotton, woolen and other manufactories, in a sufficient nnmber to supply bnt half of the trade of our merchants who get their stocks from the East and Europe and therefore become the debtors of other countries, it is very probable that the recent panic would not have occurred. The panic was said to have been caused by the scarcity of coin—some said "lock np of coin." Is it any wonder coin should be scarce and not be felt, when our merchants, to avail themselves of the high premium on gold, some three months ago, sent away fourteen millions of dollars in excess of ordinary, to square np with their Eastern creditors?

The Pioneer paper mill is not confined to the manufactnre of any one class of paper, although the bulk of its manufacture is manila paper of excellent quality and superior strength. It also manufactures printing, hardware paper and a coarse heavy paper in rolls, which is used extensively in roofing and for carpet underlining.

For the latter purpose alone it is estimated that abont twenty tons will be required for the next twelve months. Its nse is becoming general; the cost is trifling and is saved many times over in the course of a year, in the saving of fnel. The depot of the Pioneer mills is the paper warehouse of S. P. Taylor & Co., 416 Clay street, in this city, where a large stock of news, manila, hardware, straw wrapping paper, twines, paper hags, etc., are always to be fonnd. To show the variety of papers manufactured by this mill, we may mention some of the sizes and kinds in their display at the Fair. Of manila paper they exhibit some 24x30 inch, of 60, 50 and 25 ponnds to the ream; 18x27 of 12 and 16 pounds; 24x42 of 40 and 56 pounds; 32x46 of 50 and 90 pounds. Also, some 18x24 violet colored paper, fast color, for druggists' nse, and some 24x36 and 22x32 blue, for same purpose. Of book paper they exhibit 24x38 of 40, 44 and 56 pounds. Of house paper they show 24x36 of 30 pounds; 26x38 of 35 ponnds; 28x42 of 40 ponnds and 28x42 of 42 pounds to the ream. They also exhibit some roll white paper made for wall paper, a new article of manufacture here.

We have with much interest noted the progress of this branch of home industry, with which, as pnblishers, we are so intimately concerned. And it is with pleasure that we can say that Messrs. Taylor & Co. have steadily improved their manufactures, and are furnishing to-day a quality of goods which should secure for them ready sales and rapidly increasing demands. The same amount of persistent enterprise displayed in other branches of local industries would soon double the present amount of home manufactures on this Coast.

A FEMALE weaver in the Petalnma woolen mill wove 112 yards of flannel, of fine texture, in two looms in one day's weaving last week.

ONE hundred and fifty tons of iron for the Santa Cruz and Watsonville railroad, lately arrived in Santa Cruz per steamer.

THE citizens of Santa Ana propose to build a narrow gange railroad from that point to Newport, a distance of 8 miles.

General News Items.

THE steamer *Eastport*, which went ashore at Point Arena, has been got off, and the steamer *Gipsy* has been sent up to tow her into this port. She will be repaired and used as a freight boat on the southern coast ronte, by the present owners, Goodall, Nelson & Co.

THE manufactnre of sewing machine needles is carried on extensively in Brockton, Mass., and in the past year the prodnction at two manufactories has been nearly 5,000,000. At present they are finishing about 20,000 needles a day.

A LARGE excursion party, nnder the auspices of the California Immigrant Union, left Chicago for this city on Saturday last, and will arrive the latter part of this week. The party was made np from different parts of the East.

GEORGE W. BITTENBERGER, a young medical student, was shot and killed by his brother Edward, on Washington street, last Saturday evening. There is hereditary insanity in the family.

CHAMPAIGN county, Illinois, has 2,150 acres devoted to broom-corn, and the cultivators who make this a specialty are among the most prosperous in the country.

CONDENSED AIR as a street car motor, has, it is said, been abandoned in New Haven, on the gronnd that horse power is more profitable.

A FROST in the Eastern States, and light ice formed in some sections of New Hampshire, last Snnday.

THE U. S. steamer *Tennessee* passed through the Snez canal last week.

MRS. LINCOLN has left the insane asylnm.

THE Illinois Ku Klnx are subsiding.

THE Repnblicans have carried Maine.

Mining and Scientific Press.

Started in 1860, is one of the oldest weekly journals now pnblished in San Francisco. It has been conducted by its present proprietors for ten years, during which period it has been repeatedly enlarged and constantly improved. The active and steadfast efforts of its pnblishers have gained for its conduct an amount of practical experience greater than any other pnblishers have accumulated on this coast, of a weekly journal.

The sum paid by us for the best editorial talent obtainable for our special class journal; for engravings, for interesting news and correspondence, and for printing a large-sized, handsome sheet, is unequalled by that of any other American weekly west of the Mississippi.

AS A PRACTICAL MINING JOURNAL it has no rival on this Continent.

It is the only MECHANICAL, and the only SCIENTIFIC journal of the Pacific States.

Miners, Assayers, Millmen, and Metallurgist in the United States should take it.

Pacific Coast Mechanics, Engineers, Inventors, Manufacturers, Professional Men, and Progressive and Industrial Students should patronize its columns for fresh and valuable information.

Mining Engineers, Superintendents, Metallurgists, Mine Owners and Mine Workers throughout the world should profit by its illustrations and descriptions of New Machinery, Processes, Discoveries and Record of Mining Events.

Intelligent thinkers throughout the land, in high or humble situation, who would avoid literary trash for genuine information, should SUBSCRIBE AT ONCE.

Mining and Other Companies.

Gover Mining and Milling Company—

Principal place of business, San Francisco, Cal. Location of works, Drytown, Amador county, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 31 day of September, 1875, an assessment of ten cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company, No. 402 Front street, room 8, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 11th day of October, 1875, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Saturday, the 30th day of October, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

W. O. WILSON, Secretary.

Office, No. 402 Front street, room 8, San Francisco, Cal.

Hope Quicksilver Mining Company—Lo-

cation of principal place of business, San Francisco, California. Location of works, Cinnabar Mining District, Sonoma County, State of California.

Notice is hereby given, that at a regular meeting of the Board of Directors, held on the 2d day of August, 1875, an assessment (No. 2) of Five cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, Room 2, No. 408 California street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 8th day of September, 1875, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Thursday, the 30th day of September, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

JACOB HARDY, Secretary.

Office, Room 2, No. 408 California street, San Francisco, California.

POSTPONEMENT.—The date of the delinquency of the above assessment is postponed to the 8th day of October, and the date of delinquent sales to November 1st, 1875.

By order of the Trustees. J. HARDY, Secretary.

September 8, 1875.

Manhattan Marble Company of Californ-

ia. Location of principal place of business, San Francisco, California. Location of works, Oakland, Alameda county, State of California.

Notice is hereby given, that at a meeting of the Directors, held on the 6th day of August, 1875, an assessment (No. 8) of five dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary of the company, at his office, Nos. 13 and 15 Fremont street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of September, 1875, shall be deemed delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 4th day of October, 1875, at 12 o'clock M., to pay the delinquent assessment, together with costs of advertising and expenses of sale.

L. L. ALEXANDER, Secretary.

Office, Nos. 13 and 15 Fremont street, San Francisco, California.

Mount Auburn Gold Quartz Mining Com-

pany. Location of principal place of business, San Francisco, Cal.

Notice is hereby given, that at a meeting of the directors, held on the 25th day of August, 1875, an assessment (No. 1) of twenty-five cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, No. 402 Montgomery street, room 9, second floor.

Any stock upon which this assessment shall remain unpaid on the 27th day of September, 1875, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Thursday, the 28th of October, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

C. A JAMES, Secretary.

Office, 402 Montgomery street, room 9, San Francisco California.

Orleans Mining Company—Location of

principal place of business, San Francisco, Cal. Location of works, Grass Valley Mioing District, Grass Valley, Nevada County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 8th day of September, 1875, an assessment, No. 7, of one dollar per share was levied upon the capital stock of said company, payable immediately in gold coin of the United States of America, to the Secretary, at the office of the company, room 8, No. 215 California street, in the city of San Francisco.

Any stock upon which said assessment shall remain unpaid on the 7th day of October, 1875, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 25th day of October, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

GEO. P. THURSTON, Secretary.

Office, room 8, No. 215 California street, San Francisco, Cal.

Silver Wave Mining Company—Location

of works, White Pine Mining District, Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 12) levied on the 21st day of July, A. D., 1875, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
A F Carmody, Trustee	574	250	$ 62 50
E Fisher, Trustee	552	250	62 50
W N Hawley	468	25	6 25
N Reynolds	545	20	5 00

Fremont Strsst, bet. Howard and Folsom,
SAN FRANCISCO.

PACIFIC
Rolling Mill Company,

SAN FRANCISCO, CAL.
Established for the Manufacture of
RAILROAD AND OTHER IRON
—AND—
Every Variety of Shafting,
Embracing ALL SIZES of
Steamboat Shafts, Cranks, Piston and Connecting Rods, Car and Locomotive Axles and Frames
—ALSO—
HAMMERED IRON
Of every description and size.
☞ Orders addressed to PACIFIC ROLLING MILL COMPANY, P. O. box 2032, San Francisco, Cal., will receive prompt attention
☞ The highest price paid for Scrap Iron.

Brass Foundry & Pump Factory.

A. J. SMITH, Plumber,
Sole Proprietor and Manufacturer of the
Celebrated Hudson Force Pumps, Atwood & Bodwell Windmill Brass Pumps, Smith's Copper-Lined Pumps, Plumbers' Force Pumps.
☞ Special attention paid to Brewers', Distillers', Beer and Hot Liquor Pumps, and Wine Pumps. Particular attention paid to AIR PUMPS, also to
DIVERS' SUBMARINE PUMPS.
Artesian Well Pumps Made to Order.
☞ Brass Castings Made to Order.
No. 222 FREMONT STREET, - - SAN FRANCISCO.

California Machine Works,

119 BEALE STREET, SAN FRANCISCO.

First Street, oward and Folsom, San Francisco.

Machinery and Castings of all kinds.

McAFEE, SPIERS & CO.,
BOILER MAKERS
AND GENERAL MACHINISTS,
Howard st., between Fremont and Beale, San Francisco

STEAM ENGINES AND BOILERS

Of all sizes—from 2 to 60-Horse power. Also, Quartz Mills, Mining Pumps, Hoisting Machinery, Shafting, Iron Tanks, etc. For sale at the lowest prices by
10v27tf J. HENDY, No. 32 Fremont Street.

F. MANSELL & CO.,
SIGN PAINTERS,

423 PINE STREET,
(Between Montgomery and Kearny.)

Persons engaged in the following business can have their Signs Painted at contract prices, for goods or articles in which they trade, viz:

Merchant Tailors,	Gents' Furnish'g G'ds,
Bootmakers,	Furniture Dealers,
Hatters,	Jewelers,
Hotels,	Piano Fortes,

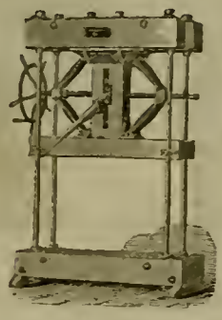
Wine Merchants, Etc., Etc.

A. L. FISH & CO.,

Nos. 9 and 11 FIRST STREET, - - - - - - San Francisco, Cal.,

DEALERS IN ALL KINDS OF NEW AND SECOND-HAND MACHINERY.

Hawkins' Blowers and Exhaust Fans.



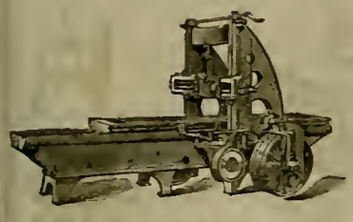
BOOMER PRESS;
For Wine, Cider, Lard, Etc.

DOUBLE-ACTING PLUNGER,

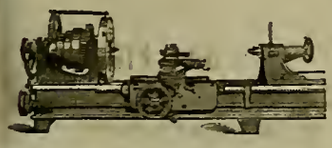
1,000 Feet Single Lift Guaranteed.

Waters' Patent Governor.

Clapp & Jones' Steam Fire Engine.

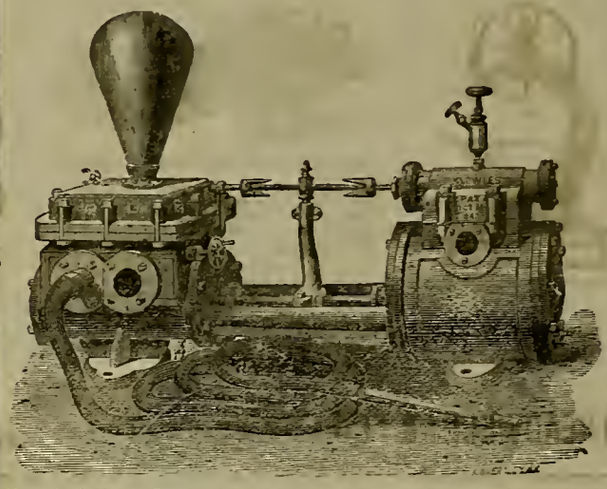


FERRIS & MILES'
Lathes, Planes, and Machinists' Tools.



FERRIS & MILES'
Steam Hammers.

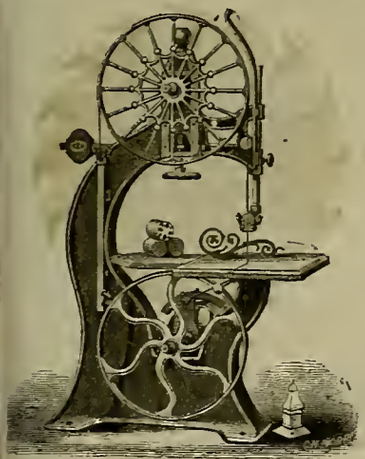
THESE ARE THE ONLY PUMPS ARRANGED TO WORK NOISELESSLY AND WITHOUT ANY SHOCK OR JAR ON PUMP OR PIPES
THESE FEATURES GUARANTEED



Knowles' Steam Pump; for all purposes where Pumping is required.

PACIFIC MACHINERY DEPOT,

H. P. GREGORY, Nos. 14 & 16 First Street,
P. O. Box 168. **San Francisco, Cal.**



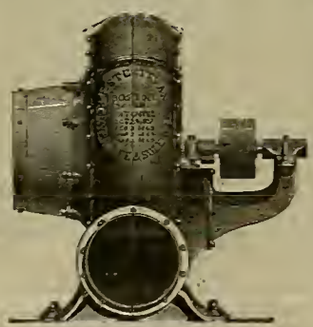
SOLE AGENT FOR THE PACIFIC COAST FOR

J. A. Fay & Co's Wood-working Machinery,

Blake's Patent Steam Pumps,

Tanite Co's Emery Wheels and Machinery,

Fitchburg Machine Co's Machinists' Tools,



Sturtevant Exhaust Fan for Removing Shavings and Sawdust from Machines.

Sturtevant's Blowers and Exhaust Fans,

J. A. Roebling's Sons Wire Rope,

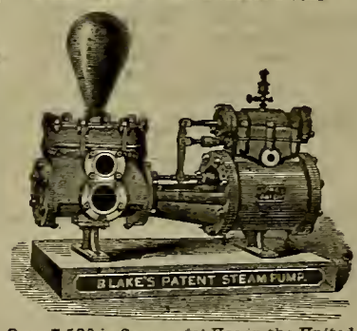
Planer Knives,

Nathan & Dreyfus' Glass Oilers, and Mill and Mining Supplies of all Kinds.

BLAKE'S PATENT STEAM PUMP



Over 7,500 in Successful Use in the United States.

54 BUSHELS OF CORN AN HOUR.

HARRISON'S LIGHT VERTICAL BURR MILLS

BARBER & BACON, MILLERS AND LUMBER DEALERS, SOUTH VERNON, VT., write July 15th:
"We have been running two of your LIGHT VERTICAL CORN MILLS for the past 6 months with remarkable results, and have ground over 80,000 bushels of corn into No. 1 meal in that time, running the grist-mill nights only, as we run our saw-mill in the day time. We have often ground in the 20-inch Mill (which weighs about 500 lbs.), 1,000 lbs. of corn in twenty minutes, or 54 bushels in one hour. Our usual night's work is about 24,300 lbs., or 434 bushels. To do this we have to run at a speed of 1,300 turns per minute, and use about a 20-horse power. You may refer parties to us for further information, and when we have tested your HEAVY VERTICAL MILL, we shall take great pleasure in giving the results."

SEND FOR ILLUSTRATED CATALOGUE AND PRICE LIST.

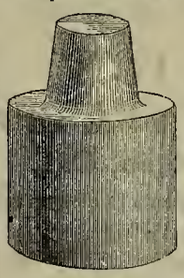
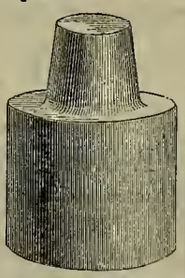
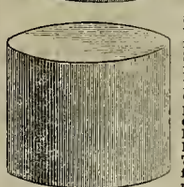
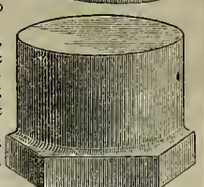
Improved Cast and Forged Steel Shoes and Dies for Quartz Mills.









[PATENTED MAY 26TH, 1874.]

Price Reduced to 16 Cents Per Pound.

SAN FRANCISCO, November 10th, 1874.

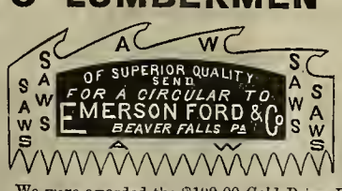
To Supts. of Quartz Mills and Mining Men generally:

We take pleasure in stating that owing to the rapid increase in our orders, our Pittsburg Manufacturers have been compelled to add largely to their works—a new gas furnace and heavier trip hammer—and are thus enabled to reduce the cost of steel and at the same time produce SHOES AND DIES superior to any yet manufactured. We have consequently reduced the price to 16 cents per pound and solicit a trial order, guaranteeing that you will find them at least 10 per cent. cheaper than the best iron. There are no STEEL SHOES AND DIES made excepting under our patent and sold at this office, or by our authorized agents, though certain Eastern manufacturers advertise STEEL SHOES AND DIES which are only cast iron hardened by the addition of a composition. They will not out-wear two sets of common iron, though called steel. They are very brittle and are not capable of being tempered, flying from under the hammer like cast iron. Our STEEL SHOES AND DIES are in use in many of the largest mills on the Pacific Coast, and all who have tried them pronounce them cheaper and far superior to iron in every respect, even at the old price of 20 cents per pound. Their advantages over iron are cheapness on first cost, increased crushing capacity, time saved in changing and in setting tappets, increased value of amalgam by absence of iron dust and chippings, and a saving of 75 per cent. in freight. It takes 50 days to fill orders from the manufactory East. Price 16 cents per pound shipped at San Francisco. Terms liberal.

Address all orders, with dimensions, to W. R. Townsend, Secretary.

1v29-3m **CAST STEEL SHOE & DIE CO., Room 4, Academy Building, S. F**

TO LUMBERMEN OF THE PACIFIC.



We were awarded the $100 00 *Gold Prize*, First Prize *Silver Medal* in the Great National Sawing Contest, had at Cincinnati, September, 1874, and *First Prize Silver Medal* for the *Best Cross-Cut Saw;* two First Prize Medals for the *Best Saw Swage* and *Cross-Cut Saw Attachment;* also the First Premium in the Great Sawing Match at the Provincial Fair, in Canada, and several First Premiums in State and County Fairs wherever any Celebrated Damascus Tempered Saws have been tested. Emerson's Patent Planer Toothed Saws for General Work. Emerson's Patent Clipper Toothed Saws for heavy feed, and our Solid Toothed Saws of all descriptions, AT GREATLY REDUCED PRICES, and sold UNDER FULL WARRANTEE. We cannot afford to make a poor saw. *Only seven days by mail from San Francisco.* Send your address on postal card for illustrated circular and price list.

VOLUME XXX Number 13.

Something About Quicksilver Industry.

[Written for the PRESS by DR. T. P. SIEVEKING.]

Since the discovery of the great quickeilver ore deposits at New Almaden, California has ocnpied often the first, and never less than the second place among the quicksilver-producing countries, and even now, whon the first mines hava greatly decreased their production, new discoveries have more than mede up for the loss.

This large production has had, as was to be expected, a great influence on the market price of the quicksilver, and in consequence has made it a necessity for the European mines, principally to try to find meana to work more economically than hefore, and to avoid the enormous losses always experienced.

The official reports of the Anstrian quicksilver mine, in Idria, where always the management haa heen in ahle and careful hands, can show best how far these losses have gone. These reports show that in the three years, 1870 to 1873, the lossss have been as follows:

1870.....46.70 per cent.
1871.....37.10 per cent.
1872.....48.25 per cent.

At tha same time the report shows that these losses are not equally reported, thera being much more in proportion lost in the treatment of poor ore than in that of rich and purer ores.

Active researches made with the purpose of finding ont where the reason for these losses lay, gave the result that it being next to impossible to graduate the temperature and the access of air accnrately enough in a large fnrnace, part of the quicksilver vapors became overheated, and expanded to such a degree that their condensation would only partially be effected. At the same time it was demonstrated that the ore, after having passed through the furnace, always retained some of the metal still, and thet a loss was caused also through absorption of qnicksilver by the bricks of the construction from which it only in part could he recovered afterwards.

Having acquired this knowledge, the crown chemist of the Anstrian empire, Mr. Patera, proceeded to make experiments tending to avoid the defects of the known processes.

He tried at first two wet processes, each of which in small scale gave very good resnlts, hut which, nnhappily, fonnd great obstacles as soon as their application in a large scale was projected.

The first process consisted in the conversion of the cinnabar nnder the action of chloride of copper into sub-chloride of mercnry, this seme being dissolved afterwards in the hyposulphite of soda end precipitated in the shape of cinnabar again, through snlphide of sodinm.

The second was fonnded on the solubility of cinnebar (very finely powdered) in a concentrated alkeline solntion of sulphide of sodium, of which an excess of water precipitates it agsin. Unhappily, both processes are very slow, demand great attention and ere rather expensive. For this reason Mr. Patera tried to improve on the performance of the old processes, and after cerefnl researches he found that cinnabar, when redneed to powder (abont the size of common sand), and exposed to the air at a temperature of ahout 950 to 1,000 degrees was discomposed entirely, and the quicksilver easily condens d.

On a large scale this process would he vsry difficnlt to manage, as the regulation of the heat would offer nearly the same difficnlty as before, and the loss would surely be considerably increased, compared with that when operating with small quantities in a laboretory. The expenses would be considerable, too, on account of the charging and discharging of the retort, reqniring many hands, and the iron of the seme heing very much corroded under the combined action of hot wet air and sulphurous vapors.

In California, since the moment when the first mine was worked for quicksilver, many experiments have been tried for the purpose of ameliorating the European proceeses. The retorting process heing slow and expensive, and demanding, moreover, a close attention, has been sparingly employed and nearly exclusively on very rich ores.

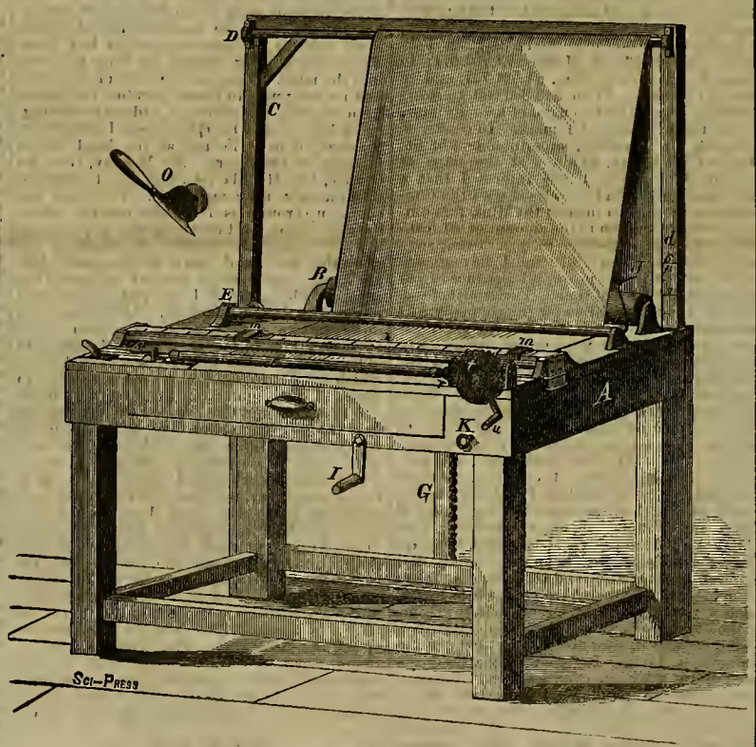
The first improvement was the Almaden furnace, which allowed to handle big quentities of ore in enormous furnaces where nnder this combined action of heat and air the reduction was effected. These furnaces, where the hot gasee from the combnstion of wood entered through pigeon holes into the closed ore chamher, and where the qnicksilver vapors went out into condensation chambers through a sscond system of pigeon holss opposite to the first, has several disadvantages. The furnace does not work continnally and hes to be cooled down every time a charge has heen burned to allow the extraction of the refuse and the recharging. Thus a good deal of heat and time is lost, and moreover, there heing a strong dreught required, the quicksilver vapors are but imperfectly condensed.

Under these circumstances it was natural that experiments were made for improvement, and that continuous working furnaces were constructed. Of theee, two different kinds have been tried and are actually in operation. The first class embraces all those where the combustion of the fnel takes place in a separate space from the ore chamber; the sscond, those where the fuel and ore are mixed. To the first the Luckhardt, Green, Knox & Osborn and Jenin processes belong. The general principle of these furnaces is the same. The ore is introduced at the top and the refuse extracted at the bottom, the ore being exposed to the action of heat while it slowly descends from top to bottom, and the qnicksilver vapors carried through a systsm of condensors by the action of a ventilator. The differences consist in the nnmber of fireplaces, the means of communication employed between tbem and the ore chamber, the regulation of air, the access, and the extraction of the vapors, leaving aside the difference of sizs as immaterial. All of these furnaces, if rightly constructed, offar nearly the same advantages and disadvantagee. They allow the working of large quentities of ore with but slight expense, and do not demand so close an attention as the retorts.

On the other hand they all have the defect mentioned above when speaking about Mr. Patera's researches. It is next to impossible to regnlate exactly the access of air and the degree of heat, and it being necessary to employ a strong dranght the quicksilver vapors are expanded to a high degree, and the condensation becomes imperfect. Moreover, in most instancss, in consequence of the want of the necessary amount of frssh air, the combnstion is not perfect and a large amount of soot is formed, of which the great amount of quicksilver it conteins, can only he partielly extracted.

Unhappily it is impossible to ascertain in California the exact loss of quicksilver, as up to the present time samples of ore have not been taken from a single establishment before nsing it, hnt it can he surmised that the loss will be very near eqnal to that experienced in Idria, as the conditions are nearly the same.

The second class of furneces as mentioned above, employ the ore mixed with the fnel (coke) and work relatively well where they are employed, but show the same disadvantages as the other kinds.



LACHMAN'S WINDOW SHADE MAKING MACHINE.

The uncertainty about the losses makes it extremely difficult to introdnce a more perfected system in this country, if the eame is new. The mines which produce a profit to their shereholders, generally content themselves with the system they employ, and are not very much dieposed to changes, while companies whose mines are not yet producing, generally dread the expense of any experiment, warned by many failures in former times. Notwithstanding, the nndersigced allows himself to call the public attention to his system, which avoids most of the disadvantages mented above, while it has the great advantage of avoiding entirely the possibility of qnicksilver poisoniog.

If cinnabar finely powdered is subjected to the action of a solution of subchloride of copper in salt water in the presence of copper, or an alloy of copper and zinc, all the quicksilver is reduced to its native state, and combines with the copper forming an amalgem of which it is easy to extract the quickeilver afterwards. Experiments made with ores from the New Almaden mine, American mine, Sulphurbank mine and Rattlesnake mine heve shown that the loss of quickeilver is very small, five to two per cent. when the ores are reduced to a fine powder. The ores are introduced in a wooden barrel, the solution ponred on it in a warm state, the copper introduced and the barrel allowed to turn for twelve hours, when, if the right conditions are observed, the process will be completed. The separation of the amelgam is afterwerds effected in the same way as in gold and silver mills.

Of the expenses of the process, the grinding of the ores and the loss of copper form the prominent items. The grindiog remains the same always, bnt the loss of copper depends entirely npon the amount of mercnry contained in the ores, and may be calculated at about forty per cent. of the weight of the aame, placing the value of copper in proportion to that of mercnry as one to four, is equal to ten per cent. of the valne of the latter.

If anybody should like further particulars, a letter addressed to Dr. T. P. Sieveking, care of Messrs. H. Walser & Co., San Francisco, will procure him all the information required.

A New Window Shade Making Machine.

The engraving on this page represents a newly invented machine for making widow shades, patented by Morris Lachman, of this city, through the agency connected with this office. It is intended for the more rapid manufactnre of window shades, such as are made of linen, and it consists in a table having upon it means for supporting a roll of the material and adjustable standards with suitable rollers by which the length of the shade is determined. A cnt-ting gauge is also so placed that as the material ie drawn through it will be trimmed to the proper width. A suitable cutter is arranged to cut off the shade, and at the aame time make the hem for it. Each shade is tacked to the permanent roller which is snpported between pivots, and by means of gearing and a crank, the material is drawn through and roned npon its roller, all ready to be removed and give place to the next.

Referring to the figure in the engraving for more explicit explanation we find, first, the table *A*. At the back of the table is a vertical moving frame *C*, which has a roller *D*, at the top. The linen passes over this roller, thence beneath the roller *E*, upon the back of the table and from thsnce to the front edge of the table where the permanent shade rollers *F*, are supported, so as to be turned to wind up the shade. *G*, is a rack attached to the frame *C*, and a pinion *H*, serves to separate it. By means of this mechanism the npper roller *D*, may be raised or depressed, and then the length from the original roll to the point where the linen is attached to the roller *F*, may be raised so as to make a shade of any desired length. A marker *J*, is arrenged so as to be operated by a handle *K*, at the front of the table. Above the linen and just back of the point where it is to be cut is fixed a trensverse bar *L*, which has a scale marked npon it. Slides *m*, move upon this bar, each slide carryir g a knife or cutter and by means of these cutters the edges of the linen can be trimmed of the selvage and cut to the proper width. At the point where the shede is to be cut off, and just in the front of the trimming knives, two or three grooves *n*, are made lengthwise of the table and transversly to the material. The cutter o, is fixed to a handle *p*, and markers are secured to this handle by the side of the cutter, so that as the cutter paeses along the groovee the marker will move in the other groove, and thus indicate the point for turning the hem. By the nse of this machine a great deal of space is economized, a matter of importance in manufactories, and the rapidity with which it performs the work for which it is intended, is simply marvelous.

THE Antioch *Ledger* says: M. D. Plummer of San Francisco, and others, have completed arrangements and are now constructing a building for the upholetering business. Experiments made have demonetrated that the tnle by a process of preparation for which these gentleman have obtained a patent, is especially snitable for this business. When prepared it much resembles hair and is tough and fibrons. Mr. Plummer informs us that he expects to place it in the market at less than one half the present price of soap-root, now some what extensively ussd.

THE first asphaltum pavement in Santa Barbara hae just beeu put down.

The Big Bonanza.

The attention of Eastern people hss of late heen attracted to the mining interests of this coast by the wonderful developments on the Comstock. So much interest hae heen manifested that the prominent Esstern jonrnals have sent relisble correspondents out to "write up" the mines. A stsff correspondent of the New York *Tribune* contrihntes to that papor of the 1st inst. a four column letter on the Big Bonanzs from which we make the following extracts:

The mines in this (Virginia) city are so marvelons in extent and operation that I should heeitate to give the facts in relation to them were they not certified hy proofs so convincing that doubt ie impossible. There is a common belief in the East that there is nothing in which such gigantic swindling is done as in mining etocke, and when the big honanza was struck I well remember the incredulity expressed on all sides. Mining to a large class of people mesns swindling, and it is not uncommon to find persons who think it ie only necessary to dig a hole in the ground, orgsnize a stock company, and hegin to sell shares in order to get rich.

This, nnfortunately, was too often the case during the oil excitement in the Venango district of Pennsylvania. Whstever mining may he in other localities, it is a stupendoue reality here, and ie carried on with the ssme precision and business ssgacity as sny legitimste manufscturing husinese in New England, New York, or New Jersey. There is no pretense, no noiee and bnetle, no pompous manifestation of wealth, no impassahle gulf betweeu the $4 miner and the twenty million capitalist. I have been here nearly two weeks, and no day has paesed during that time in which I have not visited the mines, aud each day I have seen three men, each worth not lese than twenty million of dollars, going shout qnietly among the men in the common garb of the laborer, with nothing to distingnish them from the ordinary mine hand. No diamond studs, no big rings, no finshy watch chaine, no broadcloth. Oue of these gentlemen has spent years in foreign travel, and hns mingled in polite society in other countries; another who spende most of his time in San Francisco rules the market here, and is to this coast what Commodore Vanderbilt is to New York; the other is accustomed to direct hundreds of men and employ millions of capital. Yet these threé men, when seen about their mines, would he taken for foremeu or overseers. They attend to their legitimnte business as minere and earn handsome dividends for their etockholders. These gentlemeu own a majority of the etock of the Consolidated Virginia, the California, the Best & Belcher, the Gonld & Curry, the Savage, the Hale & Norcroee, the Utah, the Occidental, and many small mines. The greatest mine in the United States, and probably in the world, is the Consolidated Virginia, the mine of the hig honanza. The figuree relating to this mine are so euormous that I ehonld not tax the credulity ot the resder if I had not examined the hooks, assessor'e retnrns, shipper'a receipts, accounts with the Government, and had the teetimony of my own senses in addition to the official papers.

A Wealthy Firm.

The Consolidated Virginia is composed of two mines—the Sides, 500 feet, and the White & Murphy, 210 feet, in all 710 feet in leugth along the lead, the width heing ae far as it extends each way, the distance not having yet heen determined, ae the walls of the mine have not been fonnd. The two companiee named were organized separately in 1859. They were worked with varying succes till ahout 1872, to the depth of abont 500 feet. The etock was on the market at this time, and four men bought the mnjority of shares, and the mines were consolidated under the name it now hears. The four men who honght the controlling interest, and yet hold it, are John W. Mackay, Jamee C. Flood, James G. Fair and W. S. O'Brien. The firm in Virginia City ie known as McKay, Fair & Co., and in San Francisco as Flood & O'Brien. Ae soon ae the consolidation had heen effected, arrangements were made with the truetees of the Gould & Curry mine to run a drift from the 1,200-ft level of their mine into the Conolidated Virginia. The drift was 1,300 feet long. Here a low grade of ore was fonnd; the vein heing eighteen or twenty feet wide, which milled about $18 a tou. A ehort distance farther, very rich ore wae reached, which milled from $400 to as high ae $1,200 a ton, and very soon afterward the miners broke through a thin film of clay, and found the bonauza, which is shaped, ae far as known, like a pocket or an egg. The bonanzae along the Comstock lode which have already been worked out were found to be of this form. As the walle of the Consolidated Virginia mine have not yet been reached, it is of course impossihle to judge of the shape. The ore is, however, known to he in a body, and not in a vein. From the time the hody was discovered it gradnally widened out on that level—the 1,200 foot—to 96 feet. The ore was followed up to the 1,000 foot level, hut never higher. Each level ie 100 feet, and after the ore has been taken out and hoisted to the top, its place is supplied with timhers iu the form of hulkheads, which prevent the mine from caving in. On the 1,200-foot level the work was oontinned down to the 1,300-foot, then 1,400, then 1,500, and finally to 1,550—the latter being for air, and also to he on a grade with the other mines.

The stock of the Consolidated Virginia consists of 108,000 shares, par value $100 each. It sells for $340 to $360 a share, and pays more dividends each year than the original par valne of the shares. Of these 108,000 shares, Mackay, Flood, Fsir and O'Brien owns 62,000. The California mine has 540,000 shares, at $100 par valne, now selliug at from $60 to $70. The firm owns 295,000 of these shares. The Best & Belcher mine hns 108,000 shares; the Gould & Curry, the same number; the Ssvage has 16,000; the Hale & Norcross, 16,000; the Utah, 20,000; snd the Occidental, 40,000. As hefore etated, the gentlemen named own the majority of the etock of all these mines. In addition, they have nine mills, which mnet be worth several millions of dollars; they own one-half of the Virginia and Gold Hill water works, cspital $5,000,000. besides flumes, factories, stocks, real estate, etc.

The Yield of the Consolidated Virginia.

The marvelous richness of the Consolidated Virginia mine can scnrcely he realized. We are so accnstomed in pnblic affaire to speak of millions of dollare with little nnderstanding of how much money it is that it hss become the cnstom to epeak thus with as little hesitation as we speak of hnndreds. I suppose that grest national hlessing—the national debt—hse made the sound ot millions familiar. A million of dollars is more money than csn he connted, dollar by dollar, in one week hy a single iudividnal, and it ie therefore imperative in dealing with the figures that a due sense of their meaning nnd importance should he considered, for in that is their only interest.

There were shipped from the Consolidated Virginia mine ahout 2,000 hars of gold and silver, nnseparated, or ahout $7,000,000, previous to the beginniug of the present calendar year. The following, which I copied from the books of the company, and verified hy bille, receipts, etc., ehows the amount of the business since that time. During the month of January, 1875, there were ehipped $1,100,697; in February, $1,200,743; in Msroh, $1,707,571; in April, $1,509,607; in May, $1,521,777, and in June, $1,503,816. From $18,000,000 to $20,000,000 a year, to he taken out of a single mine, is something worthy of remark. In conversation with Mr. Crawford, superintendent of the Mint at Carson City, who was at the mine at the same time I was, I wae informed that a ehort time ago he had a contract with the Conolidated Virginia to furnish the Mint, for coinage purposes, bullion to the nmount of $1,500,000. "It wae delivered in just twenty-one daye," said Mr. Crawford, "and I have reason to believe that it was nearly all produced from the mines during that time. The contract wae made in a very good time for the compsny. At the end of every month the mines and mills 'olean up,' that is, thoy take their machinery to pieces, take up floors, etc., and collect all the gold and ailver that may he in crevices, seams, or adhering to any portion of the mille. When they begin work again it takee some time for the amalgamating pana to fill np and begin to produce. Ae for the richnese of the mines," continued this old miner and mint operator, "there oan he no donbt. Do yon suppose theae gentlemen (meaning Mackay, Flood nnd others,) would let everyhody go down into the mine, if there was a donbt nbont it? Besides, look about you." It must he confeseed that, to all appearances, there was houndless prosperity. We were in the melting and asaay huilding. Bars of gold and silver, worth from $3,000 to $4,000 each were etacked up hy hundreds in the rooms and halle, wagons were being loaded with them, and they were thrown sbout as if they were eo many pigs of iron. In one room half a dozen men were working over as many furnaces, melting the silver and molding it into bars—very hot work. In the mine, close hy, 650 men were employ d night and day, with no Sunday play-epell. Engines, hoisting worke, maohine shops, chntes, railroads, sawmille and buildings largo enough for the world'e fair, were on every hand, in value reaching into the millions. The machinery in one mill coat a quarter of a million of dollars, and one engine in the Savage mine cost $120,000. In the Conolidated Virginia mine alone 1,000,000 feet of lumher are used every month for bulkheads, and 40,000 cords of wood are hurned in one year in the several mills and minee helonging to Mackay, Fair & Co. They have hetween 3,000 and 4,000 meu employed at an average price of $4 per day. The pay roll of one mine, which I saw myself, for the month of June, amounted to ahout $70,000. The firm paye $40,000 a quarter, or $200,000 a year, as tax on the prodnction of bnllion for one mine. The discount and express chargos on hullion to San Francisco cost the company abont $80,000 a month. The assay department, spoken of above, is ahle to melt, bar, assay, and etamp $100,000 a day in gold and silver bars in combination—the gold heing about forty-five per cent. The weight of the hars ie from 90 to 110 ponnds.

The Descent into the Mine.

The Consolidated Virginia mine is reached by a main shaft—probably 25 feet by 10. It hae no tunnels running to the enrface, because it is sitnated on level ground. The shaft, aa before stated, is now down a distance of 1,550 feet. Those not accustomed to judge of distances, had better stop and make a calonlation that will give them some idea of this diatance. The ehaft is divided into three perpendicnlar apartments about six feet hy fonr. In these the "cages" run. The cages are simply strongly built platforms, somewhat smsller than the apartment or tube in which they descend, and are covered by a honnet of iron for protection from anything falling from above. These cages—why they sre oalled cages I cannot imagine—are hoieted and lowered hy means of immense engines and machinery. This machinery—one machine for each csge—turns a wheel or drnm npon whioh a fist wire rope is wonnd. As this wheel mskes its revolutions the cage, to which the other end of the rope is attached, goes up or down, as desired hy the engineer. The machines are eo perfect in construction that the weight of a finger regulates their speed, and sends the oage whizzing through the shaft or regulates it to a five minnte trip. Each of the three hoisting compartments has three csges, one above the other. On these the ore is brought np and the empty oare are eent down. When the shifts of men take place, each of the three hoisting machines hrings np eighteen men, and when it goee down it takes the same number of fresh hands. It requires two minntes to go np or down in these cages, or jnst four minntes for the nound trip. The cagee are not like hotel elevators in any eense. In the first place they are worked by machinery that costs more of itself than ordinary hotels cost; in the next plsce they go ahont ten times ae fast ae hotel elevstors; and in the next place they have no eidee to them; no places to sit on and no lights: besides they are damp, and ss you get down very hot and disagreeahle with etesm. The precision with which they are worked ie very remarkahle, and I csnnot understand how the shaft was msde so exactly perpsndicular for 1,550 feet thst the csges do not strike the eides. Ample provision is made for eafety, so that even if the rope breaks, as it did in one of the shsfts a short time ago, the cage stops almost inetantly.

The first ehaft I went down wss the Consolidated Virginia. Adjoining the immense building which covers the ehaft and in which the machinery is, there is a hnilding nsed for offices. In the rear there is a carpeted room in which there are a hath tnh, half a hundred shoes, ae many suits of woolen clothes, eimilar to hathing suits at the seashore, and abont the same nnmher of hats—shockingly had hats. Theee enits are for visitors to wear in going into the mine. The terrihle heat of the mine and its dampness in places prevente the viciter from wearing any article of ordinary clothing. In such a snit ae I have described, I atepped on the cage, a light feeling at the head, and a jumping at the heart. Mr. Mackay, Gen. La Grange, Ben Holliday, Jr. and the foreman of the mine were my companions. The steam was oozing up around ua from the caverne helow, the cage shook a little ns each one stepped on, the bell etruck, the hand of the engineer was upon the lever, and down we dropped! Juet above our heads a stout iron bar ran across the cage. With one hand I graeped thie bar, and in tho other I held a lantern. As the cage shot down, like a cannon ball falling from a shot tower, my breath became a thing I wne nfraid of losing, and I felt a weakness nbout the lege which did not speak well for my conhidnce in them. I must confeee my head was very light, and that the hand that grasped the har was the only thing strong ahout me. Before we could bid good-hye to the light of day and the hnsy world around, we were in dsrkneea hlsok as coal. A eouud was heard above like the moving of machinery, and care filled with ore went rumbling aloug the iron floor we had left. Steam and heat came up from helow, and water dripped upon our heads from above as we shot farther and farther into the earth. Soon the sound ahove died out, a moment of silence followed, and then the noiee of engines and drille and picks cnme np to us from the hottom of the mine. A moment later, aud we felt that the epeed was leesening. The warning mark on the rope had told the engineer that the cage was almoet down. A eecond after a little bnmp wae felt, the cage stopped, and we stepped into the mine, 1,500 feet from the snrface. Time, two minntes.

In the Mine.

Here was a commodions etation, or chamher, well ventilated and etrongly timbered. It reminded me of a railroad station; the cages being cars, the miners the passengers, the ore and timber the freight. To this etation the ore is brought in care, holding 1,800 pounds. The care are puehed on to the cage, the bell is rung, and up goes the preciona freight. The air at this station was rather warm, hut it wae so much hetter than at other points in the mine that it wae a positive pleasure to return to it, after going throngh some of the drifts. In eome placea the temperature was 130°. If anyhody had told me it wae 200, I do not thiuk I could have disputed or argned the queetiou. I wae rather glad when General La Grange, in one of the hottest cross-cuts, said that hie delicate health would not admit of his going any farther. Of conrse we could not leave him, and eo we all turned hack. At the end of some of the drifts, or cross-onts, the ore, which the minere were digging ont with picks, and hlasting when it became necessary, was so hot that a person conld not rest hie hand upon it. At one place we followed the drift until we came npon the workmen, drilling and hlasting the ore which stopped the way in front. We had reached the eod. A tube of compressed air from the eurface opened at the point where these miners were at work, and yet the air waa so hot that we conld soarcely stay five minntes. The miners only stay a few minntes at a time. Fresh onee come in and take the placee of the othere. It wae at this place that I saw the working of a patent drill. A tube of compressed air furnished the motor for the drill, and it worked like a little engine. One man regulated the snpply of air and the machinery of the drill, which is so small thst a man may csrry it on his hack. Another does nothing hut pour water into the hole that is being drilled. The rock was not very hard, bnt it was too hard to work with a pick or hand-drill. The mschine went to work snd put s hole in the rock as thongh it had been chalk. It took abont fonr minntes to drill a three-foot hole, and the drill had to he changed once dnring the time. Half a dozen holes are thns drilled and loaded, snd after everybody is ont of the cross-cut they are fired off hy means of s cap and giant rowder. They open each time a fortune of wealth. The miners then go in with picks and shovels and load the cars with the ore. As esch drift advances a track is laid for the cars. After all the ore looaened hy blaets hae heen taken ont, other hlasts are made, and so mining goee on. Lnmber takes the plsce of the ore ss fast as the work proceede.

Enterprise of Miners.

In going throngh the mines miles and miles, which I did, I could not help contrasting them, at the present time, with their condition less than three years sgo. The stock was then low in price. A honanza was then unthought of. A two-compartment ehaft was down only 400 feet, and Mr. Maoksy informed me thst a little donkey engine, scarcely larger than those nsed hy threshing machines, did the whole hoisting of the mine. A board shed was in the place now occnpied by an immense hnilding, and the donkey engine has given place to a million dollars worth of machinery. When the Conolidated Virginia company took the work in hand they continned the shaft and enlarged it; they ran drifts north and south, made np raises, snnk winzes, dug croee-outs in every portion of the ore vein, and continned nntil they found the hig honanza. The present machinery and hoisting works are, ae I am informed, suffioient to sink and work the mine to the depth of 4,000 feet, inclnding what pumping may he uecessary.

My visit to the mine, as stated before, took me to the 1,500 feet level. The first thing wnnted on lsnding was drink of ice water, which was at hand, and was everywhere through the mines, and the amonnt a person will drink is amazing. We firet went sonth in the Consolidated Virginia mine 400 feet, then turning we entered cross-cut No. 4, which we followed 147 feet. Then passing cross-cut No. 3 we entered No. 2, and 324 feet of ore, a wonderful exhihition truly. In every direotion we had traversed there was ore and ore. Above our head, nnder our feet, to our right and to our left it was a continned and continuous hody of ore. We ooald not escape it. Behind ns, in front of us, nnd on eaoh hand; and when we fell in with Dr. Linderman he was half crazy with excitement. He thonght it was time to resnme specie payments, and was ready to begiu at once. A day'a experience in the minea nnder his and Dr. Rogers' inetruction makea an expert out of a novice. One comes to know very soon the difference in ores, and csn separate the good from the bad without hesitation. He may even be ahle to tell from the appearance of the chloride and sulphnret ores the amount they will mill to the ton. From No. 2 we went to crose-cnt No. 1. They are all 100 feet apart, and croes the vein or hody of ore at right angles with its course. No. 1 is the houndary between the Consolidated Virginia and the Californin minee. Nearly all the mines helonging to Mackay, Flood and their partners, connect by drifts with the Consolidated Virginia. Three hours were epent in the examination of the two mines named, and although it iuvolved travel which brought excessive fatigue, and although the heat was at timos so oppressive that it was difficult to hreathe, it wae with regret that my face was turned toward the etation late in the afternoon. We again took our poeitions on the cage. The foreman rang the bell which indicated hy three strokea that men were coming up and not ore. One stroke of the bell indicatee that the best time possihle ie to he made; two hells tell the engineer that nohody ie npon the cage, and three tell him that the freight is of human kind. So the bell etruck three—a little jerk, a snddon start, a fading away of the dimly bnrning lights, a clinging to the iron rod, darkness, eilence, and then, after a pause, bursting with the rapidity of lightning into light and life again. The clothes we wore were as wet with perapiration ae they conld have heen with water had we hathed in them. It was better than a Turkish bath and no ill effects resulted from the trip to any of us.

Market Value of Silver.

Dr. Linderman remarked, after coming ont, that he had never seen ao mnch money in his whole life, and never expected to aee eo mnch again. He will embody the resnlt of his examination in an official report to Congrese, and for this purpose he took samples of ore from every portion of the mines, and he will have them aseayed at the Carson mint. Dr. Rogere will embody the result of his examination in a report also. Dr. Linderman thinks the Nevada mines will have a great deal to do with the return to specie payments. He' eees no reason why eilver shonld not be in general circulation now inetead of small notes and fractional currency, as the low price of silver in the London market makes a greenback dollar by the qnotation worth the more by one or two cents. Silver, relatively to gold, has been gradnally sinking until it recently reached in the London market the low point of 55½ penoe sterling per

(Continued on Page 198.)

SCIENTIFIC PROGRESS.

Some New Volcanic Revelations.

The *Scientific American* summarises some new volcanic revelations as follows: The theory that our earth was successively a vaporous, a fluid and a plastic mass, which, cooling during billions of centuries, finally obtained a solid crust, in connection with the fact that during all this time she rotated round the sun and received on her equator solar heat (of which the poles were nearly deprived), leads necessarily to the conclusion that, in the neighborhood of the poles, the slowly forming solid crust must have become thicker than it is around the equator, because the solar heat was able to retard this cooling longer at the equator than at the poles. Such a crust is of course more easily perforated, by interior pressure acting outwardly, where it is thinnest; and volcanoes, which are the result of such perforation, must therefore be more numerous in the thinner places, such as around the equator, and scarce near the poles. This is confirmed by observation. Active volcanoes are not frequent around the poles; the only one near the north pole is in Iceland, while between the tropics such volcanoes are found in considerable numbers.

Another interesting consideration is that the amount of material ejected by volcanoes is enormous. The estimates of the volume of the lava ejected by Vesuvius, Etna, and especially by the volcanoes of Iceland are appalling figures; and all these masses necessarily come from the interior of the earth, and must create in the neighborhood of the volcanoes (which may be considered as safety valves) empty spaces, which are filled up by a sinking of the crust. This logical conclusion has been verified by the observation that every active volcano is situated in the center of a region of depression, and never in one upheaval, unless the material ejected by the volcano itself he so considered.

But a still more remarkable fact has been revealed by the calculations of astronomers making observations at different points of the earth's surface. It is that there are two points of depression, extending even over the ocean's surface, forming a kind of flattened poles, one the exact antipodes of the other. These points are the Antilles, in the West Indies, and the Sunda islands (Java and its surroundings), in East Indian ocean. Each region contains a greater number of active volcanoes in a smaller surface than can probably be found anywhere else on the earth. But the reason why the ocean's surface partakes of this depression, at these two volcanic centers, is as yet a problem. Modern observations have already proved many irregularities in the form of the ocean's mean level, making the ocean's surface to be far from a perfect spheroid. As this surface must, according to the laws of hydrostatics, be always at right angles to the direction of gravitation, it proves that, at various points of the earth's surface, the lines of gravitation do not pass through the same central point, even on places of the same latitude. As gravitation is a general property of matter, depending on its mass, it proves that the mass in the interior of the earth is not homogeneous nor of uniform density, and it is unequally distributed. As the interior is liquid, this distribution may be affected by cosmic influences, as for instance the relative position of the moon and planets; and any change effected in this distribution may react on the direction of gravitation on the earth's surface, and so on the form of the ocean, and thus slowly produce changes in its level, which may, in some cases, cause an apparent rising or depression of the land.

DELICATE TEST FOR THE VAPOR OF MERCURY.—M. Merget has discovered that by dissolving iridium, palladium, platinum, gold, or silver, in *aqua regia*, a reagent is obtained which is extremely sensitive to mercury, and which will, he believes, prove of great value in the solution of very many practical and theoretic problems. A paper impregnated with such a solution is marked with an indelible black stain as soon as it is brought in contact with mercury or mercurial vapor, no matter how small the quantity or how low the temperature may be. M. Merget also hopes to be able to throw great light upon the problem of a limited or an unlimited atmosphere, which was investigated without success by Wollaston and Faraday. He expects to be able to prove that mercury constantly sends forth a vapor, which ascends to the height of a mile at the rate of 550 feet per second. As a practical result of his research, M. Merget, by means of these test papers, exhibits the presence of mercurial vapor in all the workshops and warehouses where this metal is used or stored. If a workman passes but one hour in such an atmosphere, his clothing, face, hair, and beard become impregnated with mercury. If he but touches one of the prepared papers he testifies to the presence of the mercury by a well defined black mark.

RED HOT VAPOR.—The vapor of iodine may be heated to redness like a solid or liquid. It then emits the less refrangible luminous rays which furnish a continuous spectrum. A spiral of fine platinum wire is sealed in the interior of a glass tube eight millimetres in diameter. Pure iodine is then introduced, and the tube sealed after the air has been expelled. If the iodine be then volatilised and the wire ignited by a battery, the spiral appears surrounded by a flame of a very rich color which yields the well-known interrupted spectrum.

How Thunder Showers Come Up.

In order to convey a more definite idea of our theory, we will choose a certain locality which may serve the purpose of a diagram to our demonstration; and this locality shall be the region of Westfield river. This river takes its rise among the forests near the summit of the Green mountains, at a height of some 2,000 feet above the level of the sea, and, flowing southeasterly forty or fifty miles, empties into the Connecticut river about ten miles from the southern boundary of the State.

During a hot summer day the sides of the deep valley of this river reek with intense heat, and cause a flow of moist air upward toward the summit of the mountain ridge, from the valley of the Connecticut, and also from the sea. This moist air, meeting with the general current from the southwest, piles up an immense mass of cumulous cloud, of many square miles in extent. So long as the great heat lasts the cloud increases in size; grows blacker with its dense vapor, and casts a gloomy, lurid glare over the face of nature, darker than that of any eclipse. The vapor, pushed up by the ascending currents of heated air, attains to a great height above the sea, where the temperature is very low. But finally, at the hour of the afternoon when the heat begins to decline, the accumulated vapors, no longer supported or sustained by heated air from the valley below, fall in rain.—*Popular Science Monthly.*

VANILLA AS A WASTE PRODUCT IN THE MANUFACTURE OF PAPER.—We take the following interesting suggestion from a recent number of *Dingler's Journal:* In the preparation of wood pulp for paper, fine wood is treated to a solution of caustic soda under high pressure in iron boilers. After the operation the solution contains the soda salts of resinic acid, humic acid, and carbonic acid, and some other resinous bodies. In this solution the soda salt of vanilla must also be present, if it has not been destroyed by the high pressure and temperature. The presence of this body is indicated by the intense vanilla odor which always appears on treating the above liquor with acids and allowing it to stand a few days. The writer above referred to has not yet succeeded in obtaining crystals of vanillin, and hence does not describe his process in full. If any of our readers possess sufficient quantities of this lye to experiment upon, we have strong hopes that their labors will be rewarded with better success than those of our German friend, and that America will one day boast of a vanillin factory.

INTERNATIONAL METEOROLOGICAL OBSERVATIONS.—The Signal Service Bureau has just issued the first bulletin of international meteorological observations, making another step in storm science. In accordance with the arrangements made at the Vienna International Meteorological Convention, simultaneous observations are to be taken twice a month in different parts of the world. The bulletin just issued gives the results of observations at thirteen stations in Austria, one in Belgium, eighty in the British possessions, six in Denmark, thirty in the French possessions, twenty in Italy, twenty-five in Russia and 150 in the United States. It inaugurates, for the first time in history, a regular international exchange of weather reports. The object of the exchange is to render practicable the publication of a daily weather map, embracing within its limits the entire Northern hemisphere and permit the study of atmospheric movement, which, not limited to any one continent or sea, may enable storms and disturbances to be traced from wherever they arise until they disappear.

A NEW FEATURE IN TEMPERED GLASS.—It is being found that De la Bastie's glass, which is, undoubtedly, hardened by tempering, loses its molecular cohesion, under a repetition of blows, and then fractures like ordinary glass. Tempered glass, submitted to hammering, presented an appearance on fracture similar to that of *fatigue* steel, a molecular disintegration having taken place. It is feared that this alteration of structure and loss of temper may not only follow from shock, but may happen spontaneously from interior change in the lapse of time.

BLEACHING ACTION OF CHLORINE.—M. A. Boillot, in the *Comptes Rendus*, points out that the bleaching action of chlorine is not a property inherent in the gas itself, but a secondary result of its power of abstracting the hydrogen from water in organic compounds. On allowing chlorine to act on any animal or vegetable matter, it decomposes a certain quantity of water and seizes its hydrogen, forming hydrochloric acid. The oxygen set free by this reaction is transformed into ozone, which in its turn lays hold of the hydrogen present in organic matters.

A VERY HIGHLY ILLUMINATING OIL.—The *English Mechanic* gives this recipe: Pound in a mortar two ounces of camphor, slightly moistened with alcohol; add a pint of sperm oil, and stir till dissolved. Light the wick, after being thoroughly soaked, and let it burn for a few minutes; then blow out and retrim with exactness, in order to secure an even, smokeless flame, which can be better done after the wick has been slightly charred.

SCIENTIFIC BEQUEST.—The Cincinnati Society of Natural History has received an absolute and unconditional bequest of $50,000 from Mr. Charles Rodman, of that city.

A NEW EMERALD GREEN—NOT POISONOUS.—Any pigment which approaches in beauty the fearfully poisonous Paris green certainly deserves attention. One of these is said to be an hydrated oxide of chromium, prepared in a peculiar manner and known as Guignet's green. It may not be altogether innocuous; but it is, at all events, far more harmless than Paris green, or any other arsenical color. It is prepared on a large scale by fusing together, on the hearth of suitably constructed flame furnace, at a dark red heat, three parts borscic acid to one part bichromate of potash. The mass swells up, much oxygen gas is evolved, and the substance is finally converted into a beautiful green double salt, a borate of chromium and potash. By repeated washing and very fine grinding, this oxide of chromium has a most beautiful shade of color, covers well, stands the air and light and is only attacked by boiling concentrated acids. On a small scale, this green pigment may be prepared in a porcelain crucible.

ELECTRO-PLATING ON PORCELAIN.—M. Hansen has recently patented in France, the following process for electro-plating on a non-conducting material. Sulphur is dissolved in the oil of *Lavendula spica* to a syrupy consistence. The chloride of gold or the chloride of platinum is then dissolved in sulphuric ether, and the two solutions are mingled under a gentle heat. The compound is next evaporated until of the thickness of ordinary paint, when it is applied with the brush to such portions of the china, glass, etc., as are desired to be covered with the electro-metallic deposit. The objects are baked in the usual way before immersion in the bath.

DETECTION OF PICRIC ACID IN BEER.—For this Brunner recommends acidulating the beer with hydrochloric acid, and plunging therein a fragment of woolen thread, and digesting the same in a *bain marie*. After the thread is removed, it is heated with a solution of ammonia. The latter is filtered, evaporated in a *bain marie* to small volume, and a few drops of cyanide of potassium are added. The presence of 0.015 grain of picric acid in a pint of beer is determined by a red color being produced, due to the formation of isopurpurate of potash.

NOT long ago a New York lady gave $1,000 to the American Association for the Advancement of Science to expend at the discretion of a committee of the association. That committee has devoted the money to the publication of "A monogram of all that is known of fossil butterflies."

OXYVITIC ACID.—MM. A. Oppenheim and S. Pfaff announce the discovery of a new acid named as above, and having the formula $C_6 H_2 (CH_3, OH, COOH, COOH)$. It results from the action of chloroform on acetic sodic ether.

ASTRONOMICAL OBSERVATORY FOR CHINA.—The astronomical instruments sent by the French Academy to China for use at the transit of Venus, are to remain at Pekin, and perhaps a permanent observatory may be established there.

MECHANICAL PROGRESS.

HEAVY VS. LIGHT TOOLS.—The great end at which all improvements aim is the maximum of power combined with the maximum of material and weight. A man shoveling dirt with a shovel one pound heavier than it should be will lift 6,000 pounds more in a day of ten hours than he would do with a suitable shovel. All this strength is wasted. The same is true of machinery. So simple a thing as an unlubricated pulley is felt in the furnace; and the cost of the coal is augmented. Every useless pound in a truck or carriage takes vitality from the horse which draws it, and costs the owner many extra dollars for his keeping. The man who pulls an oar in the great boat races at Saratoga puts himself in training and reduces every ounce of surplus flesh. The racing horse carries not one extra ounce of fat to burden him in the effort to win. Yet workmen will carry through half their lives fifty pounds more flesh than is needed for the best working condition, a burden which tells against their efficiency and personal comfort through many years of their industrial life. These may seem little things; but whatever wastes power, increases expenses and burdens the laborer, is not a little thing.

BRIGHTENING IRON.—A Bavarian serial contains a method of brightening iron recommended by Boden. The articles to be brightened are, when taken from the forge or the rolls, in the case of such articles as plates, wire, etc., placed in dilute sulphuric acid (1 to 20), cleansing the articles, which are then washed clean with water and dried with sawdust. They are then dipped for a second or so in nitrous acid, washed carefully, dried in sawdust and rubbed clean. It is said that iron goods thus treated acquire a bright surface, having a white glance, without undergoing any of the usual polishing operations. This is a process that those interested can easily test for themselves. Boden states that the action of the sulphurous acid is increased by the addition of a little carbolic acid, but it is difficult to see what effect this can have, and it may very well be dispensed with.

TO FORM PERFECT SQUARES.—Squares can be tested with the dividers by drawing two circles, one within the other, from the same center, of sixteen and twelve inches diameter, respectively; then set the mark and the point exactly where a circle dividers to ten inches, insert one point in any of the outer circles (drawn with the dividers in this position) would intersect the inner circle; now draw a straight line through the center of the circles and through the point marked in the inner circle; and through the outer one, another line starting from the point where the dividers were inserted in the outer circle through the center of the circles, until the outer circle is reached. If this is done exactly, the points where those lines intersect the outer circle will form the corners of a perfect square whose side is 11.3137 inches. If the square is correct, it will fit the square thus formed and also the lines in the center, which divide the circle into four equal parts, and the angles must be ninety degrees. This is based on the rule for finding the hypothenuse of a right angle triangle, thus 36 square = 38 and 8 square = 64, sum 100 the square root of which is ten. This is sometimes called the six, eight and ten rule for squaring buildings.

FORCE OF THE WAVES.—The construction of marine works, especially artificial breakwaters, has led to some interesting discussions relating to the force and action of the waves of the ocean. According to French investigations, the dynamic exerted by sea waves is greatest at the crest of the wave before it breaks, and its power in raising itself is measured by various circumstances. Numerous cases have occurred in which waves have raised a column of water equivalent to a pressure of from three to five tons to the square foot. It is also proved that the velocity of waves depends on their length—waves from three hundred to four hundred feet in length from crest to crest travel with a velocity of twenty to nearly thirty miles an hour, and this, too, whether they are five or fifty feet in total height. The result of observations made on the force of waves with reference to the construction of marine works shows that such force amounts to one and one-half tons per square foot for the German ocean, and three tons for the Atlantic.

NEW ANTI-FRICTION COMPOSITION FOR BEARINGS.—A new composition, being a bad conductor of heat, is recommended by M. S. Coline a French engineer, for the bearings of all kinds of machines, wheel and axles, as not requiring any lubrication. The following is the recipe for the composition: Take about twenty-five per cent. of asbestos, and the same of plumbago, and mix them very intimately and carefully together; then add sufficient liquid silicate of soda or potash to reduce the whole to a half dry paste. The paste must then be submitted to the action of a hydraulic or other press, till it is converted into a solid mass, which is afterwards dried, either in a furnace or exposure to the air, until all moisture has disappeared. The bearings may either be turned out of the block or molded from the composition while in the moist state. When the bearing is finished it is steeped in hot melted paraffine, mineral wax, or in a solution of paraffine, benzole, or other mineral oil, until all the pores in the composition are filled up.

STEEL MAKING.—A new method of steel making has recently been patented in France, which is as follows: (1) Of employing ammoniac and carbonated hydrogen gases in certain proportions for the cementation of iron on a large scale, the gases acting simultaneously, and at the moment of their production, by the decomposition at a high temperature of a mixture of sal ammoniac and a substance supplying proto or carbonated hydrogen; (2) for the making of cast steel from scraps of iron, cemented by the process above described, and melted by the same operation; and (3) the fabrication of steel by the fusion of cemented iron sponge produced by the reduction of ores, forge scoria, etc., by means of gas derived from peat or hydrogenous matters.

AMERICAN INVENTIONS ABROAD.—Among the great American inventions, which have been adopted all over the world, are the following: 1. The cotton gin, without which the machine spinner, and the power loom would be helpless. 2. The planing machine. 3. The grass mower and grain reaper. 4. The rotary printing press. 5. Navigation by steam. 6. The hot air (caloric) engine. 7. The sewing machine. 8. The india rubber industry. 9. The machine manufacture of horse shoes. 10. The sand blast (for carving). 11. The gauge lathe. 12. The grain elevator. 13. The artificial manufacture of ice on a large scale. 14. The electro-magnet, and its practical application, by Henry and Morse.

NEW WAY TO PREPARE IMITATION LEATHER.—A substitute for leather, is described in a French journal, in which the grain of all well-known varieties of real leather is produced with great accuracy. A real skin of any desired kind is taken as a mould, and from it impressions obtained on sheets of fibrous pulp. The artificial material is cheap, strong, waterproof and not easily soiled.

PENTAGONAL WIRE.—A Belgian manufacturer, L. Chelot, manufactures five sided wire, which gives a better grip than wire with a cross-shaped section, the advantage claimed being twenty per cent. in pine and thirty per cent. in oak.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

California.

AMADOR.

THE KENNEDY.—Amsdor *Ledger*, Sept. 18: We sre pleased to learn that a large vein of fine pay ore has been struck in the extreme north end of the works in the above named mine, which bide feir to he lasting and valnable. The new strike wee made st near 1100 ft in depth, and the vein discovered being hetween 7 and 8 ft in width. The ore preeents a very fine appearence, exhibiting free gold and rich appearing eulphurets, and as far as work has progressed on the vein, it preents sll the appearance of dnrability. Evidently a chimney has been struck, which will prove of great valne to the owners of the mine. The depth at which the new vein wae discovered gives sssurence of a regular chimney formstion. The rock is that known as the ribbon rock, pecnliar to the great mother lode of the county and npon which the Kennedy is loceted.

THE LADY BENFORD. — Amsdor *Dispatch*, Sept. 18: A friend st Enterprise sends ne the following items of news from that place: Messrs. Von & Condo, the owners of the Lsdy Bedford mine, have heen at work for the lest 5 or 6 monthe einking and running a level and stoping out rock. The shaft ie 175 ft deep and the level 36 ft in length, the vein in which is 18 or 20 inches thick, and of better rock than they have ever had before; aod besides; the ledge ie more uniform in eize. They hsve taken out 125 tons of rock up to this time, and will stope out rock until the rsin sets in, when the intend to sink 50 ft more. We have 3 mille near Enterprise, sll rnn hy water, and of course we csnnot get any rock crnshed until water comes in. The owuers of the Bedford, desiring to know whst their rock would pay, built a horse arsstra and a screen to separate the cosrse and fine rock and piepare it for crnshing. They cruehed 5 tons of the rock which paid $55 per ton, and it is thought that the rock ou the dump will pay $25 or $30 per ton. A 5-stsmp mill will probably be erected in conuection with this mine.

CALAVERAS.

WEST POINT DISTRICT.—Calaverse *Chronicle*, Sept. 11: Lsst Tueeday the new hoisting works of the Cheeno mine were completed. Sinking the main shaft below water level has continued eince then, and ie apt to for some time to come. The former portable engine of the Wolverine, skillfully improved hy adding friction gear, etc., furnishes the motive power. Six years ago two Mexicans extracted some $30,000 from this vein in a very ehort time, above wster level. Through improvidence snd ignorsnce the mine has been idle until now. F. Novells & Co., of San Francieco, ownere; M. D. Baker, mine superintendent. The Champion and Josephine have heen idle for some time, ae there is not sufficient water to propel their respective hoisting worke. The beaming countenance of the commonly surly superintendent of the Mina Rica vonches for the extrsordinary favorable developmente in that mine. The main shaft is being pushed downward with the ntmost dispatch. Some 50 tons of fine ore are lying on the dump of the Lockwood. The old tnnnel of the Vslentine ie heing reopened.

GWIN MINE.—The sinking for the 1100-ft level in the Gwin mine is completed, hut owing to the fact thst the supply of water sdmite of the rnnning of only a few of the bstteries the level has not heen commenced. A powerfnl eteam engine, formerly in .use st the Petticoat mine at Railroad, hss been purchaeed snd ie now being put in poeitiou at the Gwin to he brought into requieition in caee of a failure of the water eupply in the future. The 1000-ft stopes coutinue to yield good ore and some of the batteries are kept constsntly employed.

FRESNO.

MINERAL KING DISTRICT.—Antioch *Ledger*, Sept. 18: Mr. R. Shipley returned to Antioch from the Mineral King miuee on Wednesday last, where he has been engaged eince Msy last in doing the requisite amount of labor reqnired npon hie claims. He epeaks with great confidence of the extent and richness of the district and its future promise. The preeent obstacle is the want of a road to the district from Visalia. The assays of ore are highly eatiefactory, and he ssye there is no qneetion hut the mines will prove to he all that hss been snticipated. The weather dnring the snmmer has been plesssnt, but at the time of leaving, Snnday last, the nights were oold with frost and ice. Mr Shipley speaks very highly of the New England tunnel and smelting company and says thst with proper management the company will have a valuable property. He estimates the cost of constrncting a road to the mines at $40,000. Mr. Shipley ie well know in this vicinity and is not given to exaggeration nor does he indulge in flights of fancy.

INYO.

UBEHEBE DISTRICT.—*Independent*, Sept. 11: This is the nsme hy which the new district in the vicinity of, if not including, the Rose Springs district is now known. It is the esme where Messrs. Hunter & Porter have been operating for a long time past, and where we are sstisfied from all accounte there sre numeroue silver ledges ss promising as any in the whole country. Amoog them are the Nellie Grsnt, belonging to Hunter & Porter; the Garahaldi, belonging to the Nossno Bros., snd meny others now pretty well known. Besides a fine silver ledge recently discovered by Mr. Porter, there is an immense copper ledge over 80 ft in width, and cropping holdly out for thoussnds of feet in length, lately located by Hunter & Porter and others. Mr. Porter, who ie a practical metallnrgiet, hes been experimenting considerably in reducing thie copper ore, ann is eatisfied it csn he readily and profitably smelted right on the ground. He hes now gone to San Francieco to see what can be done about erecting works for this purpose.

THE SUNRISE MILL.—Panamint *News*, Sept. 15: This mill made its second ehipment of bullion on the 11th inst., consisting of two bsrs and a fraction, valued at ahout $3,000. The hullion wae 950 fine. The ore which they are now running through the mill yields $100 per ton, a portion of which comes from a ehsft 30 ft in depth. The ore taken from thie shaft, if worked hy iteelf, wonld probably yield $300 per ton, hut ss there has been no levels rnn as yet from the shaft, they cannot teke the ore ont fast enough to snpply the mill, and the deficit ie snpplied with lower grade ore from the surfsce, thns reducing the yield to $100 per ton. This shsft hss yielded eome heantiful nuggets of native eilver, in the pset week, weighing from 1 to 3 onnces each. It is slso sbnndant in ecalee and wires of eilver, bnt eeems to he confined to a etreak of csle spar rnnning through the vein. From present indicstions thie company will be able to turn out from their mill, in the next 30 days, over $30,000, which we think is pretty good for a 5-stamp mill.

MONTEREY.

PREPARING TO WORK.—Sslinas *Index*: The Consolidated Wonder quicksilver mining company, whose minee are locsted in San Benito county, sre making preparations looking to the vigorous prosecution of work in the direction of the speedy development of their property.

NEVADA.

MINING ITEMS.—San Juan *Times*, Sept 18: The North Bloomfield Co's. mine, near Malakoff, will soon he in a situation to fully compensate its owners for the immense outlay of money expended by the compsny in openiug and developing the miue. The compsny are hard at work washing off the face of the mine for the purpose of getting down to the tunnel. The opening will he in the neighborhood of 200 ft deep, which will bring it down very nearly to the hedrock. From all indicatione, when once the indefatigable owners can get a fair chance at the immense body of gravel in sight, look ont for big psy.

The mines at Columbia hill are being worked by the Enreka Lake ditch company, which ownes pretty much all the ground, to good advantage. A tunnel, now in sbout 1,000 ft, is in process of running, which, when completed, will enable the mine owuers to wssh away the rich deposits known to exist on the hill. Owing to waut of sufficient fall, the mines csnnot he worked to advantsge. On Chimney hill the mines there are paying pretty well. Every inch of water that can he secured is nsed moet effectually in working them. Jndging from reports, they are paying well.

At Cherokee no work is going on. It is well known that the mines at Cherokee are of great vslne, bnt to enable them to be worked so as to be made to psy, a tunnel from the Badger hill side will hsve to be run so se to get st the bottom of the bssin, wherein the rich deposits are. To ruo a tunnel will reqnire a large sum of money. It is rumored that a company of capitalists is abont to be organized, to nndertake opening np these claims, which, if done, the old brisk times of onr neighboring town would return two fold. We wonld rejoice to see it.

No work is doing on the San Juan hill. All of the best mines have long eioce been washed away, snd what ground is left will not pay for working, at the present rates of water.

A FAILURE.—Nevsda *Transcript*, Sept 17: A Mr. Green wss reported to have a process for working Mesdow lake ore, which was ssid would save a very lsrge per cent. of the precious metals. Works were erected at Oseaville, and a thorough test has been made the pset snmmer, and the result has proved a fsilure, so it has been absndoned. Fryer ie the only one who can unlock the golden treasures of that district.

NEVADA MINE. — Superintendent Berry, of the Nevada mine, some time since made a contract with some mioers to take out rock on ehares. The ledge is four feet thick, is easily worked, aod the men made considerable over wages dnring the time they worked. The rock paid $19 in free gold. The same parties have taken another contrect, and feel confident of making a good thing.

NEW QUARTZ MILL.—Hamilton McCormick is erecting a mill for crnshing the quartz taken out of the ledge owned by him, near his reeidence. The ledge was discovered while piping off the surface dirt in his hydraulic diggings. The rock oo the surface was very rich, and we understand shows so well as it is sunk npon, that the owner feels justified in pntting up a mill.

KEITH'e QUARTZ MILL.—Keith has lately pnt in an eight-horee power engine, at his mill near the Plaza, for the purpoee of rnnning the mill when the water gets too low to run the same by water power. He informs ne that the mill is kept busy day and night cruehiog custom rock, most of which comes from the Gold Rnn mine on Gold Flat. We underetsnd some of the rock yields $25 per ton.

PLACER.

ST. PATRICK.—Placer *Herald*, Sept. 11: During the lsst run the St. Patrick mill crushed 430 tons of ore, which yielded 1,090 ounces of gold, or abont $17,500, a little better thsn $40 per ton.

THE Rieing Sun mine, near Colfax, recently cleaned up $11,000 after s twenty-three days' run, an average of $58.75 per ton. The lest cruehing from this miue averaged about $55 per ton, from which will be eeen that the yield of the miue ie gradually incressing.

PLACER county qnartz mines are looking up. We csn name four, at least, the Crater, the Green, the Julian and the Rising Snn, which bid fair to soon rank upon the beet in the State.

SAN DIEGO.

THE HELVETIA.—*World*, Sept. 18: The Helvetis mine of Julisn dietrict is tnrning out, at a depth of 300 ft, the finest specimen rock ever taken from the mine. Ore enough is now in eight to keep their mill running for the next two months. The mill is undergoing thorough repsirs and improvements before beginning on the Helvetia rock.

THE JULIAN MINES.—San Diego *Union*, Sept. 15: From Mr. T. L. Neemith, who hss been spending eevers! weeke at Julian, we have a good report of the outlook in our mountain region. Thst portion of our county is not only rich in mineral, but in agricultural resources. The mines are being developed with a good deal of energy by their owners. The Owens, Helvetis, and Tom Scott are sinking succesefully. The Resdy Relief and Oriflamme, when Mr. Nesmith left, were einking, and crushing sstisfectory ore. The Chariot was lying on its oars, waiting for the return of Mr. Whitney. The Stonewell was running ten etamps. The Ella mine hsd a crushing recently, which yielded $150 per ton. The Hubbsrd was crushing at the Whitney mill, with favorable results. The DeFrees mill, owned hy Count snd Messrs. Schuyler and Bartlett, was undergoing repairs and making great improvements. Mr. Schuyler is on the spot, and no doubt everything will soon be ready to recommence orushing. This mill is located in a beautiful little vslley, ahout a mile from Julian, that hss a charming stream of water running through it. There is no doubt at all that these mountains are filled with the precious metals and thst the mines will draw a large population there at no distant day. As it is, few quartz miuing regions on the coast csn present as fine a record as this. The scenery in and about Julian is charming. The sir is dry; the weather generally clesr and delightful; the water pure and delicious. The agricultural and horticultural improvements going on in the vicinity are worthy of specisl note. The vegetshle gardens are nnmerous. Mr. Wileon, in San Felipe canon, hss a fine vineyard and his grapes were for sale at the frnit etore in Julian. Mr. Brady has recently put ont an orchard near Julian; and every one whe has lately visited this region has heard of, and moet persons have no doubt seen the orchard of Mr. James Madieon, whose blackberries, peaches, apples, grapes and almond trees are a marvel. He has enceeded with his fruit trees and vines beyond his most sanguine expectations. There is good land around Julian for hundreds of theee thrifty and besutiful mountain orchards. We recommend San Diegans to visit the mining section more freqnently; they will see a rapidly growing country.

SANTA BARBARA.

IMPORTANT DISCOVERIES — Santa Barbara *Index*, Sept. 18: We have word of important mineral discoveriee in the country north of Ssnta Barbars, beyond the Nsjalsyegua and San Marcos grants, the particulars of which we will soon he permitted to give to the pnblic. The specimens shown us are strong indications of valuable eilver-bearing ledges.

SONOMA.

MINING NOTES.—*Russian River Flag*, Sept. 16: The Mt. Jackson mine is now working four gangs of men in the tunnels; sbout 300 tons of ore are on the dump; the mine is looking well; plenty of ore is in sight; the new furnace will he fired np in a few dsys. Twenty-six men sre employed. W. S. Canan, president of the company, is acting superintendent.

The Grest Eastern, adjoining the Mt. Jackson, continnes to turn ont from three to five fiasks of matal a day with its five retorts. The mine had shipped, up to lset Friday, in a rnn of forty-eight days, 226 fiasks of quicksilver, worth, st the preeent price, $12,000. Thirty-five men are employed, and 1,050 ft of tnnnel have been run. About four tons of pay rock a day are taken out. Six hnndred tons are on the dnmp. The rotary retort furnace, called the Eames & Waldbridge fnrnsce, which is being constructed adjoining the bench of retorts, hy Henry H. Eames, will make a trial rnn in a few days. The inventors claim that it will rednce ten tons of ore a day at a cost of only $2 50 a ton.

The owners of the Tiger mine, near Guerneville, have for over a year heen qnietly rnnuiog a tunnel. It will cut the ledge at right angles, and has now pierced the hill 380 ft. It is believed that the ledge will soon be tapped. The croppings on this mine are excellent and abundant.

For the week ending September 11th, the Great Western mine ahipped through Calistoga sixty-two fiasks, and the California horax company eighty-one flasks of qnicksilver.

TUOLUMNE.

THE NONPAREIL MINE.—The owners of the Nonpsriel olaim, in Deer Flat district, hsve been for the last five or six years running a tuunel in search of the mother vein. The work has been accomplished to a great extent through eolid rock, and is now completed as the vein hss been struck, paying as fully as much as was anticipated. The work of crushiog the rock, which was done at J. J. Du Prat's mill, was continued for two or three weeks, until the water running in the ditches of the Golden Rock water company lessened to such an extent that they conld do so no more. The yield, however, was perfectly sstisfactory. Work will commence again as soon as wster can he obtained.

Nevada.

WASHOE DISTRICT.

CON. VIRGINIA.—Gold Hill *News*, Sept. 16: Daily yield, 600 tons of ore. The ore extracted is, if anything, of a richer qnslity than sny thst has heretofore been extracted. The mine is looking splendidly throughout, and there appeere to he no proepect of the least cessation of the present rich yield of bullion for many months, and perhsps yeers, to come. The mills are all steadily running, and the yield of bullion will certainly not be less for the present month than thst of August, $1,650,000, Sink the C. & C. shaft is making rapid progress. The new pumping engine is about ready to steam up, which will do away with the smsll pumps and hoisting tanks and admit of a much hetter rate of speed. The hoisting engines are aleo rapidly advsncing toward completion. The frame of the hoisting works building is up and the erection of the whole rapidly approaching completion.

OPHIR.—Daily yield, 200 tons of ore. The yield of ore lset mouth gave a return of $217,000, which will be increased dnring September to nearly double that snm. This favorable showing in the yield is entirely owing to stesdy increase in the valne of the ore extracted, and it now begins to look as if it would not be long before the long cherished hopes of the stockholders would be realized, and Ophir again take her former position as a first-class dividend paying mine. This etate of affairs is greatly encouraging, and proves more and more thst, with perseversnce and a judicious investment of mesns, the return of any of the Comstock mines to the payment of dividends is only a matter of time and industry. The mine ie looking well throughout, and the ore prospects of the 1700-ft level were never more flattering than at the present time. The erection of the pnmping and incline machinery is steadily approaching completion. The new air compressor has started up, and everything is now ready to set the Burleigh drills to work in the main incline and drive it downward at a very rapid rate. In the meantime the cross-cntting of the 1700-ft level will be energeticslly prosecnted and the value of the ore vein fully developed at that point.

BELCHER.—Having a large surplus of ore on hand, tha opportnnity is being improved by the putting up of a new hoisting frame and the making of other necessary improvements. The ore bresste and stopes sre looking well throughout the entire mine, and work is progressing well on all the levels. There are no changes or new developmente to report for the week st sny point. The sir shaft is completed to the 1300-ft level.

LADY BRYAN.—Sinking the main shaft ie being pushed energetically downward, the bottom still in soft ledge matter. Driving the north and south drifts on the 380-ft level is making steady progress, bnt as each of these drifts are ontside of the ore vain and no cross-cutting has yet been done, there are no changes of intereet to report.

BULLION.—Sinking the incline goes steadily ahead without change of interest to report. The face of the main north drift on the 1700-ft level of the Imperial, is still in quartz and ore of a very encouraging character. The new combination drift on the 2000-ft level of the Imperial is steadily advancing toward the Alpha grounds.

EUROPA.—Sinking the shaft is suspended for the present, pending the putting in of a station and the starting of a drift to cross-cut and prospect the ledge. Several fine seams of qnartz were encountered near the bottom of the shaft, and there eeems to be bnt little doubt that at the increased depth, good developments will be made.

CROWN POINT.—The want of water on the Carson river is still depreciating the qnantity of ore extracted and milled. Prospecting on the 1600-ft level goes steadily on without any valnable developments to report. On the 1700-ft level nothing of valne has yet been found. The main ledge will probably soon be reached.

SAVAGE.—Drifting north on the 2200-ft level shows no changes since onr last report. Sinking the main incline is making fair progress. Sinking the south winze below the 2200-ft level is also making good headway. Nothing new of the other prospecting operations of the mine.

HALE & NORCROSS.—Driving the south drift from the bottom of the north winze on the 2200-ft level, to connect with the north drift from the 2200-ft station, is making good progress. The main west drift, on the 2200-ft level is steadily advancing.

IOWA.—The main west drift, on the 400-ft level, is steadily advancing with increasing prospects of soon developing a paying ore body. The seame and feeders of ore appear to be more concentrated and solid than heretofore. No changes in the upper tunnel drifts.

BALTIMORE AND AMERICAN FLAT.—Sinking the main incline is making excellent progress the rock in the bottom working finely. Preparations sre being made to open the ore bodies

alrssdy developed, and to commence ths extraction of ore for milling purposes ahont ths 1st of October next.

Gould & Curry.—The enlargement of ths connecting drift with the Best and Belcher on the 1700-ft lsvel is nearly completed, so that cross-cutting the 1700-ft level can be reaumad. Everything in and about the mins is again fast assnming a prosperons bnsinsss-like look.

Senator.—The gronnd in the face of the south drift, on ths 400-ft level, is still qnite soft, and requires close timbering, the lagging having to be driven in advance of the workmen in order to secnre the advancement of the work.

Dayton.—The water tank below the third station, and the lowering of tha pumps, are fast approaching completion; so that it will be hut a very few days loager before the watsr will be drained and the sinking resnmed.

Yellow Jacket.—Sinking the north and sonth winzes on tha 1700-ft lsvel show no changes of value for the week. The east crosscnt on the same level is still advancing. Everything in and abont tha mine looking finely.

Best & Belcher.—Ths oompletion of ths connecting drift on the 1700-ft level, with the Gonld & Cnrry mine, is steadily cooling ths level, and will soon put it in excellent condition for cross-cutting.

Mint.—Sinkiag the shaft is making ths usual good hsadway. Ths material penetratsd at the hottom of tha shaft gives grsat enconragement, snd the sinkiag is being pushed ahead with great vigor.

Sutro.—The flow of watsr from the face of the main wsst tunnel continues strong, with every prospect of soon reaching the ore vein. Good headway is being msds with the dritt.

Rock Island.—Still driving the main shaft downward at a very favorsble rate of progress. Nothing new to report of the prospecting opersations on the 450-ft level.

Mexican.—Sinking ths winze on ths ore vein below the 1465-ft level is making steady snd favorable progrsss. No changes of importancs in the charscter of the vein.

Amazon and Glasoow.—Sinking the main shaft is making steady and favorabls headway. It is now down ssvsnty-fivs feet below ths first station level.

Niagara & Monumental.—Sinking ths main incline is making rapid headway. The grond in the hottom is qnite soft and works well.

Sucoor.—Driving ths main west drift to cross-cut on ths 550-ft level as usual. No changss of importancs.

Knickerbocker.—The pumps are gaining slowly on the flow of water, which still continues quite stong.

Chollaa-Potosi.—Owing to a need of repsirs to the foundations of the ore dump, no ore was taken from the mine from Saturday last until yestsrday morniag, whsn the usnal mining operations on ths old npper levels were resumed. Prospecting on the 1150, 1250 and 1300-ft levels is making the usual good progress. The main sonth drifts on each of these levels ars steadily advancing to the southward, and whenever everything is is readiness, the ledge will probably hs cross-cut on each of thess several lsvels ahout ths same time. This will afford a large scope of new and virgin ground, and the indications are that some favorable developments will be made. Sinking the new combination shaft is making favorable headway. It is now down 265 ft. The erection of the new hoisting works building is fast nearing completion.

Overman.—The face of the main south drift on the 1900-ft level is in very favorable ledge matter. It hss been advanced twenty feet dnring the week. The face of the main west drift on the 1100-ft level, is in hard blasting rock, bnt is making good progress. The drift sonth from the bottom of the winze on the 1100-ft level, is in a very promising character of ledge formation, and strong hopes are entertained of finding a paying hody of ore.

Imperial-Empire.—Stoping ore between the 1850 and 2000-ft levels goes steadily ahead, the ore body opening out even hetter than was at first expected, the ore is of a good milling quality, average assays of whioh range from $60 to $85 per ton. The east cross-cut on the 2000-ft level is still hsing pushed ahead with a little more favorable proapect than at any time in the pest. Otherwise nothing new to chronicle of the prospecting operations.

Leo.—Good progress continues to he made in driving the main north drift from the bottom of the winze; it is iu a distance of 56 ft today. The ground is still quite favorable for working; it shows a little more wster, but not enough to impede explorations. The face of the drift is still in a very promising character of ledge matter, carrying veins of ore of a fair quality and other favorable indications.

Sierra Nevada.—Sinking the new shaft is making the usnal good progress, the rook in the bottom blasting out finely. The west drift, at the 1100-ft station, is steadily advancing toward the ore vein, the rock belng somewhat harder than at onr last report. The north and south prospecting drifts, on the 700-ft level of the old shaft, are still driven vigoronsly ahead without change of valne to relate.

Caledonia.—Sinking the new shaft is making good progress. The flow of water at the hottom is still atrong, bnt is kept under good control. As soon as the necessary steam pipe arrives, which will he in a very few days, the connection between the boilers and the engines will he completed and the new machinery started into fnll operation. Sinking the old incline is making good progress.

South Comstock.—The cross-out is in 160 ft to-day, running in very favorable looking vein matter. No water. Face of drift shows indications of soon rnnning into good ore next to the hanging wall. From what has been met with thns far, it is evident that planty of good psy ore might ba found concentrated at a lower level.

Justice.—The old south mine is showing considerable improvement, and good bodies of pay ors being developed which promiss to be extensive. Mors quartz is being met with in th face of the maln sonth drift of the 800-ft level, and altogether Jnstice is looking up.

Buckeye.—Still draining watsr in shaft preparatory to resume the sinking of ths shaft. The new pumps are working finely and the watsr will now soon be drained. The new hoisting works bnilding is nearly completed.

Sullivan.—Sinking the new shaft proceeds at a lively rate under the sfficient direction of Saperintendent Kelsey. Rock hard but blasting well. Grading for the hoisting works also going forward energetioally.

North Cons. Virginia.—The water tank at the 400-ft station is ahout completed, ready to resume siaking. Everything in and about ths mins is in the best of shape for good progress as soon as the pumps are lowered.

Phil Sheridan.—The erection of the new hoisting machinsry is rspidly advancing toward completion. When once in good rnnning order, soms good results may he looked for.

Woodville Cons.—Owing to a strong flow of water sinking the shaft has been suspended pending the pntting in of a tank station and lowering of the pump, all of which is making rapid progress.

Nevada.—The ore developed by ths east cross-cut from the main south drift at ths lower tnnnel lsvel sbows continued improvsment and promises to be a valuahle acqnisition.

Union Cons.—The north drift on the 1300-ft level has cut duriag the wesk ssveral feeders and stringers of rich ore with strong prospects of the development of a fine paying hody.

Lady Washington.—The chamber of the pump tank at the 260-ft level is completed, the tank put in, and on Monday next it is proposed to commence lowering the sections of the heavy new Cornish lift-pump into position. The immense new pump engine with all its powerful and massivs gearing and accompanying machinery is arriving to-day and will all be here to-morrow, ready to be placed in working position forthwith. This engine is a duplicate in every respect of that recently procured for ths famous C. & C. shsft, Virginia City, and which has besn named ths "Big Bonanza" in honor of the big bonanza far down in the howels of the earth, which it is to so powerfully assist in developing. Who knows but this twin sister to the "Big Bonanza" may develop another hig bonanza at this snd of the lead, in the Lady Washington mine. Last Thursday, just befors this ponderous bit of machinsry was shipped from San Francisco, the *Alta* says, it was inspected by a nnmber of ths leading mining gentlemen connected with ths Comstock mines, and admitted that for size and beauty of dsign, splendid workmanship and completeness of detail has never been approached on this coast. The engine is a direct actiog pumping one, of 40 diameters, 8 ft stroke, with Davey's valve gear, made from the designa of W. H. Patten, a distinguished engineer of Virginia City.

California.—The main north drift on the 1550-ft level is steadily advsncing. Sinking the winzs from cross-cut No. 3 on the north 1500-ft level to connect with the north drift on the 1650-ft level is making fair progress. It is now down 48 ft, ths bottom in ore of an exceedingly rich character. In fact as rich, if not richer, ore than any that has yet heen developed in the mine. Cross-cutting and connecting the cross-cuts, by means of lateral drifts on the 1500-ft level, is still vigorously prosecnted. The main north drift on the 1400-ft level is still pressed vigoronsly ahead toward the Ophir line, The cross-onts on the 1500-ft level are opening up fine hodies of ore, and there seems to he no let-np to the valuable developments of the mine. The erection of the batteries and pan mill is going steadily forward without interrnption; everything advancing at as rapid a rate as is consistent with the durability and perfection of the work.

Utah.—Sinking the shaft is again being driven ahead with all possible vigor. The rock in the bottom works finely, but tbe flow of water is very strong. The new pnmps ountinns to handle the heavy stresm of water with the most perfect ease, and good speed is being made. No changes of interest in any of the prospecting drifts on the 400-ft level.

The machinery in the shop of the Wilmington manufactnring company is now in splendid running order, says the *Enterprise*. Work has commenced npon plain furnitnre, and as soon as the lumher is hetter seasoned, we expect to see some specimens of handioraft tnrned ont that will make all confess that Wilmington has taken a creditable position as a manufacturing town.

The wharf is complete at Santa Monica; four miles of trsck is laid; the locomotive is being pnt together; trains will he rnnning to Los Angeles in thirty days; the telegraph line is finished; the water pipes are being laid; and a weekly paper is to he issned some time this month nnder the title of the Santa Monica *Tribune*.

Clay suitable for the manufactnre of pottery has been fonnd on the Santa Barbara islands.

It is proposed to hridge the Los Angeles river pelow the mouth of ths Arroyo Seco.

An "Editorial Excursionist" Heard From.

In a recent number of the Spriagfield *Union*, we get the first rsgular invoice of editorial correspondence from onr friends, the Eastern exonrsionists, who parted from ns in this city a few weeks since. The letter allnded to is from C. W. Bryan, editor of the *Union*. We give the opening paragraph, as expressing a very fair and correct vlew of our somewhat imperfectly understood city:

"We havs now been a week and a day in snd abont San Francisco, and the rapidly passing days and nights have been crammed full of enjoyment ln looking at soma of the most prominent features of life oa the Pacific coast. We arrived hers at nine o'clock, on the svening of Friday, ths 16th, and after one of the refreshing night's rest, which tho climats of San Francisco is so famous for furnishing, we were ready, on Saturday, to look about ths city quietly and leisnrely. San Francisco is most thoroaghly cosmopolitan, both in its population and habits of life. Nesrly all nations, trihes and kindreds are represented hsre, and tne general propensity is to "go it alone," and for sach one to look nfter him or hersslf and to leavs one's neighbors to do the same. It is hard work to find ont from one person where another ona lives or what he is doing. Inquiries at the hotel offices ars almost sure to he responded to by a frank, "I really don't koow, sir," and in the stores and shops the city directory is quoted as containiag all that is or shonld be known abont the city or its peopls."

Ths Scientifio Press, in itsa accounts of visits to Cakland and other places with the editorial excursionists, took occasion to allude to the surpriss manifested by our Esstern friends at the floral display which the country spread hefore them. It is proper now that Mr. Bryan speaks for the party throngh onr colnmns, giving their impression of California flowers:

"L'ke everybody else, I had heard much of the marvelous beauty and wealth of blossom of the flowers of California, snd although the ssason of their glory and pride is far advanced, I was not prepared to ses such wonderful sxhibitions and floral display as was spread out on all sides, upon taking a drivs into the residence portion of the city, on the afternoon of the first day of our stay here. Onr carriage load of Eastern travelers had none of them heen to ths Pacific coast before, and one might well have thought that we were all jolly gresn in the mattsr of flowers, upon hearing our exclamations of surprise and admiration, as we drove abont the city. Such fnchsias, trained up to and covering the second story windows of the houses, or standiag out in trees of many feet high, and weighted with richly colored huds and hlossoms. Snch vines of ivy geranium, one solid mass of leat and flowsr. Snoh roses of every imaginable name and kind. Such ivies, with leaves largs enongh for mother Eve to have covered hersslf with quite comfortably if they grew as large in her day. Such heds of verbenas and snch patches of heliotrope. I thonght I had seen fins spscimsns of all thess beauties before, hut I had nsvar seen anything like these, and I shall look at my own little handful of flowering plants and shrubs, which I have heretofore tended with so much gratification, as most feeble attempts at the cnltivation of flowers. A sight of the flowers of California cannot hut have the effect of seriously dwarfing the home productions of those who havs seen the floral products of the Pacific coast, at least as far as regards size of vine and wealth and profusion of hlossoms. The gersninms, which flourish equally well here with other flowers, a few of which I have named, and scores of others as rich and heantiful, not enumerated, are past their prime, and now fadiug in hlossom, bnt after a short respite, they will again renew their life when the rainy season commences, and tbns keep up their round of almost perpetual bloom aud heanty."

In a still later nnmber of the *Union* the touring editor has a long and very interesting letter devoted to an account of a visit to the mines of Virginia City, Nevada. As a mining letter it is far more appreciative than most of the correspondence of transient visitors from the East. It is perfectly candid in tone, the style is qnite attractive, and it will no doubt add much to the interest of the excellent paper for which it was written. Still some allowauces are called for when our late visitor undertakes to portray the moral, or rather the immoral aspects of a mining camp. The ways of California and Nevada miners are not the ways of the people of the farming and manufacturing districts of New England. In fact they are so dissimilar that neither is qualified to sit in judgment on the other in matters of propriety. Even California and other new country farming has been imperfectly nnderstood by Eastern agriculturists, just as *they* are misnnderstood by those of England; but mining belongs to a still farther advanced stage of pioneer life and has, accordingly, suffered even more than American farming at the hands of the semi-classio critics. We only wish our Eastern friends could have passed twelve months instead of twelve hours in one of our first-olass mining camps, so that they could have learned something of the real character of onr miners.

Instead of retaliating hy turning the magnifying glass npon the social defects of our Eastern and foreign neighhors, we will relate for their edification a circumstance which occnrred in a rnral district where we resided a good many ysars ago. An old Scotch lady called upon anothsr old lady of the same nationality, and after devoting the early part of her visit to a scrutinizing survey of her husy neighbors' ceilings, she rendered the following decision in a cool, self-sstisfied manner: "Ys dinna find cob-webs in *my* house, Mrs. Mac?" "Hoot!" exclaimed the indignant Mrs. Mac, "*I dinna come to your house to find cob-webs.*"

"Solid Silver."

Exhibit of Messrs. Schulz & Fischer.

Among ths noticeabls things to he seen at the Mechanics' Institnte Fair we mnst mention the exquisite works exhibited by Messrs. Schulz & Fiseher, which attract much attention, and furnish striking svidence of the perfection to which ths manufactures in the precious metals have been carried in this city. We have in this exhibit a union of art and manufacture; a combination of the imagining of ths artist, and the embodiment thereof hy the skilled artificer, shown to good advantage.

That which naturally first strikes the sye of the beholder is an elegant center piece, surmounted with a chased figure, and having a square foot with a satin finish. The figare supports two elegantly wrought bowls—ons on sither side, and designed for holding frnit. The piece is further ornamented on either side with figures of a dragon or sphynx.

Near this is another center piece, round in construction, ornamented on either side with a bird flying to its nest, in which are conspicuously displayed its complement of eggs. This piece has a chased foct, and stands abont eightesn inches high.

We have next a beautiful nnt dish, ornamented with silver whits water lillies, having golden stamens. Near by is seen a satin finished caster artistically engraved. There ars also shown pitchers, goblets, cups, fish knives, pie and caks knives, together with a general assortment of silver table ware.

How Such Ware is Made.

The curions observer, not acquainted with the manipulations of ths silver manufactnrer's art, is desirous to learn how such exquisite forms and tracsry are wronght out from solid silver. The modes of manufacture; the shaping of the metal; ths embossing, chasing, sngraving, etc., cannot, of course, he fully described within ths limits of a nswspsper column. A few points only can he hrought ont, from the study of which ths reader may possibly form a more or less distiact idsa of how these and similar exquisite productions are hronght out.

The stamping of a spoon, knife or fork from the rolled siver plate is readily nnderstood. The smbossing and figaring npon ths surface of such articles is readily accomplished by running thsm between properly preparsd rollers. Bnt how are these elegant centsr pieces, pitchsrs, cnps, etc. produced, whose form does not admit of their bsing thus passed between rollers.

All such pieces of silvsr ware are hnilt up in sections. The ornaments are more or less advanced on these sections before they ars soldered together; hnt ths finishing tonches are of conrse made after the form of the artiole is completed. In the varions processes of embellishment, various devices aie employed. The shape of an article is hrought out, where possible, by stamping; but when ronnd forms are desired, and those not often repested, solid wooden forms are first prepared, upon which the thin rolled sheet of metal is placed, and gradually molded into form by pressure applied hy smooth, blunt hand instruments. A lathe is used where practicable. Square and oval work is all hammered into shspe hy hand, upon iron tools.

Whenever figures are to he brought ont in relief upon articles where stamping cannot he applied, the work is accomplished hy an instrnment working hy pressure npon the inside, while tiny chisels or chasing tools are employed upon the ontside. In other words, the figures are literally hammered into shape. It is aston ishing to observe what delicate tracery and figures can be thus hrought ont. The art is a most exquisite one, and proficency therein is attained only by much practice, aided by an an artistio eye and superior skill.

When indentions alone are required, the vessel, if hollow, is filled with a composition of pitch and plaster of paris, whioh is extremely hard when cold. When thus filled, the vessel forms a slightly yielding, solid hody, capahle of receiving most delicate impressions upon its onter surface with tiny hammers and smooth, hlnnt chisel points. These operations are known as chssing and embossing, and carried on without removing or cutting away any part of the metsl.

Eograving, as well known, consists in cutting away portions of the metal by whioh certain figures are made to appear as cut into the same.

Of oourse much machinery and numberless tools, dies, etc., are called into requisition in carrying on the silver manufacturers' business. A visit to the establishment of Messrs. Schulz & Fischer furnishes abnndant evidence of this fact. It is wonderful, also, to those who can recollect the imperfect appliances of the olden time, to witness the improvements which modorn mechanism and late inventions have introduced. As an illustration, we may remark that twenty-five yesrs ago two dozen table forks, or spoons, was considered a good week's work for an expert workman, for whioh he received $12; while to-day no man would he considered a good workman who was not ahle to turn out three dozen a day of an eqnally elaborate article—an increase of 900 per cent. in tho economy of labor.

(Continued from Page 194.)

standard British ounce. The equivalent quotation in New York for fine bars is 1 21 to 1.22 per standard ounce, which is the lowest point ever reached. The price indicates that the ratio of the value of gold to silver is as 17 to 1. The price in United States gold of the quantity of bullion contained in a dollar of our new coinage is 88.0—or to state it in other terms, the silver bullion price of gold—the silver unit being 25 grains 9-10 fine—is 113.6. At the time the London quotation was made, the gold price of United States silver coin was quoted in New York at 92 to 95 cents, showing the silver coin price of gold to have been from 108.7 to 105.3, according to the fineness of the coin ascertained by the date of the mintage and also by abrasion. The greenback price of gold was quoted at the same time at 117, showing the gold price of greenbacks to be 85⅞. Since these prices existed greenbacks have advanced and silver has declined, so that the former are really at a higher rate than the latter, and it would seem that silver would prove more profitable for circulation as money at home than for use in the arts or for exportation for coinage abroad.

Orange Culture.

We devote a portion of our space this week to the valuable essay on orange culture, delivered before the Agricultural College of the University on Friday, September 10th, by our esteemed correspondent, Dr. Strentzel, of Martinez:

In treading the dim vistas of Greek mythology, he said, the golden fruit of the Hesperides captivates our attention according to our experience with the rugged climate of the northerly zone. No other tree spreads that halo of desire to roam under the shade of its umbrageous foliage, glistening with the full vigor of life, its virgin, pure and fragrant flowers, and its richly colored fruit filled with delicious cooling juice, or so vividly leads our imagination along the banks of Pharphar and Abania, the oriental abode of the blessed. California, blessed with a most congenial climate for the development of physical nature, with a soil rich in all essentials of fertility to support plant life, calls as to renewed efforts to deck every sunny nook of our favored land with this growing glory of Pomona's realm. Happily, our experience already gained, enables us to accelerate the pace of our progress in that direction, and we can proceed with magisterial perspicuity to guide the new comer in his toil.

The family *Citrus* claims her home in tropical Asia, but has spread in the wake of civilization to the other quarters of the globe with remarkable rapidity, occupying its fairest and choicest parts. To the active commercial intercourse of the Moors, at a time when other nations were sunk under the barbarism of the feudal ages is ascribed the introduction of the bitter orange into the countries bordering on the Mediterranean. Subsequently, the Portuguese, through their early communication with China, where sweet oranges were cultivated from the earliest antiquity, introduced into Portugal a successful propagation, the stock of those varieties which spread over Spain and thence were transplanted to America by the early followers of Columbus. Considering the tardy interchanges of those days, it is surprising how soon the orange took possession of the warm zone of this continent and the adjoining islands, which can only be accounted for by the inherent vitality of the plant, and its adaptation to varied climatic conditions. Thus we are justified in hoping that with the present knowledge of pomology and the facilities of disseminating valuable varieties, we shall be able not only to improve on the best now cultivated here, but to extend the area of its culture, at least, as a house plant, to every homestead in California.

Varieties of Orange Fruit.

The early horticultural writers found numerous varieties of the genus *Citrus* which they grouped under several divisions as the orange, the lemon, the lime and the citron. I feel myself justified in asserting that this family of plants claimed under the eighteenth class of Linnaeus, *Polyadelphia polyndria*, could be properly subdivided into two species, easily distinguished and identified by unmistakable characteristics. First, the orange, *Citrus Aurantium*, with dark colored, irregular serrated leaves, flowers entirely white, fruit globular, orange-colored rind, and the pulp of acidulous and bitter or sweet and spicy flavor. The essential oil contained in the leaves, fruit and rind, is easily distinguished from that of the lemon by its milder and more agreeable perfume; whereas, that obtained from lemon carries a turpentine odor. Second, the *Citros-Citrus Lemonum Medica*, or *Limetta*, with pale, green leaves, deeply, obtusely serrated and wingless, the white flowers mostly tinged with purple on the outside, the fruit oblong, the pulp pale and often insipid or acid,

Every county in California possesses bearing orange trees reported as doing well. It does not follow, however, that they can be grown profitably on any and every spot we may choose for an orangery. Favorable conditions must be considered, as shelter from heavy winds and cold currents of air, exemption from hard freezes, rich, deep, mellow soil, free from stagnant water, and also a plentiful supply of water for irrigation during the dry season. Experience and observation must be the guides in selecting these thermal spots. They abound along the foothills of the Sierra, through the central plains, and the innumerable sheltered little valleys of the Coast range, and around the bay of San Francisco.

It will be well to notice that the lemon, lime and citron are more sensitive to frost than the orange, which, when full-grown, will withstand a lower temperature, several degrees below the freezing point, if anyway sheltered afterward from the rays of the sun. If not so shaded, the sap expands suddenly in the sun heat, the bark splits along the branches, and they wither and die. In Italy and Spain young trees are planted along walls and embankments, furnishing facilities to adjust movable sheds and screens as economy may suggest, to be moved on the advent of steady warm weather. In California small trees are sufficiently sheltered by placing bushy branches of evergreens around and over them. Old grain and potato sacks will answer, or the shelter can be more ornamental as fancy or ample means may dictate. A copious showering of water at sunrise after a freezing night, is extremely beneficial in saving larger trees. Should the frost be too severe, and the foliage be killed, it is best to cut the top down at once to a point apparently sound, and new sprouts will soon renovate the tree and come into bearing. If a bearing tree is thus frost-killed, the green fruit should be gathered and dipped in water, then placed in the shade, and when dry, packed in flat, covered boxes. It will soon ripen and become quite palatable.

Protection of Orange Groves.

Noticing the beneficial effects of windbreaks—a shelter by evergreens—I have heretofore suggested the planting of alternate rows of eucalyptus, on account of their most rapid growth. This was objected to by some on the ground that the Australian giants would reach a stature of several hundred feet and smother the nurselings. That very tall and upright slender growth would be just the thing, the towering tops condensing moisture, thus counteracting sudden atmospheric changes and affording the most efficient and economical means at hand to ward off the effects of ice and frost. Some kind of shelter, either from the burning rays of the sun or a sudden depression in temperature, is recognized by every horticulturist as necessary to promote the growth of many varieties of trees, especially evergreens. The orange culturist should never omit providing ample means of protection against destructive extremes of temperature, which, though possibly occurring only at long intervals of time, are still most serious when they do happen, destroying the labor of many years in a few hours. It appears that during dry winters there are more intensely cold nights and mornings than during seasons of abundant rainfall.

The orange tree requires copious watering during the dry season. It is a surface feeder. The numerous rootlets spread in the ground, forming a spongy mass of fibers, which exhaust moisture rapidly. The curling up and wilting of the leaves denotes a deficiency of moisture, which causes also a shrinkage of the fruit. The large quantities of fruit raised on full grown trees impoverish the soil, necessitating a liberal supply of well decomposed manure. This should be applied during the winter months, thus promoting its decomposition and providing a supply of nourishment during summer growth.

A thrifty tree makes a luxuriant spread of shoots thickly covered with foliage, which afford some protection to the body of the tree during winter, so the pruning of crossing branches should be delayed until the spring growth is evolved; and on bearing trees still later, until the tiny blossom buds begin to show, that the process may be done with discrimination, saving the blossom buds and thinning out barren branches. The long thorny spikes should also be clipped off, thus avoiding injury to the fruit and promoting the growth of bearing wood in their place.

Precaution Against Overbearing.

Thinning of the fruit is often required to prevent injury from overbearing, one of the main causes of decay in lemon and orange trees alike, which shows itself at once in the topmost branches, by the leaves turning pale and yellow. The bark at the same time shrinks and is covered with discolored blotches, similar to those on overbearing peach trees, and the fruit is stunted. Such branches should be shortened in or pruned out at once, and the ground at such distance from the stem as not to injure the roots, should be loosened up with a pick or a pronged hoe and the whole surface mulched.

Profits of Orange Culture.

In locations favorable to growth and perfect ripening, the yield of fruit and its market value are almost fabulous. The Floridians claim 300 bushels and upwards to the acre—an Australian St. Michael is reputed as bearing twenty thousand oranges in a season; our growers report one to three thousand per tree. Multiply these numbers by the price according to market quotations for large assorted fruit, and the result is astounding. Good judgment and well directed labor are required to insure success, even in turning the Golden Apple of the Hesperides into drossy gold. The prize is great, but it must be won by honest toil.

General Hints on Orange Growing.

In planting, select the plumpest seed and plant it fresh in boxes with perforated bottoms, the sides about eight inches high, filled up with rich, mellow soil that will not bake, dropping the seeds five inches apart and covering them one inch. Keep the box in a warm room and the soil damp. When the young plants appear, give them plenty of air and sunshine, and sprinkle them every evening with slightly tepid water. If no frost is apprehended, and the nights are warm, keep your boxes out of doors sheltered from the winds and burning sun. The seedlings should attain the hight of twelve or eighteen inches during the season, but be not too ambitious to stimulate exuberant growth, rather shorten in, the rampant shoots and secure a stocky symmetrical growth. During the winter keep them in a dry, airy place with a temperature never under 33 deg. and not much over 60 deg., and in the spring transplant them to larger and deeper boxes. This is the time to graft them over. If you know of a tree bearing superior fruit, even if it is a seedling or a particular foreign variety from which you could obtain scions, do so at once, as these early grafted trees make a healthier and more rapid growth than those grafted when the tree is older. Except in very favorable locations the young trees should remain in boxes, the second year affording a greater facility for sheltering during the winter, and be transplanted to the open ground the third year. The distance between trees planted in a grove will be controlled by the space at command; if twenty or more feet is required in large plantations and a Southern clime—a small grove will do well if planted twelve to fifteen feet apart, as it will require ten to twelve years to fill that space. The orange is a rapid grower under favorable conditions, but may remain stationary if treated inconsiderately. Holes for the reception of the trees should be at least four feet in diameter and as many deep. The bottom of the hole, if covered several inches deep with broken bones, charcoal, etc., would facilitate drainage. Young orange trees can be transplanted at almost any time if known precautions are observed to move them with the adhering ball of earth covering all the roots; plant them about six inches higher than the surface had to allow for gradual settling of the loosened soil. Deep planting should be cautioned against, as it sickens the trees and retards their growth.

Following the general directions as here given, is all that is required to realize your dream of winning this last and best of Pomona's gifts, and the tree clothed ever in living raiment, star-decked and crowned with gold.

Taking an Advantage of Nature.

There is, in the machinery department at the Mechanics' Fair, a model of an improved derrick, though exceedingly simple in construction, is very ingenious in design. Its object is to provide means whereby the guys may be more readily adjusted, and the old laborious way of swinging the derrick more easily accomplished. By simple force of gravitation the weight becomes the means to swing the derrick.

The heel of the upright support or derrick is set on a pivot on a horizontal eccentric, so that by turning the small crank the main support is thrown slightly off the center and the weight on the pulleys naturally seeks the lowest place. By this means after the weight to be moved is raised from the ground on the derrick arm, by throwing the support one way or the other off the center, the load swings to the lowest point by force of gravitation. In this way the force of nature is taken advantage of and the load deposited in any direction.

This improvement may be applied to any derrick now in use, and will facilitate the labors of quarrymen, foundrymen, bridge builders and all interested in the use of derricks and cranes. The man who rases the load with the windlass also moves it to its position without leaving the windlass, so there is no necessity of any one going under or near the weight to move it. With the old style arrangement the guys were always troublesome. As the load was moving round the strain on one guy would be suddenly transferred to another with a surge, which oftentimes, with a heavy weight, would pull the whole structure down. In the case of this arrangement the strain is gradually and slowly transferred from one guy to another, there being no possibility of the load swinging otherwise than directed by the movement of the crank which operates the eccentric.

TEACH BOYS THE USE OF TOOLS.—It is to be regretted that there are not schools to teach boys the initial principles of working hand tools, since this knowledge is essential to the proper understanding of how to use them. Simplicity in the form of an implement by no means implies facility in its use; indeed, it may be said that the more simple the tool, the greater is the skill required to use it properly and with maximum effect. Not every operator excels with pocket knife, axe, or saw; and, with the use of every tool, there is involved the demonstration of a definite principle.

THE enormous locomotive, "Modoc," on the Pennsylvania road, which is capable of drawing eighty loaded cars over the average grades of that road, has been eclipsed by another engine lately finished for the same road which is seven tons heavier and is believed to be equal to hauling one hundred cars with average loading.

ANCIENT MACHINERY.—One of the latest discoveries in Pompeii is a small woolen factory, situated near the house where the fresco representing Orpheus was recently discovered. Several charred fragments of tapestry were found in this place, besides various machines for carding and weaving wool.

Machinery at the Mechanics' Fair.

Among the largest contributors at the Mechanics' Fair, in the line of machinery, are Messrs. Gregory & Co., and they deserve special mention for the interest they have taken in the success of this Exposition, and for their fine exhibition of machinery which occupies so important a position in this development of the interests of our coast. The wood working machines, several of which are in operation, are manufactured principally by Messrs. J. A. Fay & Co., of Cincinnati, Ohio, who are said to stand at the head of the list in their specialty. This progress which they have made in the last few years is certainly wonderful. Compare for instance the old fashioned fort mortiser, or the more recent but still crude power machines, with the beautiful compound bed automatic reverse motion machine on exhibition. The Pacific planer and matcher—a machine made expressly for use on this coast, and calculated to work rustic and stick mouldings if required—deservedly attracts much attention. It is to be regretted that lack of space prevented Messrs. Gregory & Co. carrying out their original intention to exhibit *all* of their machines in operation. This new moulding machine seems to possess many points of excellence over similar machines of other makes, and the regret is universal among mechanics that it is not in operation.

We note great advancement also in the other sash, door and blind machines exhibited by the same manufactories. The sawing machines of various kinds in which Fay & Co. have always maintained a supremacy, seem as near perfection as possible. The new machine called the "Wood Worker," seems capable of an endless variety of work, and is particularly adapted to planing out of wind, surfacing straight or tapering work, rabbeting door frames, etc., rabbeting and facing inside blinds, jointing, beveling, gaining, chamfering, plowing, making glue joints, squaring up bed posts, table legs, newels, etc., raising panels either square, bevel, or O. G., sticking beads, working circular molding, ripping, cross cutting, tenoning, etc.

The exhibition of Tsnite emery wheels and machinery by the same firm is also interesting. The emery wheel within the past few years has worked an entire revolution in the foundry and machine shop, the file in some instances having almost become a thing of the past. They are also rapidly making a place for themselves in the saw and planing mills. They may truly be called labor saving machines, and ere long will occupy a prominent position in every shop worthy of the name in the country. The Sturtevant blower, the pioneer among fans, still keeps up its ancient reputation for efficiency and noiselessness; besides the No. 8 on exhibition with the rest of the Messrs. Gregory's machinery, one of the smaller sizes may be seen further down the hall driving the large Turbine windmill, which in turn drives two force pumps. Walking down among the pumps, we find a fine assortment of Blake steam pumps also exhibited by H. P. Gregory & Co. We note particularly a large double acting plunger mining pump, 20 in. steam cylinder, 10 in. plunger, and 24 in stroke; this pump did not arrive from the East in time to be put in operation. The removable cylinder mining pump, also attracts its share of attention as well as the large fire pump in operation; although at present discharging through a 3 in. nozzle through but one of its outlets, it is capable of throwing four powerful streams simultaneously.

We understand there is to be a test of steam pumps before the close of the Fair, to be conducted by a committee of scientific and practical engineers. This is as it should be, for without such a test no satisfactory determination can be arrived at as to their respective merits. The tests should be thorough and exhaustive. The people of this coast, who are such extensive users of steam pumps, have the right to know what they are buying.

The Blake steam pump is made specially for miners' purposes, and is so well known on the coast as to need little description from us: the novelty in this pump is the removable water cylinder. In places where space is so limited as not to admit of a plunger pump being used a piston pump is the only substitute. Owing to the gritty nature of mine water, objections have been advanced against the use of piston pumps, on account of the rapid destruction to which the cylinders are subjected; thence the introduction of a removable cylinder that may be detached from the pump, almost instantaneously, without disturbing any other part of the pump—a matter of vital importance, when a pump in a mine cannot be stopped more than half an hour without flooding the gangways and resulting in heavy loss. With one of these pumps supplied with a duplicate cylinder a mine is safely protected against such disasters. Any sized cylinder may be used in this pump—as an illustration: as a shaft is deepened it becomes necessary to increase power, which may be readily accomplished by reducing the diameter of the pump cylinder. By the use of this patent cylinder a 14 inch cylinder may be reduced to 4 inch, or any desired diameter in a very few minutes. Each part of these pumps being manufactured to a uniform guage enables the ready substitute of a new part in the place of one that has been injured or worn out.

THERE are twenty-three miles' length of pneumatic tubes now in operation in London, used for sending telegraph messages.

Useful Information.

Fifty Dollar Recipe for Tanning Fur and other Skins.—Remove the legs and useless parts, soak the skin soft, and then remove the fleshy substances, and soak it in warm water one hour. Now take for each skin, borax, saltpetre and Glaubersalt, of each one-half ounce, and dissolve or wat with soft water sufficient to allow it to be spread on the flesh side of the skin. Put it on with a brush thicker in the center or thickest part of the skin, and double the skin together, flesh side in; keeping it in a cool place for twenty-four hours, not allowing it to freeze. Then wash the skin clean, and take sal-soda, one ounce; borax, one-half ounce; refined soap, two ounces; melt them slowly together, being careful not to allow them to boil, and apply the mixture to the flesh side as at first. Boil up again and keap it in a warm place for twenty-four hours; then wash the skin clean again, as above, and have saleratus, two ounces, dissolved in hot rain water sufficient to well saturate the skin; take alum, four ounces, salt, eight ounces; and dissolve also in hot rain water; when sufficiently cool to allow the handling of it without scalding, put in the skin for twelve hours; then wring out the water and hang up for twelve hours more to dry. Repeat this last soaking and drying two or three times, according to the desired softness of the skin when finished. Lastly finish, by pulling and working, and finally rubbing with a piece of pumice-stone and fine sand paper. This works like a charm on sheepskins, fur-skins, dog, wolf, bear-skins, etc.

The Silk Harvest of the World.—According to a report, just published by the Syndicate of the Lyons union of silk merchants, the silk crop of last year was, in round numbers, 9,050,000 pounds of raw silk, while there were exported from Asia 11,500,000 pounds, making upwards of twenty and a half million pounds of raw silk available for European consumption. The countries included in the report are Italy, France (with her dependencies, Corsica and Algeria), Spain, Greece, the Turkish Empire, Georgia, Persia, India, Japan and China. The first and the last together supply four-fifths of the silk used in Europe. China, exported, chiefly from Shanghai, upwards of 8,000,000 pounds. The crop of Italy amounted to 6,300,000 pounds. France supplied 1,600,000 pounds; Spain, about 310,000 pounds; Greece less than 30,000 pounds; the Turkish Empire, 1,180,000 pounds; Georgia and Persia together, 880,000 pounds; India (from Calcutta), 935,000 pounds; Japan, something over 1,200,000 pounds.—*Scientific American.*

An Ancient Tunnel in Algiers.—Several civil engineers, engaged with the surveya for a water conduit from Touja to Bougie, have made a very interesting and important discovary. A mountain which was situated in the proposed line of the conduit was to be tunneled for a length of 500 yards; and in searching for the most suitable place the engineers discovered an ancient tunnel six feet eight inches in hight, and nineteen feet eight inches in circumferance. It is supposed that this is the same tunnel mentioned in an epigraph found at Lambaec, according to which the tunnel was built in the reign of Antonins Pius, the plans being proposed by a veteran of the Third Legion named Nonius Datus. Finding works like this after a time of two thousand years, we cannot but be greatly astonished at the power, energy and genius of a nation which produced, with the limited means available at those times, such gigantic structures.—*Stummer's Ingenieur.*

An Easily Made Ice Box.—To make a cheap refrigerator, procure two dry goods boxes (or make them), one about eight inches smaller than the other. Procure some thoroughly dry and clean sawdust, sift it and pack the space between the boxes therewith as solid as possible, making a cover (and packed it also) to shut tightly; put a small pipe from the bottom of the inner box to the outside of the outer one, to draw off the water as the ice melts. On the inside box nail cleats on which to place racks made of lath. The ice is placed at the bottom, and whatever you wish to keep cool, such as butter, fresh meat, cream, etc., is placed upon the racks. Such a box is also excellent to keep articles of food in when there is no ice in it.

To Prevent Splitting of Handles.—All carpenters know how soon the butt ends of chisels split, when daily exposed to the blow of a mallet or hammer. A remedy suggested by a Brooklyn man consists simply in sawing or cutting off the round end of the handle so as to make it flat, and attaching by a few small nails on the top of it two round disks of sole leather, so that the end becomes similar to the heal of a boot. The two thicknesses of leather will prevent all further splitting, and if in the course of time they expand and overlap the wood of the handle, they are simply trimmed off all around.

An Example Worth Following.—Last fall twenty young men and woman of Springfield, Mass., who wished employment, associated themselves together, paid in a small capital, hired a workshop and boarding house, and began manufacturing toys, table mats and baskets. They laid aside one-fourth their wages to accumulate as capital, and in six months saved $1,427 from their wages and $350 in board and washing, making a total saving of $1,874 by this system of self support.

Wonderful Shooting by a Japanese in England.—One or two anecdotes about the wonderful Japanese marksman at Wimbleton may be selected from the vast number which are going the rounds. At Hythe, Major Muretta was pitted against one of the most celebrated musketry instructors in the camp, an officer who can, to use a familiar phrase, "face the target," that is, can say where he is going to place his shots, and then do it. The Japanese major saw everything that the English lieutenant was able to perform, and immediately proceeded to cut him out in a manner that amazed all beholders. At Ash, near Aldershot, he was purposely misinformed as to the distance of a range, the number of yards being given him as 800, whereas in reality it was 1,000. Major Muratta said nothing, but calmly sighted his rifle, and firing, hit the bull's eye. This he did again and again, and when he was told that he had been deceived in the distance, his reply was that he had not been deceived at all.

Chinese Ingenuity.—The Chinese take a curious method to prevent their pigeons from being attacked by birds of prey while circling over the cities or moving from place to place. This consists in the employment of small, short cylinders of reed pipe, in groups of three or four, or more. These are attached to the back of the bird, and so adjusted that as it flies through the air a very sharp sound is produced. Varying lengths of the bamboo give variety of tones to this instrument; and when large numbers of birds are flying together in a flock, as is frequently the case, the sound produced by them is distinctly audible for a great distance. It is said that rapacious birds are effectively repelled by this precaution, so that the pigeons make their flights with perfect safety from one point to another. Varnish is used for coating these bamboo whistles to protect them from moisture. This practice is said to have been in vogue among the Chinese for a great many years.

Farmers' Paint.—Farmers will find the following profitable for house or fence paint; skim milk, two quarts; fresh slacked lime, eight ounces; linseed oil, six ounces; white Burgundy pitch, two ounces; Spanish white, three pounds. The lime is to be slacked in water, exposed to the air, and then mixed with about one-fourth of the milk; the oil in which pitch is dissolved to be added, a little at the time, then the rest of the milk, and afterwards the Spanish white. This is for white paint. If desirable, any other color may be produced; thus, if a cream color is desired, in place of part of the Spanish white use the ochre alone.

Copper Amalgam which Adheres to Glass or Porcelain.—To produce this take from twenty to thirty parts of copper in powder obtained from the oxide, either by means of hydrogen or by precipitation of the sulphate with the aid of zinc; mix this with sulphuric acid and with seven parts of mercury, and mix all together with great care. The acid must then be washed away with hot water, and the amalgam be allowed to dry. At the end of ten or twelve hours the mass will be sufficiently hard to take a brilliant polish. We are told that while the amalgam becomes soft with heat, it does not contract from the effect of cold.

Good Health.

Learn about the Pulse.—Every intellectual person should know how to ascertain the state of the pulse in health; then by comparing it with what it is when he is ailing, he may have some idea of the urgency of his case. Parents should know the healthy pulse of each child—as now and than a person is born with a peculiarly slow or fast pulse, and the very case in hand may be of that peculiarity. An infant's pulse is 140; a child of seven, about, 80; and from twenty to sixty years it is 70 beats a minute, declining to 60 at fourscore. A healthful grown person's pulse beats 70 times in a minute; there may be good health down to 60; but if the pulse always exceeds 70, there is a disease; the machine is working itself out; there is fever or inflammation somewhere, and the body is feeding on itself; as in consumption, when the pulse is quick—that is, over 70, gradually increasing, with decreased chances of cure, until it reaches 110 or 120 when death comes before many days. When the pulse is over 70 for months, and there is a slight cough, the lungs are affected.

Inoculation for Bee Stings.—Mr. G. Walker gives an interesting account in the British *Bee Journal*, of a series of experiments on inoculation by bee poison. The method of procedure was to permit a bee to sting him on the wrist, care being taken to obtain the largest amount of poison. On the first day this operation was performed twice. The effect was a severe superficial erysipelas, with the ordinary symptoms of inflammation. After a few days, these symptoms having disappeared, he caused the insect to sting him three times in quick succession. Though the erysipelas inflammation was not so severe, a stinging sensation extended up to the shoulder, and an enlargement of lymphatic glands in the neck showed that the poison had been absorbed into the system. A few days after wards he again received three stings, which were attended by symptoms of less intensity. After the twentieth sting, there was only a slight itching sensation for a short time in the immediate vicinity of the wound, and the effects of the inoculation appeared to be satisfactory.

Beans in Punctured Wounds.

A physician in Lynn, Mass., having been asked his experience in the treatment of punctured wounds, thus gives it in the *Medical Investigator*:

More than thirty years ago, when the writer was a little lad, he was standing upon a load of hay, fork in hand, when the horses gave a sudden start. I made a violent effort to prevent falling off the load, and in so doing drove the tine of the fork into the top of my foot. The boot at the instep was cut open, so the foot received the whole force of the blow. It was a bad wound. My father feared I would be a cripple. One of the laborers was a backwoods man, a sort of a botanic doctor, who agreed to cure me that day, and related the following case as a comforter: "Last year I saw a man fall from a load of hay, fork in hand. The handle of the fork stuck into the ground, and one tine through the man's thigh, suspending him from the ground. He was taken off the fork, carried to the house, and a common white bean split open and the flat side of each half bound dry upon either wound. The man could walk the next day; and in one week was again at work in the field." I was was placed in bed, a bean split open, and one-third bound dry upon the wound. For an hour I was still with pain (I was actually crazy), but finally went to sleep, and after about two hours of sleep awoke, with the foot well.

The cases from practice under my care are as follows: Miss ——— was running across the garden, in the spring, when she stepped upon a garden (iron-toothed) rake which had been housed under the snow, running one tooth through her shoe and great toe, splitting the nail both ways. It was removed, the wound washed, and the half of a bean bound upon the top and bottom of the toe, and she kept about her work every day, though all her friends were sure she would have "lock-jaw."

M. stuck a rusty nail into the bottom of his foot. Two hours later I saw him, with his foot very painful, top of foot badly swollen, and he was having frequent chills. I gave him some remedy, cannot tell now what, and applied the split bean. For several hours he was almost wild with pain, but he went about his business three miles from home next day, and had no more trouble. I might relate other cases, but wait for others.

Reducing Obesity.—M. Philbart, a French scientist, proposes an improved system of reducing obesity, the basis of the regime resting on the prevention of the introduction of carbon into the body, or on favoring its transformation, and augmenting the amount of oxygen; the food, therefore, to be non-nitroganous, varied with a few vegetables containing no starch, and some raw fruit. The temperament of the patient is also to be kept in view; the lymphatic to have a red diet, such as beef, mutton, venison, bare, pheasant, partridge, etc., and the sanguine a white diet, like veal, fowl, pigeons, oysters, etc. Vegetables not sweet or farinaceous, are allowable; also grapes, gooseberries, apples, etc., but sugar, butter, cheese, potatoes, pastry, rice, beans and peas, are prescribed. The hygiene consists, in this system of treatment, in favoring the action of the skin, in wearing a tight roller to support the walls of the abdomen, in taking plenty of exercise on foot or on horseback; also playing at billiards, fencing, swimming, gymnastics and kindred diversions. In some slight respects only does this method of M. Philbart differ from others brought forward of late years, but great merit is claimed for it.

Cure for Ivy Poison.—The Ohio *Farmer* has this cure for ivy poison: It is to dissolve sugar of lead—a bit the size of a hazlenut—in half a teacup of sweet milk or warm water. Apply as warm as can be easily borne with a soft, linty rag. Three or four applications are sufficient to effect a cure. If the poison is on the face and nearing the eyes or mouth, this astringent wash may be constantly employed. It is a marvelous cure, and by watching closely one can see the fevered blisters turn white to yellow during the application. This remedy for ivy poison should prevent a great deal of suffering. It is well where a member of a family is easily poisoned, to keep sugar of lead in the house all the time. Let it be labeled and kept where it can be found the moment it is wanted. Keep it well wrapped up, that it may not lose its strength.

The anæsthetic effects of alcohol are sometimes manifested in a surprising manner. An old case is that of a drunken man who lay down near the top of a lime kiln, with one foot resting on a lump of lime stone. The fire crept through the furnace until his foot became a blackened cinder, but his sleep was not interrupted, and the first intimation he received was when he awoke at daylight and attempted to stand. Lately a similar circumstance has been reported from England. A drunken man laid down before a fire and remained there until the front part of his body was literally roasted. He died in a few hours after being found.

An English life insurance company has kept a record of the mortality between teetotalers and moderate drinkers, and ascertained that the mortality of the former class was twenty-six and one-half per cent. less than among the latter.

Domestic Economy.

Condiments—What are They.

According to Dr. Lethehy, "they are mainly stimulants of the digestive organs, promoting the flow of saliva, gastric juice and other intestinal secretions, and increasing the peristaltic movement of the viscera. Thus they aid in the processes of digestion, and by giving flavor to the food they whet the appetite and so increase the relish for it. Food is made more palateable, and digestion promoted."

Many eschew condiments entirely, and to manifest advantage. William Cullen Bryant, in a letter published a couple of years ago in the *Herald of Health*, said: "Even with my food I do not take the usual condiments, such as pepper and the like."

They contain no nutriment. Where used, they should be free from adulteration, of the best quality, and of the finest kinds. Pot herbs are often used for condiments, especially for broths and soups. The best of condiments used in moderation are doubtless useful, though not essential to high health. Flint, in his great work on physiology, says of them: "The refinements of modern cookery involve the use of articles which cannot be classed as alimentary principles. Pepper, capsicum, vinegar, mustard, spices, and articles of this class, which are so commonly used, with the various compound sauces, have no decided influence on nutrition, except in so far as they promote the secration of the digestive fluids. * * * The various flavoring seeds and leaves, truffles, mushrooms, etc., have no physiological importance, except as rendering articles of food more palatable."

In addition to the above we give the following from Prof. F. W. Newman. It appears in a recent number of the London *Dietetic Reformer*. "In the writings of several leading vegetarians is it noticeable that they profess to take no condiments but salt. Mr. G. Dornbusch does not even take salt. I feel that this subject needs more light thrown on it. Salt being a mineral seems, at first sight, to need a justification. I find it in the fact that horses and cows love grass which has a taste of salt, and the American bisons make long pilgrimages to lick the salt rocks; it is a notorious fact that it kills worms in children. Hence it may be inferred that a certain portion of it is healthful, and preservative from ailments. When instinct and common sense point to a conclusion it is satisfactory to have corroboration from science. And here we find that the gastric juice is reported to us as containing muriatic acid, for which salt, being muriate of soda, gives a supply. Besides, salt is one of the ingredients of blood. Thus salt is really food, though any excess of it is of course mischievous.

"But that vegetarians should sweepingly renounce *vegetable* condiments comes to me as a paradox. So much of condiments as tends to thirst I warmly deprecate, and with difficulty hear a very minute taste of cayenne pepper or curry. But are we to forswear mint, sage, mace, cloves, cinnamon, caraway, ginger, pepper and all spices? Where shall we stop? What of mustard and cress, and watercress, celery, orange and citron peel? As a special example, rice is so tasteless that the hardiest rustics (Turks and Arabs) reject it unless some condiment be added. Salt and butter are their ordinary demand, and they call it *pilau* (pronounced *pilow*). The English generally expect milk with it, or milk and sugar. All watery vegetables seem to need *some* condiment. Salt may suffice, but it is difficult to understand why other tasty articles are to be banished from our tables."

Egg Preserving Pickle Recipe.—An agent of the Scientific Press reports the following: Three quarts lime, tablespoonful cream tartar, one cupful salt and water enough to fill a five gallon tin can, after seventeen dozen eggs have been carefully placed within the can. To the water add the other ingredients, stir up well and pour it on the eggs and keep them in a cool place entirely covered by the pickle.

The lady subscriber who furnished the above keeps her eggs perfectly sweet with the above treatment, and by special request, after writing the above recipe, she boiled me an egg that had been in pickle four months, and I found it perfectly sweet and free from all shadow of taint or any objection of any kind, and would trust them fully as soon as the freshest eggs in any of our markets. She usually gets the highest price of fresh eggs, and does not sell till they are about fifty cents a dozen.

Cooking Okra.—Have ready two quarts of good beef stock; cut up one quart of tender okra, two quarts of tomatoes after they are skinned, half-pint of lima beans, half-pint of corn cut from the cob or grated, one or two carrots cut into small pieces or grated, an onion, if desired; season with pepper and salt; a few cloves some think an improvement. Let it boil for an hour and a half, stirring frequently. Just before serving thicken with a tablespoonful of flour and one of sugar. If the stock is not rich, add a lump of butter. The okra, tomatoes and carrots should boil the longest; chop up a handful of parsley and put into the tureen before serving.

Boiled Grape Juice.—The syrup resulting from boiling down grape juice will keep well and is very palatable. It can be used to great advantage with stewed fruits and preserves.

MINING AND SCIENTIFIC PRESS.

W. B. EWEB.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY, W. A. EWEN, GEO. H. STRONG JNO. L. BOONE

Office, No. 224 Sansome St., S. E. Corner of California St., San Francisco.

Subscription and Advertising Rates:

ADVERTISING RATES.—1 week.	1 month.	3 months.	1 year.
Per line.....	.25	.80	$2.00	$5.00
One-half inch.....	$1.00	3.00	7.50	24.00
One inch.....	1.50	4.00	12.00	40.00

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper inserted at special rates.

SUBSCRIPTIONS payable in advance—For one year, $4; six months, $2.25; three months, $1.25. Remittances by Registered letters or P. O. orders at our risk.

Prompt Subscriptions.

We wish to thank those subscribers who send in their renewals to the PRESS promptly as regularly as the year comes round. It saves us much expense in commissions for collections and renewals. May we not request more of our good patrons to do so!

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus and terms of subscription.

San Francisco:

Saturday Morning, Sept. 25, 1875

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Something About Quicksilver Industry; A New Window Sash Making Machine, 193. Rich Strike in the Carson Melone's Mines; Notice of Recent Patents; Peat as Fuel, 200. Vulcanized Rubber Fabrics, 201.

ILLUSTRATIONS.—Lachman's Window Shade Making Machine, 193. A New Method of Determining Positions of the Sounding Boat, 201.

CORRESPONDENCE.—Metallurgy of the Copper-Silver Ores of Inyo Co.—No. 4, 200. A New Method of Determining Positions of the Sounding Boat, 201. An Immigrant Depot; Patents and Inventions, 204.

SCIENTIFIC PROGRESS.—Some New Volcanic Revelations; Delicate Test for the Vapor of Mercury; Red Hot Vapor; How Thunder Showers Come Up; Vanilla as a Waste Product in the Manufacture of Paper; International Meteorological Observations; A New Feature in Tempered Glass; Bleaching Action of Chlorine; A Very Highly Illuminating Oil; Scientific Bequest; A New Emerald Green—Not Poisonous; Electro-Plating on Porcelain; Detection of Picric Acid in Beer; Oxuvitic Acid; Astronomical Observatory for China, 195.

MECHANICAL PROGRESS.—Heavy vs. Light Tools; Brightening Iron; To Form Perfect Squares; Force of the Waves; New Anti-Friction Composition for Bearings; Steel Making; American Inventions Abroad; New Way to Prepare Imitation Leather; Pentagonal Wire, 195.

MINING SUMMARY from the various counties in California and Nevada, 196-7.

USEFUL INFORMATION.—Fifty Dollar Recipe for Tanning Fox and Other Skins; The Silk Harvest of the World; An Ancient Tonnel in Algiers; An Easily Made Ice Box; To Prevent Splitting of Handles; An Example Worth Following; Wonderful Shooting by a Japanese in England; Chinese Ingenuity; Farmers' Paint; Copper Amalgam which Adheres to Glass or Porcelain, 199.

GOOD HEALTH.—Learn about the Pulse; Inoculation for Bee Stings; Beans in Punctured Wounds; Reducing Obesity; Cure for Ivy Poison, 199.

DOMESTIC ECONOMY.—Condiments—What are They; Egg Preserving Pickle Recipe; Cooking Okra; Boiled Grape Juice, 199.

MISCELLANEOUS.—The Big Bonanza, 194-98. Orange Culture; Taking an Advantage of Nature; Teach Boys the Use of Tools; Ancient Machinery; Machinery at the Mechanics' Fair, 198.

NAVAL ARCHITECTURE AT THE SOUTH.—A ship of upwards of 1,400 tons is being constructed at Charleston, South Carolina—a before unheard of event. The introduction of manufacturing industries and the mechanic arts is the lever which alone can lift the South from its present state of depression, and place it on the same plane of prosperity as that occupied by the North. This fact is now being universally recognized by our Southern brethren, and they are wisely directing their energies accordingly.

A SECOND bridge across the East river from New York to Brooklyn has been authorized. The bridge will be divided into two spans—the central pier resting on Blackwell's island. The largest span of this bridge will be but 800 feet—just half that of the bridge from the Park.

THE stock of oil in the Pennsylvania producing region, July 31st, was 4,386,720 barrels, against 4,502,896 barrels on June 30th—thus showing a very even production and no foundation for the late attempt to "bear" the market.

A MINING BOARD FOR NEW YORK.—Strong efforts are being made to organize a mining stock board in New York. The people of that city are anxious to share with San Francisco in the glories and profits of big "bonanzas."

MR. CHESNUT, who has the contract for repairing the suspension bridge at Grass Valley has sent below for material, and will commence work next week. It will be completed before wet weather sets in.

Rich Strike in the Carson Hill Melone's Mines.

We are informed that extremely rich rock has been struck in the Morgan mine, Calaveras county, on Carson hill, adjoining the property of the Melone's Consolidated Mining Co. This belt of mines was worked to great profit in early days, but became involved in costly and embarrassing litigation, in which it was held for many years. Now the whole property on the Carson hill has been covered by United States patent, and the title is clear.

From the Morgan mine, the one from which this rock is now being taken out, over a million and a half dollars were extracted. It has not been worked for many years, because of law suits. One piece of rock taken from this mine in 1852 or 1853, was exhibited at the London exhibition. It weighed 120 pounds, and yielded 82 pounds of pure gold. The new shaft is 50 feet below the tunnel which leads to the old works, and it is from this shaft that the rich rock is now being taken out. It is being worked in hand mortars and arastras, and we are informed is massive with gold.

The fact of this net-work having been struck in this old abandoned mine, augurs well for it and the adjoining property, which also bears the reputation of having yielded immensely. It has only been worked about six weeks, and the Melone's consolidated company have just started up their works also. They have two mills on the property, and now that they can work the rich telluride ores which the mines produce, will commence a vigorous campaign.

The Morgan mine used to belong to "Jim Fair," of bonanza fame. He contended for its possession for many years, and at last got it. Meantime, however, he had begun to coin money so fast in the silver mines of Nevada, that he neglected the California property. He instructed some friend or relations to pay certain amounts due on it, which he had failed to do. The mine was sold to the present owner by the sheriff, for $15, so it went out of Mr. Fair's hands in default of payment of that sum. He can stand it, however, if any man on this coast can. We are glad to hear of the good fortune of the present owner, and are assured that since this mine has commenced panning out so well, the old Carson Hill mine—known as "Melones" by French investers—will be vigorously worked as well as the Morgan itself.

The State Fair.

Our reports from the Fair up to the time of going to press are necessarily incomplete. The race as usual form the chief attraction to this sensational element represented there.

General Sherman and party arrived on the grounds Tuesday morning, and met with an enthusiastic reception. He expressed a lively interest in the races, and declared his intention to participate in the enjoyment of all the races of the week.

The stock parade on Tuesday morning was over a mile in length and unusually fine. The attendance on this occasion was very large.

In the sheep and goat department the display is fully equal to that of last year. Mr. R. A. Brunton has a good exhibit of French merinos. Mrs. Blacow, of Alameda county, also has on exhibition some representatives of her fine herd of French merinos. Mr. G. W. Leet has a pen of yearlings of the same kind of sheep.

Our old friends, Severance & Peet, of Niles, Alameda county, have as usual a fine selection from their valuable herd of thoroughbred Spanish merinos.

Fred. Cox has a Spanish merino buck, called 'Long Wool," which attracts considerable attention. J. B. Hoyt exhibits some good specimens of pure Shropshire and Shropshires crossed with Spanish merinos. S. B. Emerson and Wm. Fleming have on exhibition specimens of Cotswolds. Mr. Sullivan Treat exhibits a Silesian ram, "Longfellow," and a Spanish merino yearling, "Golden"; so named from the goldsu appearances of his fleece. Amos Adams, of Sacramento, has two fine pens of sheep.

Angora goats are represented at the Fair by members of the choice stock of Landrum & Rodgers, of Watsonville, and by some of the herd of the Gilmore Angora goat breeding association, of El Dorado county. C. P. Bailey, Dr. Thomas and J. G. Gell also have Angora goats on exhibition.

The swine department is not what it should be at this time, when there is evidently more call for increase and improvement in our swine than in any other department of farm stock. This is not to be understood as disparaging the quality of the exhibit, for the few breeders who have come out have brought animals that are fully up to the requirements of the time. Messrs. Sprague, Comestock and Entrican have each fine specimens of the Berkshire family. But there is manifestly a growing unwillingness on the part of breeders of all classes of stock to subject their favorite animals to the severe penance which such an exhibition implies. This will not surprise any one who properly considers the actual cash value of the animals, and the risks involved in the transit back and forth, and in ten days subjection to the depressing heat and bad water of Sacramento. And, aside from the actual risks involved, the considerate kindness and real affection, even, which the true breeder feels for his animals, makes him loth to expose them to such discomforts.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

A MACHINE FOR COUNTING STOCK.—William Jeans and D. H. Bailey, Fernalde, Humboldt county, Cal. This invention is an ingenious arrangement for automatically counting and registering stock, such as goats, hogs, sheep or cattle. This is accomplished by causing the animals to pass through a narrow passage or gateway, so constructed that but one can possibly pass through at one time, and in doing so a lever is moved which is connected with an indicator which registers the passage of an animal at each vibration of the lever. Numbers above one hundred are registered on an indicator attached to the first registar. It is often desirable to divide stock into different lots, in the interests of different proprietors. This is accomplished by the inventors of this machine by an ingenious arrangement of registers which can be set at any number required, and a bell connected with the lever and actuated by it is struck by a hammer and sounds the number in tens, twenties, or any subdivision desired. The animals are separated into different corrals as necessary by an ingenious arrangement of gates. The inventors claim that the swinging gateway is so arranged as to be entirely accurate in its movements and must be opened and closed by the passage of each animal, whether it walks, runs or jumps through.

IMPROVED PARLOR GAME.—Henry Darnell, San Francisco. This invention by our fellow-citizen, Mr. Henry Darneel, is known as "the chase," and is said to be the equal of chess in its capacity for intricate calculation, and yet so popularized as to be more fascinating to the general player. It is played upon a board similar in construction to a chess or checker board, except that three colors are used instead of two. In the center of the board is a square made of a different color from the other squares This is known as the "covert." Its purpose is to serve as a retreat for any piece which is being pursued by another, as, according to the rules of the game, no piece can be taken as long as it remains in the center square or "covert." A portion of the playing pieces are made to represent hunters, while the remainder are made to represent animals of the chase or game and the object of each player is to capture all of the game of the other party. In playing the pieces which represent the animals of the chase or game are placed in the row of squares on the outer edge of the board next to the players. Upon the next row of squares in front of the game, the pieces which represent the hunting force are placed. Each piece has its peculiar move similar to the mover of the pieces in playing chess, but the pieces which represent the game cannot capture the pieces which represent the hunters. When a piece enters the "covert" or center square, it cannot be taken so long as it remains there, but it can be forced to leave the "covert" by jumping it with one of the hunters. By making a "covert" or peculiar square in the center, the game of chase can be played upon an ordinary checker board, but the board provided by the inventor is larger, has more squares upon it, and is altogether preferable.

Peat as Fuel.

That cheap fuel will tend to promote the manufacturing and industrial interests of California, is a recognized fact by those best acquainted with the resources of the State. The California peat company have been engaged for some time in manufacturing peat for fuel at their works, at Roberts Landing, San Joaquin county, and are now turning out from 50 to 100 tons of fuel per day. They have seven samples on exhibition at the Mechanics' Institute Fair, and on Wednesday last a trial of its flame-producing properties was made in the furnace of the main driving engine in the Pavilion. A number of invited spectators were present, including representatives of the Press, and much interest was manifested in the result. The match was applied to the fuel at precisely twelve o'clock, noon, and in forty minutes steam was up. The trial was a thoroughly satisfactory one, and we are very much inclined to think, that peat as fuel, will ultimately prove a success in California.

CONCENTRATING.—Mr. Ruegger's article on Concentrating Works, a continuation of those in previous numbers, is unavoidably deferred this week, in order to prepare an engraving to accompany it. In the article on the "Concentrating Works at Falun," in our issue of September 18th, several per cent. statements were misprinted. The errors are two-thirds, one-half, four-fifths per cent. and four-sixth fold, and should read: two to three per cent., one to two per cent., four to five per cent., and four to six fold respectively.

Metallurgy of the Copper-Silver Ores of Inyo County—No. 4.

[Written for the PRESS by SAMUEL PURNELL.]

Leaching.

The roasted ore is sifted into wooden boxes or tubs provided with a false bottom, on which is stretched coarse canvas, the latter answering for a filter, Fig. 3. The boxes should be coated with pitch on the inside. A box 12 ft. long, 5 ft. wide and 2½ ft. deep will hold from five to ten tons of roasted ore, according to the kind of ore under treatment. Generally it should not be spread more than fifteen inches deep, but very porous ore may allow of leaching when twenty-four inches deep. The top of the ore should be spread evenly, always leaving at least six inches space from the top for the reception of the water. It was formerly customary to leach altogether with hot water; but at present cold is generally used, unless considerable chloride of lead is present, in which case, the lead being soluble in hot water may thus be gotten rid of and the silver extracted purer. Hot water, however, dissolves the base chlorides more easily than cold, and the filtering proceeds more rapidly. The water is next allowed to fill the tank, and when full a leaden cock below is opened and the water highly charged with metallic salts and showing a green color from the copper contained, is conducted by a rubber hose into another tank for subsequent treatment. The water is kept running in a continual stream for a couple of hours or more, till upon a test with an alkaline sulphide no precipitate of copper or other sulphides is thrown down. When all the soluble salts are removed the leaching with water is suspended and the ore is ready for the next operation.

Extraction of Silver.

A dilute solution of hyposulphite of lime is now led into the box to dissolve the chlorids of silver remaining. The manipulations are substantially the same as the leaching with water. The clear, cold and sweet liquor from the tank, containing a double salt of silver and lime, is conducted into precipitating tubs. Only two parts of the lime salt are required to dissolve one part of silver, while sixty-eight parts of common salt are required. The hyposulphite must not be concentrated and strong, else it will dissolve various base metal oxides remaining in the ore. This leaching may continue from eight to twenty-four hours according to the amount of silver present. The end of this lixiviation is ascertained in the same way as the preceding. Besides the silver chloride the hyposulphite will dissolve any chlorides of lead and antimony, or chloride or subchloride of copper remaining, and these metals may thus contaminate the silver. Subchloride of copper is not soluble in water. The silver chloride is first dissolved, and, therefore, the first part of the outgoing solution is the richest.

Precipitation of Silver.

The silver is precipitated from the double salt by adding to neutrality or saturated solution of sulphids of lime. It is poured in until all the silver is supposed to be precipitated, and the liquor is stirred vigorously to secure a quicker settlement of the black sulphids of silver. The exact neutrality of the liquid being ascertained and maintained, this operation is finished. These manipulations, though seemingly very delicate and complicated, can readily be performed by common workmen after a few days' instruction. The time required for precipitation is only about fifteen minutes.

At this stage of the process the oxygen of the air acts on the neutral solution and hyposulphite of lime is regenerated, which is immediately ready to be used on the next lot of ore. There is no waste of hyposulphite, but, on the contrary, a continual increase in strength and quantity; so much so that it frequently has to be diluted with water. After sufficient time has elapsed to allow all the small silver particles to settle, the slimy sulphids is drawn off into canvas filters, where it is washed with hot water to remove any solubls salts mixed in. The silver cake is next pressed and dried, and then calcined in a small reverberatory furnace, or a muffle. In this most of the sulphur is burned off at a dark red heat in one or two hours, and the cakes are reduced to a mixture of sulphids and metallic silver. The refining is usually done by smelting in plumbago crucibles with metallic iron and borax. According to the quality of the ore, and the character of the manipulations, the silver will be from 900 to 950 fine. The extraction of silver is very close; with good work the tailings will not assay more than three or four dollars a ton. There is no difficulty in chloridizing to 90 or 93 per cent. One pound of good quick lime and one and a third pounds of sulphur give a solution of sulphids of lime that will precipitate about half a pound of silver.

[The conclusion of this chapter on "Leaching" will appear next week, with engravings showing the details of the operation. The crowded state of our columns prevents us giving the whole chapter in one number of the PRESS.—EDS. PRESS.]

MORE dwelling houses are wanted in Petaluma.

A New Method of Determining Positions of the Sounding Boat.

Application of the Two-Point Problem to Hydrographic Surveying.

At the last meeting of the California Academy of Sciences, the following paper was read by T. J. Lowry, of the U. S. Coast Survey:

This is called the age of practice, the inventive age. And undoubtedly the prevailing tendency of the science of this age is synthetic. The problem it places before itself is not so much to discover isolated truths, as to combine, to harmonize, to generalize, to utilize those already found out. Instead then of indulging in ineffectual wanderings in the labyrinths of analytics, let us pause for a moment in the field of synthetical geometry—where Euclid, Newton and Bessell deigned to labor—and see if there are not "seed fallen by the wayside, among rocks and in stony places," which we may cause to yield profitably for the exact arts.

The increased traffic and travel on the rivers, bays, lakes, gulfs and oceans within the last half century, have made the accurate mappings of the topography of these water-basins of the earth, commercial, national necessities. The civilized nations of Europe have long felt and acted upon these demands of navigation and commerce, nor has the United States been left in arrears, for already has she executed a system of hydrography—even extending her researches into the Gulf stream and kindred interocean rivers, securing results which challenge at once the wonder and admiration of the scientific and navigating world.

The hydrographic chart is the lamp to the navigator's path over the intricate windings of the waters of the earth, the revealer of rocks, shoals, reefs hidden beneath smiling seas, and therefore the secret to a safe navigation and, hence, successful international commerce; does it not then gentlemen behoove us, as a scientific body, to make all possible improvements in the theory and practice of hydrography?

Hydrographic surveying was reduced to a real, a practical entity by the discovery of the three-point problem, by Pothenot. This problem being wide in its application, accurate in its determinations, and yet most simple in its graphic solutions, has, from the first, stood the grand central truth of practical hydrography. But to fix a position by this problem is required, on three known points, two connected angles observed simultaneously. And with only two known signals in sight it utterly fails to fix a position. Now it is to remedy these defects, to fill up these gaps left open by the three-point problem, and thus enable the hydrographer to determine his position under a wider range of contingencies, that I propose the application of the two-point problem to hydrographic surveying.

In determining positions of the sounding boat, equal in accuracy, and second only in point of usefulness to the three-point problem, is the two-point problem, which, with its many varied phases and fewer known points, greatly increases the hydrographer's capability of ascertaining his position under every contingency. The problem determines any two points on an unknown range (or inter-range) if at each of these points are measured the (two) angles contained by this range and two known signals. The boat's path may either coincide with the range or inter-range (see Fig. 1), or cross it at two or more points (as shown in Fig. 2). In the first case we can fix the position of the boat at any two or more instants by "angling" at those instants on two known signals ("*A*" and "*B*"), and the undetermined range. When the boat only crosses the range at two or more points, its position can be fixed by this problem only at these points, and that, of course, by "angling" at the very instants of crossing the range. The better conditioned the quadrilateral, formed by the two known points and the two places of observation, the better will these places be determined; and will be wholly undetermined when the right line, through the places of observation, prolonged traverses either one or both of the observed signals.

Where ranges are ready prepared for us—as when adjacent to cities with their flag-staffs, chimneys and spires, or where the country rises into highlands and mountain peaks back from the shore—the determination of a boat's position by this problem is alike easy and expeditious. And even where nature does not offer such ready prepared facilities, we can readily supply them, where the water is comparatively shallow, by dropping temporary spar buoys (a pole with rock to one end,) One buoy will furnish a stern range, if we have another visible stationary object directly astern, or an inter-range if directly ahead. But if there is no such stationary object visible, then continue the line of soundings, and drop further along a second buoy, and at the same instant measure the angles contained by two known signals, and the first buoy, and from another point on the range of these buoys, catch the angles between this range and any two known signals, and the soundings are determined. By cutting on a third point on shore, from two or more of these determined positions of the boat, it can be fixed in position without visiting the shore or even stopping the sounding boat; other signals may thus readily be substituted for those swept away by storms, etc.

The buoys thus dropped being determined fixed points, may serve as signals for carrying a hydrographic triangulation further on out off shore. This problem will thus prove most useful in the survey of off-shore shoals and reefs, and in the location of buoys, where only two signals are in sight. And it may, moreover, be found especially serviceable in the surveys of those large shallow bodies of water which abound along the Atlantic and gulf coasts of the Southern States, where the low shores and hazy atmosphere render it extremely difficult to keep three signals in sight.

The geometrical construction of this problem is accomplished in the following obvious manner: On *A B*, in Fig. 3, describe segments containing respectively the angles, *A M B* and *A P B*, draw the chord, *B y*, to cut off segment, *B A M y*, containing the angle, *B M y*, and another chord, *A x*, cutting off segment, *A B P x*, containing the angle, *A P x*. The points, *x* and *y*, will be in the same right line with *M* and *P*; join *x y*, which produce both ways till it cuts the circumferences in *M* and *P*, which will be the required places of observation.

The trigonometrical analysis furnishing the readiest means for computing this problem, is that known as the indirect. Thus let any number as 10 or 100 represent, *m p*, in Fig. No. 1. Then in the triangle, *A m p*, are known the angles, *A m p*, (= *A M P*), and *A p m* (= *A P M*), with side, *m p*, from whence, *A m*, may be found. In the triangle, *m p b*, are known angles, *m p b* (= *M P B*), and *b m p* (= *B M P*), with *m p*, to find *b m*. Now in the triangle, *A m b*, are known angle, *A m b* (= *A M B*), and the sides, *A m* and *b m*, from which *A b* may be found. And now from the similarity of figures *A b* : *A B* :: *m p* : *M P*, and by like

Fig. I.

Fig. II.

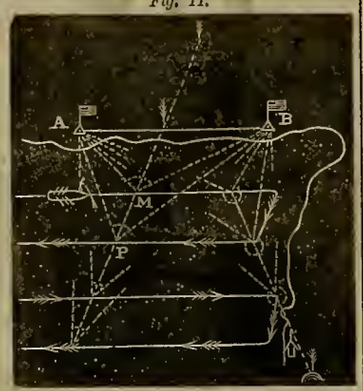


Fig. III.

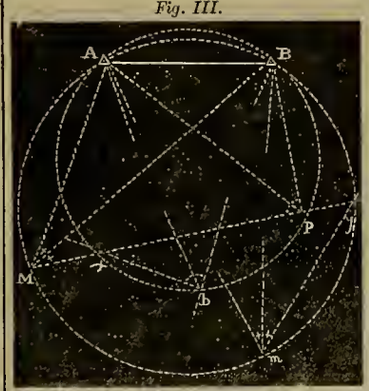

Fig. IV.

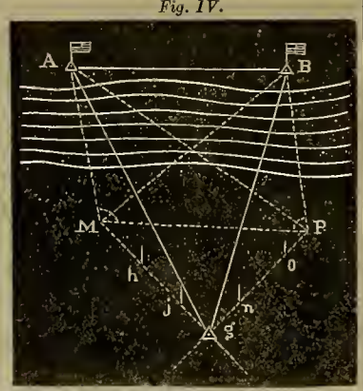

THE TWO-POINT PROBLEM IN HYDROGRAPHY.

proportions any other of the required sides may be found.

The two-point problem finds a ready graphic solution by laying off each set of observed angles on a separate piece of tracing paper, and shifting these two papers until the lines of sight traverse each its proper point, then prick the vertices of these angles onto the sheet, and they are (*M* and *P*), the required points of observation.

But a better graphic solution, based upon very obvious geometrical considerations, is found in the three-arm protractor;—with the angles measured at *M* (see Fig. 3) set off on the proper limbs of the protractor, cause its left and middle arms to traverse *A* and *B*, and draw a line along its right arm. Shift center of protractor to some point as *m*—taking care to keep *A* and *B* bisected by left and middle arms—and draw another line along right arm and *y*, the point of intersection of these lines, will be a point in the right line through the places of observation, *M* and *P*. Now set off the angles observed at *P* on the corresponding limbs of protractor bisect *A* and *B* with the fiducial edges of the middle and right arms. Draw line along left arm—shift center of protractor to some point as *p*, and with middle and right arms still bisecting *A* and *B*, draw line along left arm, and *x*, the point of intersection of these two lines, will be a second point in right line through *M* and *P*. Draw an indefinite right line through *x* and *y*. Now with the angles observed at *P* on the protractor, cause its middle and right arms to traverse *A* and *B* while the true edge of its left arm coincides with line through *x* and *y*, dot its center and we have *P* one of the places of observation; and, in like manner, find *M* the other place of observation.

These are the solutions of the case of this problem where only two known signals are involved. There are, however, two other cases: First, where from one position of the boat signals *A* and *B* are visible but from the other only *B* and *C* are seen; here the boat's positions are equally well determinate, and the geometrical construction and graphic solutions are the same as above given—but the trigonometrical analysis varies slightly (see Narrien's Geodesy). And in the second case, where first position of boat sees only signals *A* and *B* and its second position only *C* and *D*, these positions are still determinate, and the graphic solutions and geometrical construction are identical with those already given, but the trigonometrical analysis is different as shown by the writer on page 19, vol. 2, of "The Analyst."

The two-point problem may, moreover, be found most serviceable in restoring lost stations. Suppose the case illustrated in Fig. No. 4—where (the surface mark of) station *G* is lost and its restoration is desired. Having an approximate idea of the position of the lost station, *G*, choose two such points, *M* and *P*, as make at once the quadrilateral, *A B P M*, and the triangle, *A M G*, *B P G* and *G M P*, "well conditioned." Then at *M* and *P* successively measure the angles, *B M A*, *B M P*, *A P B* and *A P M*, and find—either by construction or computation as above shown—the unknown sides and angles of the quadrilateral, *A B P M*. Now from the original triangulation are known the sides *G A* and *G B*, and angles *G A B*, and *G B A*; and the angle, *G B P* = *P B A* − *G B A*. We hence have two sides, *G B* and *P B*, and included angle, *G B P*, to find *P G* and angle, *B P G*, the distance and direction of the lost station, *G*, from the point, *P*. But if no linear measure is available, then mark the direction of *G* from the point, *P*, by range poles, *n o*, and shift the theodolite to *M*. Find angle, *A M G*, in like manner to that which found angle, *B P G*. Then cover *A* with telescope, turn it in azimuth equal to angle, *A M G*, and mark the direction of its line of sight with poles, *i h*. We then have marked out two ranges, *i h* and *o n*, intersecting at "the lost station," *G*.

And equally applicable when on land searching for a lost station with three signals in sight, is the manœuvre so well understood in hydrography of taking from the sheet the angles subtended by the three signals at the lost station, setting them off on two one-angle, or one two-angle sextant, and shifting the position of the observer till the images of these signals coincide in his horizon glass, when he will be close on the "lost station."

AMERICANS AHEAD IN JAPAN.—The *Ironmonger* (English,) for August, says: "In Japan the Americans have been too sharp for us. Before the English cutlery found its way there, the American factor was in the field. The Japanese are a shrewd race, and if they do not find the American cutlery equal to their expectations, or in some measure proportionate to the representations of their merchants, they will soon turn to the English cutlery. But for the present the Japanese markets are scarcely considered in the calculations of Sheffield manufacturers."

THE new gas works in Santa Barbara are nearly completed.

Vulcanized Rubber Fabrics.

Few people have any adequate conception of the variety of uses to which rubber is put, or the number of different articles which are made from it. Ever since the famous vulcanizing improvement was made the difficulties which previously prevented its wide introduction no longer interfered, and now we see rubber adapted to thousands of purposes which were before entirely out of its sphere. It has been made available to the comforts of life in the shape of woven textures, substitutes for leather, etc., many of which it supersedes, in a great measure, in point of durability and resistance to atmospheric influences, in decorative art, and for many scientific uses, it offers great facilities, which, at the present day, could not well be dispensed with. To the chemist it is of paramount importance, enabling him to arrange at little expense complete apparatus of all kinds. In surgery it has a place reserved for its exclusive use, especially in the construction of instruments requiring suppleness and flexibility. It is now adapted to mechanical purposes of all kinds to a very great extent. In fact, the enumeration of all its applications would be a work of time, and would contain a list sufficient to fill this paper.

It is only recently that a factory for the manufacture of rubber goods has been started on this coast, and there is only one this side of Chicago. This was established in San Francisco about a year and a half since by Weaver, Taylor & Co., 501 Market street, who carry on the most extensive trade in this class of articles on the coast. It started as a very small concern, has been increased in capacity, and the proprietors are about increasing it again. At this factory rubber goods of all kinds are made to order. They are prepared to make mold work of every description, including car and wagon springs, valves of all sizes and descriptions, cylinders and gaskets of every shape and size, rings for fruit jars and all other articles made of rubber which the trade may demand. They make a specialty of covering rollers for wringing machines. The old rollers are recovered with rubber, making them as good as new, thus saving the expense of purchasing a new machine. Inventors desiring articles made of rubber can be accommodated and advised by the above mentioned firm.

Articles manufactured by Weaver, Taylor & Co., at the factory in this city, may be seen at the Mechanics' Fair, among the rubber goods exhibited by them. Among other things they exhibit steam, conducting, oil, petroleum, steam fire engine and suction hose, car and wagon springs, valves for pumps and steam engines, corrugated rubber for steps and for flooring, pure sheet rubber for packing, rubber clothing, saddle bags, fishing stockings, caps gloves, mittens, and a variety of small articles too numerous to mention.

Messrs. Weaver, Taylor & Co. are agents for the Gutta Percha and Rubber manufacturing company, New York, carholized hose, belting, packing, etc.; Goodyear's india rubber glove company, rubber clothing and fancy goods; Hazard powder company, sporting and blasting powder, and Amoskeag manufacturing company, steam fire engines; Trump Bros., Wilmington, Del., Fleetwood machine saws. They keep a large stock of every possible variety of rubber goods on hand, and make for the trade here all special articles, such as are not kept in an ordinary stock of rubber goods. The list of rubber fabrics adapted to mechanical purposes is very large; rubber hose, carholized hose, steam and oil hose, suction hose valves, packing, tubing, fire buckets, rubber belting of all sizes, clothing, ladies' and men's gloves and mittens, hose covers, carriage aprons, combs, toys, mechanics' aprons, fishermens' pants leggings, jackets and boots, bath tubs with frames, gun and hat covers, door springs, piano covers, air pillows and beds, whip sockets, rings, submarine armor, etc. A very great variety of small articles are kept, too numerous to mention. Of course, at the Fair only a very few of the articles dealt in are exhibited, and those mainly such as are used for mechanical purposes.

A GREAT COAL CARRIER.—It is said that the Ohio river is the greatest coal carrier in the world, notwithstanding the fact that it is frozen up during most of the winter, and nearly dried up a large portion of the summer. A "run" of coal is said to have been made during the month of July last, when 375,928 tons were shipped in forty-eight hours! This amount would have loaded over 37,000 eight-wheeled cars which would have had to have been made up into about 1,000 heavy freight trains. It is nearly equal in tonnage to the entire shipment of wheat from this State during a full year. The cause of such a big "run" is the uncertain stage of water in the Ohio. When there comes a season of low water the coal is collected in barges at Pittsburg and held until a good stage of water comes, when it is all run out at once as above. The greatest "run" recorded took place in April, 1872, when 582,300 tons were shipped in about the same length of time.

THE Wilmington manufacturing company, at Wilmington, now have their shop in full running order.

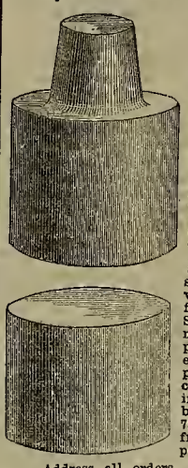
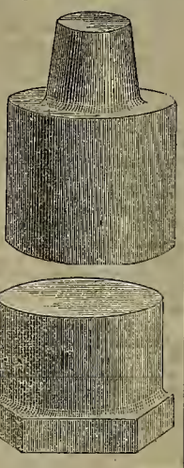
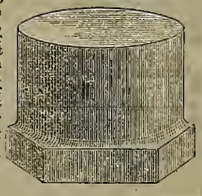
Improved Cast and Forged Steel Shoes and Dies for Quartz Mills.







[PATENTED MAY 26TH, 1874.]
Price Reduced to 16 Cents Per Pound.
SAN FRANCISCO, November 10th, 1874.

To Supts. of Quartz Mills and Mining Men generally:

We take pleasure in stating that owing to the rapid increase in our orders, our Pittsburg Manufacturers have been compelled to add largely to their works—a new gas furnace and heavier trip hammer—and are thus enabled to reduce the cost of steel and at the same time produce SHOES AND DIES superior to any yet manufactured. We have consequently reduced the price to 16 cents per pound and solicit a trial order, guaranteeing that you will find them at least 10 per cent. cheaper than the best iron. There are no STEEL SHOES AND DIES made excepting under our patent and sold at this office, or by our authorized agents, though certain Eastern manufacturers advertise STEEL SHOES AND DIES which are only cast iron hardened by the addition of a composition. They will not out-wear two sets of common iron, though called steel. They are very brittle and are not capable of being tempered, flying from under the hammer like cast iron. Our STEEL SHOES AND DIES are in use in many of the largest mills on the Pacific Coast, and all who have tried them pronounce them cheaper and far superior to iron in every respect, even at the old price of 20 cents per pound. Their advantages over iron are cheapness on first cost, increased crushing capacity, time saved in changing and in setting tappets, increased value of amalgam by absence of iron dust and chippings, and a saving of 75 per cent. in freight. It takes 50 days to fill orders from the manufactory East. Price 16 cents per pound shipped at San Francisco. Terms liberal.

Address all orders, with dimensions, to W. R. Townsend, Secretary.

ROOT'S "SAFETY" BOILER

MANUFACTURED BY THE

Abendroth & Root M'f'g Co.,

BROOKLYN, N. Y.

THE ROOT WROUGHT-IRON SECTIONAL SAFETY BOILER has been improved and perfected by Eight years experience, and the sale of

Over 1,500 Boilers,

for all purposes. Is perfectly safe from Destructive Explosion, all parts easily accessible for cleaning. **Utmost Durability, Highest Economy in Fuel, Reasonable Price.** Working portion composed of **Wrought-iron Boiler Tubes, tested to a pressure of 500 pounds per square inch.** Steam from cold water in from *ten* to *twenty* minutes.

We refer to the following parties, among others, who are using the Root Safety Boilers:

H. F. Williams.....San Francisco, Cal.
Humphrey & Mock.....Millerton, Cal.
Parke & Bowie.....Virginia City, Nevada.
Chollar-Potosi Mining Co.....Virginia City, Nevada.
Union Mill & Mining Co.....Gold Hill, Nevada.
Belcher Silver Mining Co.....Gold Hill, Nevada.
Imperial Mining Co. (170 h-p)....Gold Hill, Nevada.
J. B. Montgomery.....Portland, Oregon.

Send for Circular and Price List.

J. CURLE, Gen'l. Agent for Pacific Coast,
No. 513 Montgomery St., San Francisco.

STEEL SHOES AND DIES
FOR QUARTZ MILLS,

Made by our improved process. After many years of patient research and experiment we have succeeded in producing STEEL SHOES AND DIES for QUARTZ MILLS, which are unequalled for *Strength, Durability and Economy.*

Die. Shoe.

Will wear three times longer than any iron Shoes.

BUILDERS AND CONTRACTORS

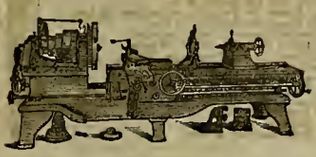
Of Quartz Mills, Pans, Separators, Concentrators, Jigs, Hydraulic Rock Breakers, Furnaces, Engines, Boilers and Shafting, and General Mining Machinery in all its details, and Furnishers of Mining Supplies.

All orders promptly filled.

MOREY & SPERRY,
88 Liberty street, N. Y.

Examination solicited.

EDWIN HARRINGTON & SON,



Manufacturers of ENGINE LATHES, 48 inches swing and smaller; VERTICAL BORING MACHINES, suitable for jobbing and boring Car Wheels; UPRIGHT DRILLS, 36 inches and smaller, and other Machinists' Tools.

COR. NORTH FIFTEENTH ST.
AND PENNSYLVANIA AVENUE,
Philadelphia, Pennsylvania.

LANE & BODLEY,

John and Water Sts., Cincinnati.

Manufacturers of

PORTABLE & STATIONARY STEAM ENGINES,

From two to two hundred Horse Power. Send for illustrated catalogue.

THE KNOX & OSBORN

QUICKSILVER FURNACE.

THIS FURNACE REDUCES CINNABAR, (ROCK OR FINE EARTH,) AND

WORKS CLOSER TO AN ASSAY

And at **LESS COST** per ton than any other furnace. It will work continuously Twelve to Twenty-four months without stopping.

NO MAN HAS EVER BEEN SALIVATED

Or otherwise affected by the mercury about the furnace, either in operating it or making repairs. For full particulars, plans, etc., apply at

NOS. 19 AND 21 FIRST STREET, SAN FRANCISCO.

We refer any party desiring a good furnace to either of the following Mining Companies where the furnace may be seen in successful operation:

The Manhattan Mine in Napa County.
The Redington Quicksilver Mining Company, Napa County.
The California Quicksilver Mining Company, Napa County.
The Phœnix Quicksilver Mining Company, Napa County.
The Etna Quicksilver Mining Company, Napa County.
The Ida Clayton Quicksilver Mining Company, Sonoma County.
The Annie Belcher Quicksilver Mining Company, Sonoma County.
The Geyser Quicksilver Mining Company, Sonoma County.
The Cloverdale Quicksilver Mining Company, Sonoma County.
The California Borax Company (Sulphur Banks), Lake County.
The Abbott Mine, Lake County.
The Buckeye Mine, Colusa County.
The Cerro Bonito Mine, Fresno County.

cow KNOX & OSBORN.

THORNE, DeHAVEN & CO.

21st Street, above Market,
PHILADELPHIA.

DRILLING MACHINES.

PORTABLE DRILLS. Driven by power in any direction, self-feed and convenient adjustment.
RADIAL DRILLS. Self-feed—large adjustable box table—separate base plate, every convenience.
VERTICAL DRILLS. Self-feeding—of new and improved designs.
MULTIPLE DRILLS. For boiler work, etc., 2 to 20 spindles, fed and returned by power or hand, together or separately.
HORIZONTAL BORING AND DRILLING MACHINES. For large pieces—with boring head, adjustable, vertically and horizontally.
SPECIAL DRILLS. For special work. Gun Blank Drills, Coal Drills, &c., built to order.

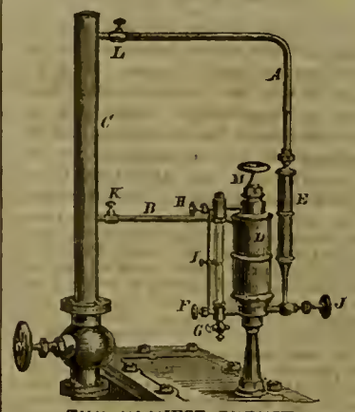
NYLAN & YOUNG,

mar27sow 18 & 20 Spear Street, S. F.

N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23

The Ingersoll Rock Drill.

This Drill is used extensively in the Eastern States and all Foreign Countries.

IT CAN BE RUN WITH

LESS POWER, LABOR AND REPAIRS,

—AND—

DO MORE WORK

THAN ANY OTHER DRILL IN THE MARKET. THE

Automatic Feed

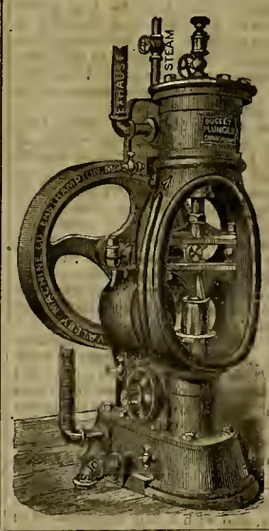
Is an important feature, as it saves labor. We ask for a trial against any competitor. For information regarding the same, send for circular to

JUDSON & SHEPARD, Agents,

Cor. Clay and Front streets, San Francisco.

PARKE & LACY,

310 California street, San Francisco



Sole Agents for WRIGHT'S

BUCKET-PLUNGER STEAM PUMP.

Pioneer Screen Works,

Removed to 32 Fremont Street, near Market.

SCREENS

J. W QUICK.

Manufacturer of perforated sheet metals of every description, at reduced rates. Mill owners mining Battery Screens extensively, can contract for large supplies at favorable rates. This is the only establishment on the Coast devoted exclusively to the manufacture of screens

San Francisco Cordage Company.

Established 1856.

We have just added a large amount of new machinery to the latest and most improved kind, and are again prepared to fill orders for Rope of any special lengths and sizes. Constantly on hand a large stock of Manila Rope, all sizes; Tarred Manila Rope; Hay Rope; Whale Line, etc., etc.

TUBBS & CO.,

e20 611 and 613 Front street, San Francisco

An Immigrant Depot.

At the present writing, over fifty thonsand immigrants have located permanently in California since the firet of January. We find in connection with this important matter, many causss for congratnlation. Asids from the gain to the State by this immigration, and the advantagss derived by the immigrants, have we not reason to bs, at leaet, eatiefied with the incidentals connected with it? Notwithstanding ths nnceasing vigilance of the Press of our own State, always ready to expose imposition upon etrangers, and though the Eestern Press have been on the alert to make capital of any and everything that could possibly he nsed ae a wet blanket on emigration, how little has been brought to light concsrning California's improper treatment of her new citizene! Philanthropy, and even common hospitality, have been placed in euch low repnts by those who have stolen their livsry to serve thsir own purposes in. thet we will not claim for California eny credit on those scores; hut, without appeeling to the immigrant of 1875 as "a man and a brother," we wonld ask him, or thoee who presume to speak for him, if, ns a fellow citizen, he has not received setisfactory treatment here?

And, we wonld ask our own people, is there any occasion for a radical change in our method of rscsiving and d:eposing of ths probably increassd immigration of the coming year? Or, to bring the matter down to a still simpler form, had we not bstter continue our let-alone policy, and abstain from all interference with the affairs of our new neighbors?

Among the castles in the air that the philenthrophy of the day is devising, is an immigraut depot, with snch connections and surroundings as would effectuelly protect the newly arrived immigrant from the land sharks that await his arrival; something that will be to San Francisco what Castle Garden is to New York. Now we wonld like to impreee upon the minds of our officious friends the fact, that California immigration ie not made np of "shoale and nations" of ignorent maeses from the hogs or ovsr crowded fields of Enrope, at the mercy of enthusiasts or tricksters; to be plented in colonies and to be provided for or fleeced by a few irresponsible individnals; they are mostly shrewd, practical, ventnreeome Yankees. They are bent on trying their fortune here; if they don't like it they will go somewhsre else; though thers is more probability thet *they* will be the permenent occupants of the conntry and that those whose bowels are now yearning over their fancied wrongs will retire before them.

Peopls who do not fathom ths true Americen character—and it is really a matter of wonder how few thsre are who do comprehend it—will persist in the belief that these immigrants are coming here like flocks of sheep; ready to be driven or lead hither and thither as individuals or orgenizetions may desire.

There are indications thet ths next Legislature will be called npon to devise some meane by which the State can provide for fnture immigration, "as a hen gathereth her chickens under her wings;" but it is to be hoped that our legislators will not allow even the milk of human kindness to dilute and submerge plain common eense and simple jnstice in this matter. In our opinion, such action is not only uncelled for by surrounding circumstancss; it would prove a sonrce of general evil.

It is apparent to the observing public thet much that has been urged for the welfare of the immigrant, hae been with a visw to bsnefit speculators and there hirelings, and not to provide for the new comsr. We believe we speak for a largs portion of the community when we declare that we would rather our friends on their arrival in San Francisco fall into the hands of hackmen and hotel runners, who make no pretensions to philantropy than of those who are hired by specnlative land owners, to give the supposed simple immigrant "a bit of friendly advice."

This matter has been treated too leniently thue far. We would put our friends on their guard ageinet this new confidence game; and would teke thie occasion to assure them that they can with more safety truet to the honor and generous sympathy of California at large, than to any self-praising commnnity that claims to have more intelligence or more purity than its neighbors.

AT THE PAVILION.—Notwithstanding the State and other fairs, and with a full complement of other attractione to compete with, the Industrial exhibition at the Pevilion, still holde its own. Thousands congregate there every day and evening to view the wondere in art and mechanism, to promenade the gay and buay scenes of the mammoth building, to loiter through that charming retreet the conservatory, or to sit in some of the many pleasent places provided for such casee, and read the MECHANICS' FAIR DAILY. The cash box in tho office ie a pretty reliable thermometer by which the public interest may be teeted. This still marke up to a eetiefactory point among the thousande. On Saturday night of laet week the receipte were in excess of any occasion since tne opening of the fair. The time for closing the fair is not definitely settled yet. It will certainly continue two weeke longer.

THE citizene of Santa Ana and vicinity lately held a meeting to consider the feasibility of building a narrow gange road to Newport, a distance of eight miles. The road and necessary rolling stock will cost about $75,000.

The Mining Share Market.

The resnlt of the resnmption of businss by the stock boards and the opening of the new Nevada bank, whish will occnr on the 4th proximo, is lookad forward to with a strong degree of interest by every one at all intereeted in mining shares. Thoss who are moet familiar with etock transactions, state that the affairs of the brokers are in a very fair condition. The San Francisco Stock Board has publishsd the basis upon which its members will be compslled to adjust all contracts left nnadjosted at the time the Board ceased its seesione. Most of them have already been satisfactorily adjusted. The California Board has been in operation and done a flouriehing buciness throngh the past week. Wednesday the morning sales aggregated 5,000 sharse. The following wsre the prices of some of the leading stocks on Wednesday: Andes, $3 50; Beet & Belcher, $36; Belcher, $17.75; Crown Point, $22; California, $53; Ophir, $45; Union Conealidated, $8.12½; Yellow Jacket, $57.

The following assessments have been levied since our last: El Dorado, Glasgow, Carrie Hale, Juniata Con., Amezon Con., Wells-Fargo, Sunrise, Dayton, Iowa.

The Black Bear quartz mining company have declared their regular dividend of 25 cents per share, payable after September 13th.

Reports continne favorable from the mining districte, as will be seen by consulting our Mining Summary.

PATENTS & INVENTIONS.

By Special Diepatch, Dated Washington, D. C., Sept. 21st, 1875.

FOR WEEK ENDING SEPTEMBER 7TH, 1875.*

ELEVATED RAILWAY.—Wm. H. Harrison, Livermore, Cal.

SIDE HILL PLOW.—Robt. J. Knapp, Half Moon Bay, Cal.

PROCESS OF TREATING RATTAN.—Carlton Newman, S. F., Cel.

FORCE PUMP.—Frederick W. Clarke, S. F., Cal.

SPRING POWER REGULATOR.—Orrin Collier, Sacramento, Cal.

HARROW.—Jas. B. Green, Elliott, Cal.

BURIAL CASE.—David W. Hunt, S. F., Cal.

AMALGAMATOR.—Chas. H. Aaron, S. F., Cal.

JOINT FOR HYDRAULIC NOZZLES.—Jno. J. Crawford. S. F., Cal.

GATE.—Chas. C. Redmond and Henry H. Rhodee, San Joee, Cal.

A WRONG CUSTOM CORRECTED.

It is qnite generally the custom to take etrong liver stimulants for the cure of liver complaint, and both the minsral and vegetable kingdoms have been diligsntly searched to procure the most drastic and poisonons purgatives, in order to produce a powerful effect upon the liver, and arouse the lagging and enfeebled organ. This system of treatmsnt is on the same principle as that of giving a weak and debilitated man large portions of brandy to enable him to do a certain amount of work. When the stimulant is withheld, the organ, like the syetem, gradually relapses into a more torpid or sluggieh and wsakened condition than before. What then is wanted? Medicines, which, while they cause the bile to flow freely from the liver, as that organ is toned into action, will not overwork and thns debilitate it, hnt will, when their use is discontinued, leave the liver strengthened and healthy. Such remedies are found in Dr. Pierce's Golden Medical Discovery and Purgative Pellets.

A CURE OF LIVER DISEASE.

RUSK, Texas, May 10th, 1873.

Dr. R. V. PIEBOE, Buffalo, N. Y.:

Dear Sir—My wife last year at this time was confined to her bed with Chronic Liver Diseaee. I had one of the best doctors to see her, and he gave her np to die, when I came npon some of your medicine. I bonght one bottle of it and commenced giving it. She then weighed eighty-two ponnds; now she weighs one hundred and forty ponnds, and is robust and hearty. She has taken eight bottles in all, so you eee I am an advocate for yonr medicine.

WILLIAM MBAZEL.

FROM THE NOTED SCOUT, "BUFFALO BILL."

HOLLAND HOUSE, Rockford Ill., April 20, '74.—Dr. R. V. PIERCE, Buffalo, N. Y.: *Sir*—I have now taken four bottles of your Golden Medical Discovery in connection with your Pellets, and must esy that nothing I have ever teken for my liver hae done me as much good. I feel like a new man. Thsnke to your wonderful medicine.

W. F. CODY. ("Buffalo Bill.")—Com.

THOUGHTLESSNESS.—Persons sometimes return thei paper, marked "stop this paper." Their name being pasted on the sheet they thiuk that is all we need to he able to cross their names off. Now that is thoughtlessness. Your P. O. address is needed as much as your name. We have thousands of names srranged only according to locality. Our mailing clerk does not know where everybody lives.

WOODWARD'S GARDENS embraces an Aquarum, Museum, Art Gallery, Conservatories, Tropical Houses, Menagerie, Seal Ponds and Skating Rink.

MINING SHAREHOLDERS' DIRECTORY.

Compiled every Thursday from Advertieemente in the Mining and Scientific Press and other S. F. Journals.]

The Mining and Scientific Press.

[ESTABLISHED IN SAN FRANCISCO, 1860.]

Is the leading mining journal in America, and enjoys a large circulation among the more intelligent operators and workers in the gold fields of the world.

As a scientific and mechanical representative of the Pacific Coast, it is decidedly popular and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivalled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer will find profit by its reading.

Subscription, $4 a year, in advance. Sample copies post paid, 10 cents. As an

ADVERTISING

Medium for the Pacific Coast, it is superior to any other journal for all kinds of mining and hydraulic machinery and other mechanical work, building materials new manufactures and inventions. Our rates are very reasonable compared with those of other first-class journals. DEWEY & CO., Publishers.

224 Sansome street, San Francisco.

Designing and Engraving at This Office.

We are prepared to do fine Wood Engraving for illustrating Landscape Scenery, Buildings, Machinery, Works of Art, Manufactured Articles, Trade Marks, Seals, Etc. We have a first-class

Machine for Engraving

A portion of the work, which can be finished thereby more perfectly than by the eye and hand alone. Our patrons can depend upon first-class work always, and at reasonable prices. Samples can be seen at our office.

DEWEY & CO.

To Country Printers.

The large drum cylinder printing press, now used in the FAIR DAILY office, in the Mechanics' Pavilion, is offered for sale. It is nearly new, works satisfactorily, and will be sold at a bargain. Address PAINTER & Co., type founders, 513 Clay street, S. F., or the publishers of this paper.

PACIFIC RURAL PRESS,

A first-class 16-page Agricultural Home Journal, filled with fresh, valuable and interesting reading. Every farmer and ruralist should take it. It is immensely popular. Subscription, $4 a year.

DEWEY & CO., Publishers,
No. 224 Sansome street, SAN FRANCISCO.

$5 to $20 Per Day at home. Terms free. Address G. STINSON & Co., Portland, M.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and Retail, by DEWEY CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quick silver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an anthor whose reputation is unsurpassed in his speciality.

Price $2.50 coin, or $3 currency, postage free

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the anbjects treated. Its anthority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Mill man, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO $5.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially or the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of the general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

Price, $5 in cloth; $6 in leather—coin.

BY OTHER AUTHORS.

The Quartz Operator's Hand-Book; by P. M. Randall. 1871. Revised and Enlarged Edition. Cloth bound, 175 pages. Price, $2.

Sulphurets: What They Are, How Concentrated, How Assayed, and How Worked; with a Chapter on the Blow-Pipe Assay of Minerals. By Wm. M. Barstow, M.D.; 1867; cloth bound, 114 pages. Printed and sold hy DEWEY & Co. Price, $1; postage free. The best written work, and most complete work on the subject treated.

ANY OTHER BOOKS DESIRED will be furnished at the most reasonable rates by DEWEY & Co., Mining and Scientific Press Office, S. F.

Mining and Other Companies.

Gover Mining and Milling Company—Principal place of business, San Francisco, Cal. Location of works, Oleytown, Amador county, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 3d day of September, 1875, an assessment of ten cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company, No. 402 Front street, room 8, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 11th day of October, 1875, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Saturday, the 30th day of October, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

W. O. WILSON, Secretary.

Office, No. 402 Front street, room 8, San Francisco, Cal.

Hope Quicksilver Mining Company—Location of principal place of business, San Francisco, California. Location of works, Cinnabar Mining District, Sonoma County, State of California.

Notice is hereby given, that at a regular meeting of the Board of Directors, held on the 2d day of August, 1875, an assessment (No. 2) of Five cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, Room 2, No. 408 California street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 9th day of September, 1875, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Thursday, the 30th day of September, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

JACOB HARDY, Secretary.

Office, Room 2, No. [illegible] California street, San Francisco California.

POSTPONEMENT.—The date of the delinquency of the above assessment is postponed to the 8th day of October, and the date of delinquent sales to November 1st, 1875.

By order of the Trustees. J. HARDY, Secretary.

September 8, 1875.

Manhattan Marble Company of California. Location of principal place of business, San Francisco, California. Location of works, Oakland, Alameda county, State of California.

Notice is hereby given, that at a meeting of the Directors, held on the 6th day of August, 1875, an assessment (No. 8) of five dollars per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary of the company, at his office, Nos. 13 and 15 Fremont street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of September, 1875, shall be deemed delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 4th day of October, 1875, at 12 o'clock M., to pay the delinquent assessment, together with costs of advertising and expenses of sale.

L. L. ALEXANDER, Secretary.

Office, Nos. 13 and 15 Fremont street, San Francisco, California.

Mount Auburn Gold Quartz Mining Company. Location of principal place of business, San Francisco, Cal.

Notice is hereby given, that at a meeting of the directors, held on the 25th day of August, 1875, an assessment (No. 1) of twenty-five cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, No. 402 Montgomery street, room 9, second floor.

Any stock upon which this assessment shall remain unpaid on the 27th day of September, 1875, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Thursday, the 28th of October, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

C. A. JAMES, Secretary.

Office, 402 Montgomery street, room 9, San Francisco California.

Orleans Mining Company—Location of principal place of business, San Francisco, Cal. Location of works, Grass Valley Mining District, Grass Valley, Nevada County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 6th day of September, 1875, an assessment, No. 7, of one dollar per share was levied upon the capital stock of said company, payable immediately in gold coin of the United States of America, to the Secretary, at the office of the company, room 8, No. 315 California street, in the city of San Francisco.

Any stock upon which said assessment shall remain unpaid on the 7th day of October, 1875, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 28th day of October, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

GEO. P. THURSTON, Secretary.

Office, room 8, No. 315 California street, San Francisco, Cal.

Silver Wave Mining Company—Location of works, White Pine Mining District, Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 12) levied on the 31st day of July, A. D., 1875, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.

HARRISON'S LIGHT, VERTICAL BURR MILLS

BARBER & BACON, MILLERS AND LUMBER DEALERS, SOUTH VERNON, VT., write July 15th:
"We have been running two of your LIGHT VERTICAL CORN MILLS for the past 6 months with remarkable results, and have ground over 80,000 bushels of corn into No. 1 meal in that time, running the grist-mill nights only, as we run our saw-mill in the day time. We have often ground in the 20-inch Mill (which weighs about 500 lbs.), 1,000 lbs. of corn in twenty minutes, or 54 bushels in one hour. Our usual night's work is about 21,500 lbs., or 434 bushels. To do this we have to run at a speed of 1,300 turns per minute, and use about a 20-horse power. You may refer parties to us for further information, and when we have tested your HEAVY VERTICAL MILL, we shall take great pleasure in giving the results."

OF INTEREST TO
MINING COMPANIES.

A Mining and Civil Engineer, of long experience, collected in Europe and America, well acquainted with correct management of mines and mills, practised in projecting and constructing mining and milling machinery, and especially *machinery for mechanical ore concentration*, is open for re-engagement, and would prefer the task of constructing works for mechanical concentration of low grade ores on a well developed mine, or of remodeling ineffective works in the ore milling line for successful operation. Apply to Messrs. DEWEY & CO., or this office, for reference.

The Best Injector
For Locomotive and Stationary Boilers.
FRIEDMANN'S PATENT.
Over 15,000 now in use here and in Europe. Throws more and hotter water, with less steam, than any others. It has two Waterways, fixed Nozzles, and no movable parts to get out of order.

SAN FRANCISCO, SATURDAY, OCTOBER 2, 1875.

VOLUME XXX Number 14.

The Hall Treadle.

The sewing machine has been considered as the great labor saving invention of the age. It has certainly accomplished wonders and revolutionized the work of the needle. But it is a question whether the great gains achieved in its introduction have not been nentralized to a cousiderable extent by the injurious effects upon the health of our women. It is an acknowledged fact that the action of the nether limbs made necessary in working the treadle of a sewing machine, causes in many cases, diseases of the spine and back. Two or tnree years of stesdy work on a sewing machine is pretty sure to use np the average woman and make her an invalid for the remainder of her days. To obviate these troubles, the Hall treadle was invented, and it has proved as much a health saver as the sewing machine is a labor saver. With this treadle the power is applied solely by the downward movement of the foot, which pivots at the heel instead of the instep, while the rate of speed is regulated by the strength of these movements of the feet, and not by their number. This renders nunecessary that rapid motion of the limbs, on the part of the operator, which causes the entire body to sway and vibrate. Among the advantages claimed on behalf of this invention, the following appear to be the most prominent:

1. The great variety of motion allowed to the feet. The machine can be driven by one foot or both, or either alternately, the two foot pieces being independent of each other. A slow, alternate motion is generally preferred, which permits one foot to rest while the other is being brought down.

2. There are no dead levels. By the aid of the "pawl-and-gib" movement, the crank is entirely dispensed with, and the machine can therefore always be started without the necessity of applying the hand to the balance wheel.

3. The ease with which it is worked. There being no power wasted, much less force is required to move this treadle. To express the actual difference in figures, it has been estimated that while the force required to accomplish 150 stitches by the old treadle is equivalent to that necessary to raise a weight of seven pounds 165 inches, the same work may be done by means of this treadle by the force necessary to raise two and a half pounds sixty inches.

A company for the manufacture of these treadles was incorporated in this city several weeks since, and the Hall treadle manufacturing company will soon be able to supply the constantly increasing demand on the Pacific coast for this excellent invention. The manager, Mr. C. P. Sykes, has taken space in the Mechanic's Institute Pavilion, where the operation of the treadle is watched daily by groups of interested spectators.

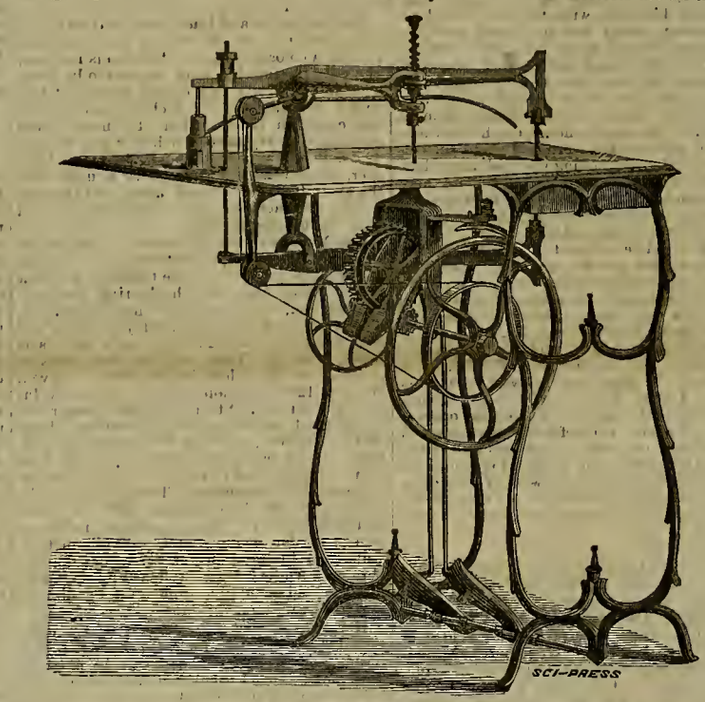
It is not to sewing machines alone that the Hall treadle can be applied. It drives with equal facility a jig saw and boring machine, and turns a grindstone with an ease that is difficult to imagine. The jig saw with treadle attachment for doing bracket and scroll work is particularly worthy of mention. We give an illustration of it on this page. As the lower and upper arm are alike, and the saw fastened in a spring head, and with a roller in the table back of the saw, a steady, upright motion is obtained, that leaves the work smooth, so that it requires no further finish. The saw-head is so arranged that any fine saw is easily adjusted, and requires no particular make of saws. An air pump or bellows drives the air through a pipe to where the sawing is done, and keeps the work free from saw dust, which would otherwise have to be dissipated by the breath of the operator. The boring attachment has all the adjustments usual in a boring machine. This saw works with ease; a lady can run it with a very little practice, in the same manner that she can run a sewing machine.

The grinding machine, of which we also give an illustration on this page, is a very handy thing to have about the house for grinding scissors, knives or tools, and to the farmer it is invaluable for sharpening axes and agricultural implements. Upon all of these grinding machines is a six-inch, solid Union emery wheel, which can be used without water, and does not heat or draw the temper from tools.

These several inventions are all deserving of notice, and we doubt not they will soon come into popular use.

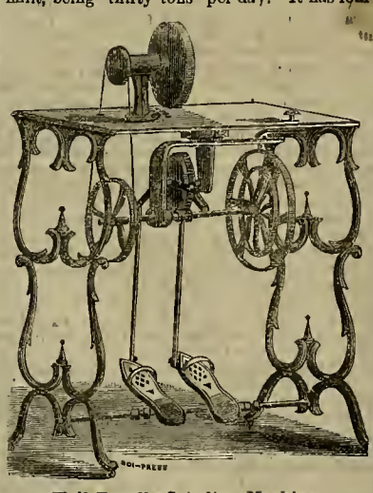
A Large Quicksilver Furnace.

They are now getting out the iron work at the Golden State iron works, in this city, for the largest quicksilver furnace ever built here.



HALL TREADLE JIG SAW AND BORING MACHINE.

It is a Knox & Osborne and Green furnace, modified by Mr. Winterburn; the condensers are of the Knox & Osborne pattern. The capacity of this furnace is greater than any yet built, being thirty tons per day. It has four



Hall Treadle Grinding Machine.

fires like the Green furnace, but they are put in differently. It is to go to the Wall Street mine, in Lake county, a few miles from the Great Western. Work has been carried on at the mine for the past twelve months, and the developments made warrant the outlay. The ore is not extremely rich, but they have plenty of it and think they can run one and perhaps two large furnaces continually.

The largest furnaces built here before this, were of twenty tons capacity, which, under favorable circumstances, could reduce twenty-five tons of ore per day. This, of thirty tons per day capacity, could be made to melt through thirty-five tons, or perhaps more. It is believed to be ahead of any quicksilver furnace yet built.

At this same foundry they are getting out two benches of retorts for mines in Trinity county. Three of these retorts are for the Altoona mine and five for the Boston. The Altoona is said to promise to become one of the leading quicksilver mines of the coast. With three small retorts they are now taking out 150 flasks of quicksilver per month. The ore is in sandstone, and is very rich and fine. In the upper diggings they wash out this fine stuff and concentrate it before retorting. With their extra retorts an increased reducing capacity will be given. It is the intention of the owners to erect a large furnace in the spring.

FRYER PROGRESS.—We understand, says the Nevada *Transcript*, of the 23d inst., that R. M. Fryer will have his machinery all in its place some time next week, and in about a week thereafter he will be in full operation upon his new process. The people will rejoice to learn this fact, as hundreds are waiting to hear that Mr. Fryer has proved all that has been anticipated. It is said the first lot of rock will be tried from the Providence—the biggest mine in Nevada county.

THE contractor has been experiencing considerable difficulty in driving the railroad tunnel at the Town Talk divide, near Grass Valley, owing to the amount of water encountered.

THERE are now about four hundred men employed on the Fulton and Guerneville branch road, and two and a half miles of track have been laid.

THE Petaluma *Argus* wants some enterprising parties to start a manufactory of agricultural implements in that town.

THE freight on a narrow gauge engine lately received from the East by the Stockton and Ione railroad was $1,800.

THE narrow gauge road between Alviso and Newark is now considered a certainty.

The Buckminister Drill and Air Compressor.

The Buckminister drills and air compressors are new candidates for public notice in the field of mining machinery. In both air compressor and drill, several new features are comprised, which are the inventions of Mr. Buckminster, of this city. One of each of these machines has recently been made by the Pacific iron works in this city, both being now on exhibition at the Mechanics' Institute Fair. On the drill, improvements are claimed on the turning and valve movements, and also on three different clamps. One of these clamps is for holding the drill on the tripod; another is for holding the drill tool in position; and the third for holding the weights upon the leg of the tripod. Ball and socket joints are also made on the two front legs of the tripod, making it very "flexible," so to speak.

The movement for turning the drill point, so as to present the cutting faces in a different position at each blow, is obtained by a notched sectional sleeve moving freely between two fixed heads of the piston, having two diagonal slots acted and operated upon by fixed lugs passing through the sides of the cylinder.

When the piston is on its down stroke the form of these notches allows the sleeve to turn full upon the piston. On the return stroke the faces of the notches slide upon each other, throwing the head out against the fixed head of the piston, and binding them sufficiently to turn the drill.

One of the clamps which is improved, is that for holding the sliding ways of the drill to its column on the tripod. This clamp is so constructed that the drill carriage can be turned clear round the column, and can also turn in a complete circle on the head of the clamp. The clamp is made with a hinge and hinged bolt, and has a sliding wedge, being so constructed that in turning upon this hinged bolt the clamp is made rigid on the carriage and also clamped rigidly on the column.

The drill chuck, or clamp, is peculiar, and needs to be examined to be understood. It holds the drill firmly in position, and, by relieving a bolt, the drill pulls right out by one turn of the nut.

Another improved clamp is that which holds the weights on the legs of the tripods. Usually the weights are secured with a key or screw. In this case an eccentric with handle is used, so that when the weight is moved up or down the eccentric relieves or secures it by a simple quick movement.

The air compressor is made compact and portable, and has several new devices. The principle of using water columns to compress air is an old and successful one. The features claimed by Mr. Buckminster are easily seen. He opens the induction valves mechanically and holds them open at the end of the stroke to obtain a full cylinder of air. Most machines open against the tension of a spring, and consequently the valve closes before it quite reaches the end of the stroke and before the cylinder is full of air. The eduction valves are equilibrium piston valves that work noiselessly. Another feature is a water governor to regulate the inflow of water to the machine, so that it will correspond in amount with the velocity of the machine. When running fast more water is needed to keep the air cool and keep the cylinders full of air.

The Pacific iron works have just commenced the manufacture of these drills and compressors. The outside of the drill presents a simple appearance, and the inside appears equally simple. The drill is so easily handled in the tripod with the new clamps that the inventor states it will put in holes in more difficult places than can be done by hand. Mr. Buckminster will be pleased to take the drill apart and explain its internal construction to those interested in such machinery. Its operation can be examined at the Fair, where it is being worked by the compressor described.

THE new tannery in San Diego is doing a successful business.

Gold Mining in Virginia.

A correspondent of the Richmond, Va., *Whig*, writes an interestiog letter to that psper, on the subject of "gold mining in Virginia." We make the following extracts:

The mining interests of this Stste are, in my opinion, of paramount importance to her people. A grand future ie certainly in store for Virginia, if the development of her mines only takes proper direction. While much may be done hy private enterpiise to give informstion and produce results in mining matters, yet this may prove too slow, and some other metbod should be adopted. Virginia should not wait for private enterprise to do everything when she has it in her power to help herself to a much greater edvantage.

In order to hring the subject of mining in this State advsntageously before the public, the Governor of this commonwealth should be authorized and directed by the next Legislature to appoint a commission of mining etatistics for the State of Virginia, with powers and duties similar to that of the United States commission of mines west of the Rocky mountains. It is not probahle that for years to come will Congress provide a similar office for that portion of the United States east of said mouuteins. Besides, it is too much area for one man attend to, if he is going to do it right.

States like Virginia, Pennsylvania, or North Cerolina, possessing as they do, such vast mineral resources, ought to have a mining commissioner of its own; and to do ample justice to the subject, each commissioner should have an aseistant, aud hoth should be competent men in every respect.

The reports of the United States Commissioner west of the Rocky mountains have done and are doing a vast amount of real good They furnish to the world a great deal of most valuable information that never would he obtained by private enterprise, except in the shape of costly books, or technical schools which can be reached hy only a few, comparetively.

A similar officer of this State could do more in two or three years to give publicity to the mineral resources of the Old Dominion, at less expense, and in a more effective way, than by any other course which, in my opinion, could be adopted. I earnestly hope that the next Legisleture will give that attention to the subject which its importance demands.

I will now proceed to give a brief, general history of gold mining in Virginia, noticing some of the principal oauses of failure in the past to make the orea pay a profit here as well as elsewhere.

Gold was discovered iu Virginia about the yeer 1831, and was firet obtained from "surface mining," as it is called here, and corresponds to the "placer mining" of Californie, and "gulch miuing" of Colorado.

Some Very Rich Deposits

Were found in the gravel beds along the streame, that paid well, and there can be no douht that there are more of euch deposits, ooly awaitiog discovery by the energetic applicstion of the inquisitive gold-seeker's pick and shovel at the proper points.

As is nsual, after such discovery the veius or lodes are found from which it is popularly supposed the gold is derived. Then commenced the introduction of macbiuery for the reduction of the ores, that promised well near the surface, which is usually the csse iu veins coutaining auriferous sulphurets. The same laws prevail here ss elsewhere in regard to the decomposition of the sulphurets in veins at or neer the surface, by which the larger portion of the gold is set free.

If the gold is modcrately coarse a good portiou of it may be saved by the older methods, involving the use of hides, blankets, shakingtables or sluices, but when the gold all occure in fiuely-divided particles it is more difficult to save, and eome other methods should be adopted to save the precious metal.

As water level is approaobed the sulphurets generally increase, and while there is as much gold in the ore, yet not so much in the free state, and the processes above mentioned fail to extract it satisfactorily. The sulphuret ores failed to yield bnt a very small percentage of the gold they were found to contain by assays. Various processes and devicee for seving gold more closely were tried. While some were very ingenious, they were not adapted to the purpose in view. The great point aimed at was to collect all the gold by means of quicksilver. Some olaim to have found out e method of saving nearly all the gold hy amelgamation, and I sincerely hope it may prove to be the case. Millions of dollars heve been expended in fruitless attempts to accomplish

This Great Desideratum.

The eame experienco was had in Californiia aud Colorado and otber Western mining sections in regard to processee for working sulphurets. There were very many failures, though the ore was rich. The people kept on trying faithfully, firmly helieving that a processa could he found that would succeesfully treat the large amount of rich ores that were wasting from the mille or were useless in the mines.

At last, in 1858, Mr. Deetken introducod the ohlorination procees ia Grass Valley district, and was very successful in working sulphuret and arsenicel ores, extractiug as high as 95 per cent. of the gold, as indicated by fire test. This may be considered the most succeseful prooose that hae been made public.

So far as I can learn no process hes been suocessful that is not hased on a thorough decomposition of the sulphurets, or arseniurets, as the oase may be, and this may he oonsidered as the mein oause of the feilures in working refractory ores both here eod elsewhere. Many methods were employed to hring the ores in contact with the quicksilver. Some aoted on the theory that the quicksilver would penetrate the sulphurets and combine with the gold, but they were doomed to disappointment. Some wasted the ore partially and then amslgamated, hut they did not produce the results so fondly hoped for. Even where the sulphurets are well decomposed by roasting, amalgamation does not succeed well

But useful information of some kind should always he gained from every failure in mining or metallurgical process. Some one is sure to he a loser in a fiaancial point of view, and some one ought to he a gainer of some useful facts. By investigeting the causes of failures valuable prsctical discoveries are often made, and by comparison of the differeut processes for the trestment of auriferous ores, we can fiud out the most economical and effective ones.

While in Colorado I nad an excelleut opportunity of comparing the results of the chlorination snd amalgemation processes separstely on on the same kind of ore, which contsined, when roasted, from three to five per cent. of copper. The psrty who made the experiment by amalgamation was an expert in the husiness, having had several years' experienee in California and Colorado, and was familisr with

All the Popular Methods

Of amalgamstion of gold ores, and he chose the "California hoiling process," as the one most likely to compete with or superoede chlorination, which I was tben working.

This expert weighed the ore very carefally snd was partiouisr to get it from the same mess where I did to fill my tanks for ohlorination. He ohtained a fine, large hall of amalgam, and was highly delighted with the reeult, and enthusiastically stated thet he would send the ohlorination works down the gulch. On examination it was found thet the nice, lerge ball of amalgam he had wae mostly copper, and when the gold was separated and weighed he found that he had not ohtained more than 40 per cent. of the usual amount hy chlorination. I did not near another word seid about the celebrated "California hoiling process" after that. The chlorination works treated all the ore there was on hand, and the mine being in litigation, the owners wisely concluded to raise no more ore until the case was settled.

I wish to relate a osse of inexcusable waste, which is another prolific source of failure io working ores containing precious metals. Some picked ore was seut from a Virginia mine to be treated hy a new amalgamator, for which the inventor claimed uuusual results. The ore in question contained iron and copper pyrites, some galena and was rich in free gold. The returu from the new machine was about $150 per ton. I asked for a sample of the tailings for assay, in order to see how close the ore was worked. I made a carefnl test, and obtained $188 per ton, coin value, which was lost by the new amalgamator. The parties for whom the ore was worked were not aware of the great loss aud seemed well satisfied, and thought the ore was good, and that the new machinery did very well.

Ventilating Coal Carooes.—The experience of the ship *Glory of the Seas* may be instanced es another case of the necessity of ventilating coal cargoes. This vessel arrived at Sao Francisoo lately, from Liverpool, with a load of Laucsehire coal, which, after a short time, presented startling evidences of spontaneous combustion. Her captain, being a practioal and observaut man, immediately adopted a system of ventilatiou, which, he asserts, was the only means of seving the ship. With open hatchee, together with takiug the precaution of having the ends of the lower snd middle decks open for thirty feet every three inches (she hae three decks), the coel was never so hot, even on the surfaoe, that it could not be handled It is thought, with some show of reason, that a more than usually lerge quentity of eulphur is present in this coal, ae eeveral ships laden with it, end houud to Pacifio ports, have recently heen destroyed hy fire. An intelligent recognition of the dangers of the sea, prudent provisions and vigilance, if not always able to obteiu the mastery over them, nevertheless serve to palliate disaster, wheu it comes.—*Nautical Gazette.*

One Effect of Bad Art.—One of the most obviously misohievous effects of had art is thet it leeds us to sec nature falsely. I have before me a beautiful hilly and wooded landscape of a peculiarly Americon type. I saw it for the first time not loug ago, and it has takeo me several deys of out-door life to see it as it should be seeu, and uot as the second-rate paintere have sceu it—not with a taint upon it of the conventional Americon landscape of the chromo order. The fact is that the painting of the chromo school does not really look like nature, although the distorted presentation iu it of some ooe phase of a landscape gives a certain falee air of likeness and reflects through the memory upon the original.

There was, lest night, over these hills a very beautiful moonlight. The moon was at the full, the sky was of a deep hlue, and the large clouds were tinged with rich and mellow color. But the pecnliar quality of the moonlight effecte, their veporous, unoertain messee and outlines, —this ie the very quality curiously absent from most of the pictures of moonlight effeot thet one sees in the galleries.—*The Old Cabinet; Scribner for October.*

Preparing for the Centennial—Progress of the Exhibition Buildings.

A oorrespondent of the New York *Tribune*, writing from Philedelphis under date of September 5th, says:

At the Centennisl grounds the work of construction coutinues to go forward with method and rapidity. The superetructure of the main building is all up, except the eastern fecade and the great central transept. Much of the glazing and painting has been done and the floor is partly laid. A system of decorating the columns, woodwork, and upper windows is being tested whioh promises brilliant effects, but is likely to err in the direction of too much color. The eye should not he diverted from the objects oxhihited hy showy ornamentetion of the buildiug. A method of lettering and numbering the iron oolumns that sustain the roofs has been adopted, and will serve as a directory to the plaoe of each exhibitor. The columns will be numbered lengthwise, and lettered crosswise. The address of exhibitors will be that of the column neareet to the street where their articles are displayed, and they will thus be readily found hy letter osrriers, telegraph hoys and visitors. For example, an exhihitor who gives his address as "Column D, 21," will be found in the fourth row from the side, and at the twenty-first column from the end of the building. This system has never been applied to any previous exhihition. The regular parellel gram form of the main building makes it perfectly practicable. Henry Pettit, the architect of this building and the Machinery hall, is its author. He has also perfected a system of accurately mapping out the floor space, so thet when the allotments are mede there will be no possibility of exhibitors clsiming the same territory.

All the granite aud brick work of the Art hall is finished, the iron skeleton of tbe dome supporting a colossal statue of America is iu place, and only the interior work remains to be done. The simple, quiet and chaste desigo of this edifice will delight the architeotural purists who oondemn tbe profusion of ornament and admixtnre of styles so much in vogue of late. The hall will appear to most advantage, however, when the huge temporary structures of the exhibitioo are cleared away, and its main front is seen across a broad level lawn covered with verdure and flowers.

The Maohinery hall is nearest to completion of any of the prinoipal structures. All the superstructure is up except the transept, and that is well under wey; and the flooring, painting, glazing, etc., are more then helf completed. The large room for the display of steam and rotary pumps and turbine water wheels is nearly fiohed. There will he eight lines of shafting extending lengthwise, seven to have a speed of 120 revolutions and one of 240 revolutions per minute. Steam and water power will be snpplied gretuitously to exhibitors. They will be required, however, to furnish such pulleys, counter shafts and helts as they need at their own cost, and to pay for erecting foundations for their machines. The latter must be finished hy the 1st of Maroh, 1876. A space will he reserved for steam hammers in operetion, and for heating aud working metels. Rules and information for exhibitors of machinery have just heen published by the Commission, and should he applied for by all prospective exhioitors.

Hortioultural hall now shows a nearly oompleted skeleton. In a fortnight more the iron outlines of ribs and columns will he filled in with glass. On Agricultural hall tbe work is still principelly prosecuted in the shops where the material is prepared. The foundation is ready, however, and the workmen have begun to put up the superstructure. The United States Government huilding, whioh ranks in size next to the four buildings named above, is already far advanced, and will be finished hefore winter. Bids for the erection of the Women's pavilion have been received, and the contract will he given out in a few days. The limit of cost is $30,000. The Jury pavilion, ooetiug $45,000, will also be soon under contract. It will contein, hesides rooms for jury meetings, a large hall for the use of scientific bodies, international congresses and other assemhlies, aad a uumber of rooms for newspaper reporters. A quaiat structure in the old Eoglish etyle of architecture—brick and heevy timber mingling in the walls—is going up at the foot of George's hill. It will be used hy the British Commission for offices. A drawing for a building for the Imperial Germsn Commission has been prepared by Mr. H. J. Swarzmenn, Architect of the Centennial Commission, and forwarded to Berlin for approval. It repreeents a handsome structure of a single lofty story, reeembling somewhet the pevilion of the Auetriau Emperor at the Vienna Exhibition. A number of State Commission buildings will line tbe road at the foot of George's hill. Penneylvania, New Jereey, Indiena, Illinois and Kansas have already made arrangements to put up offices for their Commissions, aud other Statee are expected to follow their example.

Conoessions for four restaurante have heen granted, all to be kept in hendeome and unique buildings erected expressly for the purpose. The Freres Provenceaux will establieh a branch of their Paris establiehment, and will have a rival in Frenoh cookery in M. Surdreau, of New York. P. J. Lauher, of Philadelphia will keep a German restaurant, and Mr. Meroer, of Atlanta, Ga., an Americon one, which will probahly he a sort of headquarters for Southern visitors. Several other applicstions remain to be acted upon. The Commission desire that there shell be at least one restaurant where all peculiarly American dishes will be cooked in the best manner and mede specialties on the hill of fare. Locations will be assigned in the course of the next two deys to a number of small structures—amoog them a Moorish villa, a Turkish coffee house, and two or three newspaper offices.

It has not yet heen decided whether the exhihitions of horses, cattle, sheep and swine will be held on tbe restricted grounds near tbe Agricultural building or in some ampler area outside of tbe park. The dete for opening the show of horned cattle is fixed for September 20th, 1876, and it will last fifteen days. From a circular issued by the chief of the Bureau of Agricultnre I learn that it is assumed that 700 head will cover all desirable entries, and upon that haeis will be caloulated the number of stalls which will be apportioned esoh breed. The scale divides the aggregate number into ten parts, and of these four-tenths are assigned to shorthorns, two-tenths to Channel Islands, one-tenth to Devons, one-tenth to Holsteins, one-tenth to Ayrshires, and one-tenth to animals of other pure breeds. The exhibition in each breed will comprehend animals of various ages, as well as of both sexes. Draft and fat cattle will he admitted irrespective of breed.

Ground for tbe competitive trial of reapers and mowers has been secured on the line of the Pennsylvania railroad, between Philadelphia and Trenton, near Schenck's stetion, an excellent site on account of direct rail communication with the Centennial grouods. American reapers and mowers have excelled st all competitive triels in Europe, and have control of all the markets of the world; it is therefore scercely probable that foreign machines will be sent here to compete with them on their own ground. In the steam plowing matches, however, the English will have the field to themselves. Three or four prominent msnufaoturers are expected to meke the most of this opportunity to introduce their machines, which are admirably adapted for Western prairies.

The Land of Horse.

A correspondent writes: The moment you enter the famoua Blue Grasa region you hear nothing but horse talk. The whole section lives upon pedigrees. The stahle boys hanter pedigrees in a nomenclature of their own. The men utter pedigrees with a volubility like the flowing of a never-ending stream. Even the ladies of polite society will chatter pedigrees, and talk as fluently of eire and dam as if they had received their accomplishments in the precincte of the breeding portions of the stock farms. Everywhere it is horse, mare, filly, foal, gelding. The stables are swarming with them, the streete ere alive with them, the fields are dotted with them like the cattle on a thousand hills; and the visitor, even though he came merely to see, hss a secretiveness and obstineoy more profound than the mysteries of the Sphinx, if he does not buy, before he comes away, some little equine specimen, for which he has no earthly use. There is a certain Freemasonry or brotherly love among the horse deelers of Kentuoky. If one breeder has nothing in the horse line to answer your demaods, he will furnish you with a saddle-horse and accompsny you for miles around the neighborhood to inspect stock whioh he is sure will just suit your fanoy. Their houses are thrown opeu to your entertainment. The rareet wine of corn and the freshest of mint, and the richest of Alderney cream and tenderest of spring chickens are offered with a princely generosity to feed the flame of your horse fever, which must not he allayed till you have left your money behind you on some of the stock farms. That is the logic of all the attentions and pedigrees and horse enthusiasm, and it is wonderful how the interest is kept up year after year, and how the surplus funds of our wealthy horse fanciers are poured, with an increasing volume, into the coffers of the stock raisers of the Blue Grass region.

The Hoosac Tunnel.—The Boston *Journal* has the following in reference to work at the Hoosac tunnl: "The enlargement of the little tunnel, to meet the requirements of the increased travel, was begun Maroh 1, and it is hoped to finish the work in two months, more: The objects of the undertaking are to lower the grade eight feet, to widen the roadwey eo as to accomodate two tracks, and to alter the direction in order to lessen the sherp curves of the road at both approaches. The new tracks will curve elightly through the tunnel, and the curves at the entrance will he reduced. The new width at the level of the tracks will be twenty-four feet, an increase of ten feet. The length of the tunnel is 370 feet. The debris is taken seven or eight miles down the road and used for rip-rapping. The rock is mica elate and needs no arching. The Governor and Council are about closing another contract with B. N. Farren to continue the work on the big tnnnel under the appropriatioos of the last Legislature. The old aad new contracts together amount to about six hundred thoneand dollare. The work is progressing at the rate of about 275 feet a month, and consists of enlarging, both in width and height, and arching with brick where the stone is soft and liable to fall. Mr. Farren found the bore twenty-four feet wide and twenty feet high, and leavee it thirty feet wide and twenty-three high. The work will probahly be done in about a year from now, it heing expected that the new appropriation will finish it up."

MECHANICAL PROGRESS.

Compressed Steel.

In the ordinary practice of the manufacture of steel, as now conducted, the metal is cast into large ingots and subsequently submitted, in a heated state, to pressure between rollers or to severe hammering. This rolling and hammering is found necessary in order to remove the little hollows or bubbles which are always produced to a greater or less extent by the gases present in molten metal, and also to unite more closely the crystals which are formed during the process of cooling. But this work, at best, can be but imperfectly done by such a rough process which acts only on small portions of the mass at any given time. Moreover the nature of the metal is such that it requires to be dealt with gently at first, becoming fit for more severe handling as it increases in homogeniety and toughness. It is found, after all has been done that can be reached by this process, that the metal is far from being perfectly homogeneous. The bubbles which usually form near the surface of the ingot are liable to be opened up, in the process of hammering and rolling, to the entrance of air and dust so that scale and foreign substances materially interfere with the production of a perfect steel. These imperfections are readily perceived in the serrated edge of our best razors and other cutting instruments, which the microscope so readily reveals.

To more fully remove these imperfections, pressure has recently been applied to the ingot while in a molten state, and since iron naturally contracts during the process of cooling, the application of pressure to increase that contraction is certainly a most rational one; but the great difficulty heretofore has been to reduce the idea to successful practice with the use of a high degree of pressure.

Pressure to increase the solidity of metals while cooling has been employed in England for more than twenty years, especially in its application to copper; but the credit of its first application to steel is due to Mr. Bessemer. He, however, merely embodied the idea into one of his earliest patents, while Messrs. Revollier, Bietrix & Co., of France, were the first to erect steel works for its practical application. This was done in 1867, and in connection with the Seimens-Martin process. A late number of *Engineering* gives a detailed description of the various experiments which have been made in this direction from which we have gathered the following facts:

It was soon perceived, in the experience of the firm named, that the Seimens-Martin converting process did not admit of the best necessary to secure the proper degree of liquidity after the metal had reached the molds, to obtain the desired results in removing the bubbles. In order to overcome this difficulty, a steel was employed containing a higher percentage of carbon, and hence a lower melting point; but here a new difficulty was encountered in the hardness and brittleness of the resulting metal. These complications resulted in a failure to produce a superior compressed steel at these works.

A better success has attended the experiments of Herr Von Stummer-Traunfels, at the Neuberg works in Austria, which were conducted in connection with the Bessemer converting process. This improved result is mainly due to the fact that the initial temperature of the molten metal — its temperature when it leaves the converter—is much higher than in the Seimens-Martin process. This fact and its importance being fully realized, hydraulic appliances were devised and put into effective operation at these works, by which a pressure of from 400 to 700 tons upon the top of the ingot was rendered practical. Not having the exact superficies of a section of an ingot, we are unable to state the pressure per square inch.

But still more important is the progress in this direction achieved by Sir Joseph Whitworth, in his works at Manchester, England. He has there in operation the most magnificent and complete works for producing compressed steel yet erected. Among his appliances are four hydraulic presses capable of exerting pressure as high as 8,000 tons. He has appliances for compressing not only ingots, but various other shapes, and notably rings, such as are employed in the manufacture of his heavy ordnance.

In the production of crucible steel he usually applies a pressure of six tons to the square inch, during which pressure the ingots are reduced one-eight in length, a small fraction of which reduction is due, however, to the expansion of the mold by the heat of the molten metal and the enormous pressure applied.

When the pressure is first applied there is a slight escape of molten metal around the plunger, but the solidification at the vent soon prevents further leakage of the metal, while, as the pressure goes on, there is a copious discharge of gas, principally carbonic oxide. In case of small articles, Sir Joseph has applied a pressure of even twenty tons to the square inch. Masses of very great weight are compressed at these works. A propeller shaft of compressed steel, which, when finished, weighed eighteen tons, has been turned out at these works. Also a lining for an engine cylinder, fifty-nine inches in diameter, forty-four inches long, and one and three quarter inches thick. The introduction of compressed steel is a most important advance step in the progress of the iron industry.

Needed Inventions.

Somebody says women cannot invent, however well they could vote. Here is something in their own line. Come, girls, don't fail to show your genius, and make your fortune to boot!

The *Sewing Machine Journal* gives the following list of inventions in which great improvements can be made. There is great need, it says, of these specified, and also great room for advancement. Doubtless a fortune can be made on them if properly managed:

1. A ruffler which can be set to gather a given fullness.
2. A simple embroiderer.
3. An adjustable scroll binder which will not stretch the binding.
4. A practical adjustable hemmer, from the smallest size to an inch wide.
5. A rotary shuttle sewing machine, which will not twist or untwist the thread, and which will sew with great rapidity.
6. A practical tuck tolder.
7. A sewing machine which will have in its working parts the different attachments which can be thrown in gear with some working part of the machine when the attachment is required.
8. Motive power.
9. A good needle threader.
10. A glass oil bottle which can be sold cheap, and used to oil the machine instead of the oil can. It must be made so that the oil can be forced out.

Ships' Sheathing.—Experiments made with a view to determine as nearly as possible the causes which produce deterioration of ships' sheathing show conclusively that different seas act differently on the sheatbing, and often weak or diluted sea water more than strong, as that at the month of rivers sheathing is often found to wear more rapidly than out at sea In these experiments, as made by M. Prideaux, the various ingredients of sea water were taken alone, and mixed in different proportions, but the gross quantity of the salts in the water being always three per cent. of its weight, the results were that the chlorides acted more rapidly upon the copper than the sulphates. Of the chlorides, that of magnesia acted most, calcium next and sodium the least. Accordiog to Prof. Graham's investigation, chloride diffuse more rapidly than any other salts. This may give a preponderance of such salts at the months of certain rivers, and may have a tendency to increased wear occasionally in such places. It is well known, of course, that the quantity of salts held in solution in sea water, except in such as the Dead sea, is on an average from 3 to 3.8 per cent. of the weight of the water.

A Mechanical Scarecrow.—An automaton scarecrow on exhibition at an English fair is described as a self-acting machine made for the scaring and frightening of birds. It fires guns at regular intervals by means of clockwork. It is so constructed that it can be charged and put to work the evening of one day to commence firing at any hour of the next, and will continue firing at intervals all day without requiring further attention, or it can be set firing immediately. It is fitted with a self-acting apparatus to stop the clock work as soon as the last gun is fired, or at any hour required. As an alarm apparatus, for the protection of plantations, game preserves, farm yards, etc., it must be of great value, as it is so simple that any lad could regulate it.

A new tramway locomotive is being experimented with on a private tramway, at the quarries of Avron-Neuilly, near Neuilly-sur-Marne. The motive power is compressed air, mixed with steam. For a journey of three-eighths of a mile, with twenty-five passengers, a charge of 800 litres of compressed and heated air is found to be sufficient, the vehicle weighing 4,500 kilogs. The journey is made without noise or smoke, no steam is given off, and stoppage is easily effected.

American Locomotives in Russia.—There are now eighty American made locomotives in Russia. They are coal burners, and much larger and more powerful than the small wood-burning locomotives heretofore built in Russia or imported from Germany, France or Belgium. The American locomotives cost 25,000 silver rubles each, and the German locomotives 18,000 to 20,000 rubles, but the American locomotive is fifty per cent. more powerful than the German.

Washing Smoke.—An apparatus for washing smoke, and so depriving it of its character of a nuisance, is in operation at a factory at Meuil-montant, Parie. A fine shower of water, travelling in the direction of the smoke, and at five times its velocity, is projected into the chimney, where it mixes with the smoke, taking up the soluble gases and precipitating the impurities carried up with the smoke by draft The foul water is discharged into a cistern, where it is collected, and a fine black paint is got from it.

SCIENTIFIC PROGRESS.

Mr. Crookes' Late Discovery.

Our readers will readily call to mind the description given some time since, in these columns, of a late discovery by Prof. Crookes of a singular phenomena in regard to light, wherein when a ray of sun-light was made to fall upon a set of arms delicately suspended upon a pivot, said arms were put in motion in a direction opposite to that from whence the ray of light came. Hence it was inferred that rays of light possessed force to a certain extent, similar to falling water. It was at once seen that if this explanation of the phenomena was substantiated a material modification in the present dominant theory in regard to light would be required. Hence Prof. Crookes' explanation was received with considerable doubt, and scientists set themselves to work to furnish, if possible, some other explanation which would be in harmony with universally acknowledged principles.

Professor Dewar, of Edinburgh, among others, repeated the experiments of Prof. Crookes', and studied them with much care. The result of his observations was a conclusion that the movement of the suspended arms was due to the action of the obscure or heat rays alone, and that the rays of light had no influence whatever upon them. This was readily proved by separating the rays of heat from those of light, as is readily done by causing them to pass through certain substances. Thus when any substance was interposed between the suspended arms and the sun which would absorb the heat rays, the arms remained immovable; while when a substance was interposed which admitted the passage of the rays of both heat and light or heat alone the arms would revolve.

The experiments made were numerous and simple, and do not seem to admit of any doubts of the correctness of his conclusions; neither do they involve any new or inexplicable phenomena in regard to light.

What takes place from the action of the heat rays upon the suspended arms is described and explained by Professor Dewar substantially as follows:

Particles of gas are flying about in all directions, with a velocity which depends on the temperature. When they impinge on arms heated as they must be in this experiment, they go off with a greater velocity than those which go off from the colder side, and hence there is a recoil of the arms.

Those who have dreamed of securing a profitable direct motive power from solar radiation, will see from the above that they are doomed to an inevitable disappointment.

A New Theory of the Origin of Rocks.—The most recent deep sea soundings have proved that the grand areas of the general sea bottoms of the Atlantic and Pacific oceans are similarly constituted of a girdle of calcareous mud, of indefinite depth, formed by a similar vein of discarded calcareous shells of animals of low organization—the foraminifera. This white calcareous matter of the foraminifera shells is replaced in certain deep oceanic valleys, for instance between Tristan d'Aonnha and Kerguelen's land and elsewhere, by a very fine red clay. In certain geological deposits, of greater or less antiquity, beds of glauconite or green siliceous sand exist, which are constituted entirely of the casts of ancient foraminifera formed of a green material, which is a compound of silicate of iron and alumina. Chemists have found that the red mud is the accumulation of a small percentage of clayey matter, resulting from the wholesale decomposition of the calcareous shells; clay deposits can therefore be assigned, like siliceous and calcareous deposits, to the resultant debris of organisms living at the surface of the sea. Supposing therefore that the whole globe was immersed under an entire envelop of water, deposits of all the materials of our stratified geological rocks could be going on without the slightest resistance from the degradation and wearing away of any actual land surface at all; and these deposits, subject in the ordinary natural course of events to ordinary processes and actions, could be modified into gneiss, schist, slate, limestone, and every variety of geologic rocks.—*Ex.*

Artificial Production of Precious Stones.—An address on clay and its economic application was delivered by Prof. T. O. Archer on the occasion of the inaugural meeting of the fifty-fourth session of the Royal Scottish Society of Arts at Edinburgh. The President commenced by a reference to alumina and its various alloys. One of the greatest discoveries of the present age, he said, was the obtaining of the oxide of alumina in a pure crystalline state. It has long been known that the precious stones were composed of oxide of alumina colored by other metallic oxides; and it was a very fair inference that if they could succeed in melting the oxide alumina, there was nothing in the world to prevent the manufacture of emeralds, rubies, sapphires, etc. This had actually been accomplished by a Parisian chemist, and the artificial gems were of the same hardness and density as, and chemically identical with, the real stones.

Why Do the Clouds Float?

For too long a time the scientific world has believed in the idea of De Saussure—that the water particles of which clouds and fogs consist are vesicles, analogous to soap-bubbles, consisting of a watery envelop, with a vacuum inside, so as to be specifically lighter than the air. It is strange that the fact is continually being overlooked that if particles are only small enough they may be kept up in a liquid or gas, notwithstanding the material of which they are parts is considerably heavier than the medium in which they float. Powders of heavy material may be kept up in water for days and weeks, as those who prepare polishing powders know. The finest emery is only obtained from water from which the coarse particles have been deposited in different periods of time, according to their fineness, when at last, after collecting the deposits of many hours, and even days, the very finest parts do not settle until after many weeks' rest.

It is the same in the air; if we collect the dust deposited in a room which has been closed for some weeks, and examine it, we will find it all to consist of particles of very heavy materials, and if machine shops are in the neighborhood, even metallic dust will be recognized.

Now when heavy metallic dust can be carried in the air, why not water dust, which is much lighter? In viewing the grand falls of Niagara, we have noticed that, when the atmosphere was not too dry, so as to cause the spray to disappear, while the sky was covered with loose floating clouds, the spray in ascending formed a cloud identical to the others, with which it floated away.

The height at which clouds will float depends chiefly on the *size* of the watery particles; the larger they are the lower the clouds will float. This was recently verified by Mr. Angus Smith, in Iceland, where he observed a cloud or fog rolling down the streets like dust or smoke; it came from the sea, and the particles were larger than any he had ever seen before, being about one 400th of an inch in diameter. He did not find the particles hollow, but concrete throughout, and in his account refers also to the absurdity of the theory that the cloud particles should consist of hollow spheres or vesicles.

The power which hold small and heavy particles up in a liquid or gas, is simply the adhesion, which increases with the surface. The finer the dust the larger is the surface as compared with the volume, and when the adhesive action of the liquid or gas on this large surface is great enough, it may overcome gravitation, and the particles can not fall, but will be kept floating.

That there is a strong adhesion between air and water is proved by the effect of wind on the surface of water, especially when compared with the effect of the wind on a watery surface lubricated with a film of oil then the air glides over it without causing even a ripple. On this depends the quieting effect of oil when poured on turbulent waves when they are caused by wind. Oil poured on the waves of the rapids of the St. Lawrence river would by no means have that same quieting effect.—*Am. Manufact'r.*

Light Observed in Grinding Hard Stones.—At the agate polishing establishment in Oldenburg, a phenomenon has been observed for the past century that has as yet, perhaps, attracted too little attention from scientific men. Under very powerful friction, such as only can be produced by the machinery at those works, hard stones become splendidly luminous and transparent throughout. In this establishment the axis of an undershot water wheel reaches into the grinding room, where four or five grindstones rotate vertically; over each is brought a gutter, so that a constant small stream of water pours upon the stone. When grinding, the workman lies braced against a post and with both hands presses the stone to be polished firmly against the grindstone, bringing his whole weight to bear upon it. Some experiments were made in this workshop by Noggerath in broad daylight. He observed that as long as a stone of the hardness of quartz was pressed against the revolving grindstone there was produced an intense red light, which at the same time radiated around the object and emitted numerous sparks. This experience was the same with all hard stones, which appear almost like red hot iron, and it really looks as if the hands must be severely burnt. All the stones become warm in grinding, but not very hot. Chalcedony gave a magnificent fiery red light; chrysoprase, a little red light; rock crystal, a beautiful rose red; coralline, a superb red light, the color being evidently increased by the natural hue of the stone. Amethyst gave a pale violet, while numerous opaque stones gave no light at all.

A Wonder.—It has been discovered that when water is strongly acidified with hydrochloric acid, with a small part of benzole, and heated, it was found that it boiled and rested at regular intervals of a minute. Then, after stopping a long time entirely, boiling began again, with the like intermissions as before, but of half a minute. Thus, in a regular series, till it ceased altogether. Savans consider it a profound wonder.

A Curious Mineral.—In the veins of copper pyrites occurring at Ykouna, in Japan, shining black nodules are found of the size of a man's hand, containing about twenty-four per cent. of water and twenty five per cent. of bituminous matter, which yields on assaying 310 grms. of silver, and 190 grms. of gold to the ton. The density of the mineral is 2.13.—*Annales des Mines.*

A New Flexible Shaft.

In the northeast corner of the Mechanics' Fair is exhibited a novel mechanical apparatus, which, on accnnt of its peculiar working, attracts mnch attsntion,. It is simply a flexible rod or shaft, one end of which is attached to a small pulley, over which a band running from a larger pulley passes; the othsr end being so shaped as to be conveniently attached to an augur bit, emsry wheel, grindstone, or anything reqniring a rotary motion.

In size the sheft may be from one to two iuches, or larger or smaller as, desired. It is made sntirely of the best steel wire; e number of wires rnnning straight through the center, while around these, and iu opposite directions, are closely coiled two wires, thereby giving it the same strength, whether revolving to the right or left. In handling it some would think it perfectly solid, but it can be coiled about the hand and bsut about with almost as much ease as if it were india rubber.

This shaft is encased, and revolves in a leather or rubber tube, and, when in opsration, only the pulley at the one end and the hit or wheel at the other, is seen moving. There is therefore, no danger of any garment getting sntangled about it.

This invention is pstented under the title of the "Patent Flexible Sheft for mschanical purposes," and will, no doubt, prove of great ntility to ship and house carpenters, oabinet makers and in sll kinds of work to be operated on, at a distence from the motive powsr, or thet is difficult of access on account of peculier construction. It will admit of heing coiled once or twice around a piece of wood, and at the same time bore a hole through it. The length may be suited to the kind of work to be done, though, of course, the longer tbe shaft tho more strain there will be on it, and heuce a long sheft must be made heavier and stronger than a short one. It is exceedingly convenient in its appliance. Mr. N. Stove is the patentee and Mr. W. H. Kellay, of Sacramento, is owner of the right for California.

Monster Steer.—The Oregon and Northern California papers mention a monster steer reised by a Mr. Miller, in the Klamath Lake section, whioh ie claimed to be the largest ever grown. He calls him the "Lost River Renger," is 19 hands high, 20 feet from tip to tip, and calcnlatsd to weigh, when fat, 5,000 pounds. He is said to be the largest animal ever witnessed, next to the elephent. Mr. Miller also intends taking him to California this winter, where he will fatteu him and tske him to the Centennial.

The Mining Share Market.

A marked improvement has heen manifested in the mining share market since our last. Transsctions are numerons and stocks generally are strong and active. The Bank of California opens on Saturday, the 2d of October, with over $3,000,000 in its vaults. The Bank of Nevada will open its doors on Monday, and San Francisco Stock Board and Pacific Exchange will recommence their sessione the dsy following. We give below the prices of some of the leading stocks yesterday (Wednesday) in the California Board: Best & Belcher, $42¾; Belcher, $18½; Crown Point, $23⅝; Gould & Curry, $17¼; Hale & Norcross, $40; Justice, $36½; Mexican, $19; Ophir, $53⅛; Sierra Nevada, $13¾.

Assessmente have been levied on the following stocks: Washington & Creole, Yellow Jacket, Gold Rnn, Kelsey, Howard Hill and Florence.

In epeaking of the Comstock, the Gold Hill *News* says that the mines never looked better, generally speaking, and people generelly are growing more and more bnoyant in the feeling and idees in view of better times coming shortly. All are weiting petiently for the "good time coming."

The receipts of the San Francisco Committee for the relief of sufferers by the French floods amounted last week to $249.50, including $120 from Portland, Oregon, $101.50 from Victoria, and $6 from San Francieco. The grand total so far is $15,606.95.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

From Official Reports for the Mining and Scientific Press, DEWEY & CO., Publishers and U. S. and Foreign Patent Agents.]

By Speoial Dispatch, Dated Washington, D. C., Sept. 28th, 1875.

For Week Ending September 14th, 1875.*

Ore Feeder.—Chas. P. Stanford, S. F., Cal.

Ore Crusher and Amalgamator.—Charles Braids, Copperopolie, Cel.

Invalid Lounge.—Andrew Shields, Portland, Oregon.

Sphygmoscope.—Wallece R. Pond, Stockton, Cal.

*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Thirteen thousand fresh troops have been sent from Spein to Cuhe.

The new Board of Truetees of the Lick fund have organized by the election of R. S. Floyd, President, Faxon D. Atherton, Sr., Treasurer, and F. Ward, Secretary.

MINING SUMMARY.

The following is mostly condeused from jonrnals pnbished in the interior, in proximity to the mines mentioned

California.

AMADOR.

The Good Hope.—Amador *Dispatch*, Sept. 25: Work on the Good Hope mino near town is still heing pushed forward with nnahated vigor both day and night. Mr. Peters is confident that every days' work brings him nearer to the great "bonanza" which is undoubtsdly located in the vicinity of the bottom of the shaft.

The Eureka.—*Foothills Ensign*, Sept. 24: The Italian contractors who undertook to sink 200 ft in this mine at $10 per ft, threw up the contract on Saturday. They had been working for ahout 26 days, during which time they sunk 52 ft. The rsason for qnitting work was that the price was not sufficient to pay them. On Sunday morning another force of 6 minera commenced sinking at $15 per ft. They expsot to get down the remaining 150 ft in about 8 weeks..

New Mine.—Some 10 years ago, when Dry town was in its palmiest days, C. C. Belding sunk a shaft on a mineral claim located by him, and sfter reaching a depth of 80 ft, with cheering indications, work for some reason unknown to us was bronght to a standstill, and the cleim has remsined idle ever since until 2 weeks ago, when Belding commenced draining the shaft, with the view of further development. On Tuesday last ha startsd drifting, and took out rock of a first-class character. Some of the specimens brought to Sutter crsek are speckled with gold, and would yield, at a low estimate, from $12 to $20 per ton.· Tha ledge is said to be 3 ft thick, with well defined hanging walls. The gulch just below the location yielded large quantities of the precious metal in the early times, which faot is not unfavorable to tha existence of a rich quartz vein. If the prospsot continues as at present, the owner will arrange for the erection of a 10-stamp mill at an early date.

BUTTE.

New Flumes.—*Mercury*, Sept. 24: Two new flumes are being made that will run from the Hewitt claim on the bluff to the river. On Tuesday we took a look at ona of them, about 1,500 ft in length, 4 ft in width and 30 inches in dapth. The wood work is under the cherge of John Norton, who is pushing it as fast as possible. Just behind him is J. C. Bierce, hard at work laying the blocks, which are about 15 inches square and 6 in thickess. A part of the way has to be tunneled, and Thomas Young has a crew of Chinamen at work blasting on the old tunnel, so that it will be wider and deeper. As soon as this finme is done the craw will be put at work on the other, which will be some 2,000 ft in length and of the same dimensions otherwise as the first finme. It will probably take something over a month to complete the entire work, hnt when done it will donbtless be one of the best pieces of property in the county. The company has an abundance of water and acres of rich ground.

Mining.—On Sunday lsst we took a walk to the school house to see how far along the workman had got the new part. The trnstees are having a well dug in the reer. It had reaohed a depth of about 20 ft. A couple of Chinamen were at work with a rocker washing the dirt that hsd bsen thrown ont, and from what we saw in a pan, they would make a good day's work of it.

CALAVERAS.

Mosquito District.—Calaveras *Chronicle*, Sept. 25: The Ashlsnd and Lewis & Fairchild mines are taking a short rest, but will be soon in full blast again. Both mines show large quantities of excellent ore bedded in a splendid slate formation. The former Vance mine is being vigorously worked with excellent results. San Bruno ss usual.

West Point District.—A new superintendent for the Josephine, has arrived. Work will be resumed at an eerly day. M. Carey ie cleaning ont and repairing an old tnnnel for the purpoee of draining the sorface water from hie new shaft on the former Doyle mine, hie machinery not heing of sufficient capacity to contend with the heavy flow of water. Pryor & Co., are still in rich ore. Plenty of ore, which shows considereble free gold, hes been etrnck in the Cheeno. The Cheeno is nearly due eouth of the Good Faith and apparently on the same lode. The Good Faith, one of tho most promising minee of the district, is idle at present, bnt it ie expected that it will etart up again soon. Henry & Co. are running a substantial tunnel on the former Soaproot. Contractore are repairing the old Valentine tnnnel.

Mosquito Gulch Quartz Items.—The new shaft in the San Bruno, from the eurface to the upper tnnnel of the mine, snnk for the purpose permitting the smoke from tha engine to eecepe, is completed. Work is now going forward aa usual, operatione being principally confined to stopeing from tha 300-ft west level. The ore extracted ie of good quality, and is being got out in large qnantities. Garland's mill is now crnshing tha rock. A very rich discovery wes lately made by Mr. H. W. Potter. He has found a ledge the croppinge of which prospect from $300 to $400 per ton. The lead is narrow on top, not exceeding ten inohee in width, but it will probably show increased thickness as

development progresses. The rock is the richest ever discovered in the district, and the "find" is creating considerable excitement. Good rock is being taken from the Rickman mine. The shaft is now sunk to the depth of about 70-ft and stopes have been opened. No trouble has yet been experienced from water. Favorable developments have recently been made in the Albers mine. A rich vein has been cut by the tunnel, although its objective point is not yet reached. It is rumored that the well known Grasshopper mine has been sold to the proprietors of the Josephine, at West Point, for $3,000. The Grasshopper was worked down to water level several years ago, when operations were suspended in consequence of the inadequacy of the machinery. If we recollect right the lost rock taken from the mine milled $160 per ton. At all events it is one of the richest veins in the district, and we hope the report that it has fallen into hands capable of working it to advantage will prove true. Garland's mill is now employed on San Bruno ore and rock belonging to Messrs. Barney & Rogers.

An Important Mining Enterprise.—One of the most notable gravel mining enterprises ever undertaken in the county has been lately inaugurated by the Messrs. Cook & Haywood—practical miners, well known for their energy and activity in promoting such operations. The object of the undertaking is the working—by the hydraulic method of washing—of an extensive deposit of gravel, located on the south side of the Calaveras river nearly opposite Rigney's ranch. The first thing to be secured, in carrying the enterprise into effect, was an adequate supply of water, to be conducted at a sufficient hight above the gravel bed to be available for hydraulic purposes. To accomplished this necessitated the digging of a ditch to tap Jesus Maria creek, about 5 miles distant, an indispensable adjunct of the enterprise that called for a large outlay of capital at the outset. Work was commenced upon the ditch several months since, and it is now over half completed. Thirty men are employed in digging it. Its dimensions are: 3 ft wide at the top, 30 inches on the bottom and 2 ft deep, with a grade of 6¼ ft to the mile. The carrying capacity of the ditch will be in the neighborhood of 800 inches, and the water it conveys, when directed against the gravel bank by means of an iron pipe and nozzle, will have a pressure of about 200 ft. We can see no reason why the enterprise should not prove an extremely profitable one. The gravel deposit is extensive and rich, water will be free and all the facilities for working the ground excellent. It is expected to have everything in readiness for active operations, with the earliest rain fall, and we shall be disappointed if the projectors of the undertaking are not well rewarded for their energy and enterprise.

COLUSA.

Quicksilver.—Colusa *Sun*, Sept. 25: We have frequently spoken of our wealthy quicksilver mines in the Coast Range, and we are assured by proof most positive that our ideas were of not too high a character concerning them. A few days ago 33 tanks were taken from the Abbott mine, from a clean up of 7 days run. It is confidently believed this will be increased by the next clean up.

INYO.

Good Prospects.—Inyo *Independent*, Sept. 25: Mr. Holt, of the Consolidated Virginia on Kearearge mountain, is preparing to ship a lot of high grade ore from some ledges on the north side of the mountain on Oak creek. These are the same ledges upon which the irrepressible Jimmy Sharp has been operating at times for several years past, and out of which, with common blacksmith fires and similar means, he has smelted many a small bar of fine bullion. Jimmy is at work there now with quite a force, furnished by Mr. Holt, and in a general way we can state that the mines are developing most beautifully.

Lookout District.—Panamint *News*, Sept. 22: Archie McDonald came in from Lookout last Monday, and says that the Minnie-Etta mine, owned by Wm. M. Lent, J. J. Dolan and others, is developing splendidly. Four cuts have been run into the hill, exposing a vein from three to fourteen ft in width and carrying a large mass of ore, assaying from $300 to $500 per ton. The walls are well defined, and the ledge is dipping into the hill at an angle of forty-two to forty-five degrees. From present appearances there does not seem to be a doubt of the permanence of the vein. About the first of next month work will be commenced on the Keystone, owned by the same company. This mine has been examined by San Francisco experts who believe it will prove equally as good as the Minnie-Etta.

Surprise Mill.—The pulp assays at the Surprise mill from the 16th to the 20th of September, have been $85.81, $95 92, $76.96, $92.28, $97.17. And this with but little care in selecting the ore. By more careful selection the above figures can be increased at least fifty per cent. The fineness of the bullion is as follows: First bar, of 6,594.04 ounces, is 942 fine; the second bar, of 5,256.11 ounces, is 843 fine; the third bar, of 5,409 ounces, is 881 fine. Average fineness of the three bars, 888⅔. At least a ton of this bullion, worth about 28,000, will be shipped to San Francisco in four or five days. The mill is averaging about $1,200 per day.

KERN.

Silver-Bearing Lead.—*Courier*, Sept. 25 A silver-bearing ledge was discovered last winter, about seven miles from Kernville, which attracted considerable attention at the time, but from which nothing more has been heard till last week. The discoverers of the ledge, believing they possessed a valuable mine, set to work to develop it and find the true character of the deposit. In pursuance of this design they started a tunnel into the mountain at some distance below the mine. They had proceeded about 100 ft when they struck the lead, which proves to be well defined and growing larger as it descends. Assays made of the rock show a return of $700 to the ton in silver, with traces of gold. This is the first silver-bearing lead discovered in Kern county, but as the existence of rich silver ore has been demonstrated, we may expect to hear of more developments of a similar character.

MARIPOSA.

Rivka Tunnel.—Mariposa *Gazette*, Sept. 25: Since our last advice the River tunnel has advanced to 1,157 ft, with the same kind of rock as at the last writing, only a little harder. Water is still met with, but owing to the compact character of the ground it only makes the appearance when a perceptible fissure is cut.

As showing the tough nature of the ground in which the heading now is, we mention the fact that notwithstanding water is used in drilling, a circle of flame can be distinctly seen while holes are being started, and even when they are six inches deep.

The average weekly advance for the past eight weeks has been only 19¼ ft. During the past month over fifty drills, each 1¼ inches in diameter, have been broken close off near the machines, owing to the crystallization of the steel by the hammering to which it is subjected while in use. This is what one would call difficult ground, but as we learn harder rock is yet anticipated before the vein is reached, as it is a well known fact that the hanging wall of the Pine Tree mine is almost like cast iron in its resistance to the drill and powder. In all respects, so far, the rock in the River tunnel is like that of the Pine Tree.

NEVADA.

Goon Clean-up.—Grass Valley *Union*, Sept. 25: We have heretofore mentioned that a crushing of rock was being made from the Jennings location, the north extension of the Allison ranch lead. A clean-up of 45 loads of this rock was made at the Gold Hill custom mill, J. W. Crase, superintendent, on Thursday, and produced a beautiful bar of gold worth $6,000, or nearly $133.50 per load. This is a splendid result, and very encouraging to the owners, and will doubtless cause them to erect permanent machinery and open the mine systematically, as a lead that produces such quartz as that is entirely too valuable to be permitted to lie idle. Martin Ford, of Boston ravine, and Edward Commins, of San Francisco, are the principal owners in the location.

Items.—North San Juan *Times*, Sept. 25: The Bedrock claims, near Birchville, owned by V. G. Bell and others, are reported to be yielding good revenues to the owners. These mines are among the best on the Ridge, and employ a large number of hands to work them. Under the energetic management of Mr. Bell, no stone will be left unturned to make them pay.

A new shaft, over 100 ft deep, has been sunk on the upper end of the new tunnel, now being driven into the American company's claim at Sebastopol. At this depth, owing to the immense body of water which flows into the shaft, work this week was stopped. Before the company can proceed further it is supposed that a pump and other hoisting gear will have to be obtained.

The Yuba gold mining company, whose claims are located in the heart of Manzonita hill, between Sebastopol and Sweetland, are the owners of a large amount of valuable mining ground. It is said that negotiations are afoot between the company and certain parties for a purchase of the Yuba claims.

The Manzanita hill claims, situated on the lower or south end of Manzanita hill, near Sweetland, and owned by the Milton company, are reported to be paying good dividends. An immense body of gravel has been washed away since last spring. The company owns a large amount of gravel, and every foot of it will pay handsomely.

PLACER.

Another Gravel Mine.—Placer *Argus*, Sept. 25: A hasty survey of the works of the Auburn gravel mining company, shows that this new enterprise has been pushed with commendable vigor, and that a brilliant prospect is before them. After washing off a small knoll, with encouraging results, the company have extended their pipes about three-fourths of a mile further, and are now nearly ready to begin on a large and very rich deposit of gravel. They have been delayed considerably in getting their pipe, but it is now all on the ground, and by the middle of next week, the work of washing will begin. The tract of ground on which they operate has been thoroughly prospected, and is known to be very rich. The top gravel prospects thirty cents to the yard, while at the bedrock it pays from five to six dollars. As there are about sixty acres in this tract, the claim is at present rigged up, will furnish employment for a long time. The preparations for work are of a very complete character. The tail flumes have been extended further down the canon, and several new under-currents have been put in. Two giants have been placed in position, and will be at once connected with the main pipes. The new location gives about seventy-five feet more fall, and of course a greatly increased pressure. The bank of gravel to be worked varies from one hundred, to one hundred and seventy feet in depth, and can be worked very easily, as it contains no pipe clay and but few boulders. The development of these immense gravel beds, and the demonstration of their wealth, marks a new era in the business of Auburn. The success of this company being now assured, we may expect the large beds extending for miles above and below town, to be washed out, and contribute their wealth to the enrichment of the State. The Auburn company own about two hundred acres of good mining ground, and valuable banks of gravel extend along the American river as far as Penryn. The great advantages possessed by these mines over those higher in the mountains, add greatly to their value. There is never any snow to interfere with working, and there is an abundance of water the year round, enabling owners to work all the time, instead of only a few months in the year.

SAN BENITO.

The Consolidated Wonder.—Hollister *Enterprise*, Sept. 25: The above mine, or combination of mines, situated near Hollister, the property of Messrs. Stayton, Shockelford, Crepin and others, is exciting considerable attention. From the statements made by those who have visited it lately, the developments, so far as progress has been made in the work seem to be of an unusual promising character. Large quantities of ore have already been unearthed, and the samples which have been exhibited here, are certainly far above the average productions of a new and partially developed mine. As I am an old miner, I can give you the facts not as a looker-on, but as an operator. I dug out the rock with my own hands and submitted it to a test, and I will not hesitate to say that it is one of the best quicksilver discoveries in the State, as the following test will show: I reduced four ounces of the rock taken out four feet below the surface, and I received one ounce and forty grains of fine quicksilver as the fruit of my labor. There are many lodes running parallel to each other in the above claim, and I would not exaggerate if I should say that there are millions of tons of rock and dust that will pay from five to ten per cent. lying close at hand.

SAN LUIS OBISPO.

San Jose Quicksilver Mine.—*Tribune*, Sept. 25: Nine miles, in an air line from San Luis Obispo, nearly due east, at the head of the Rinconada, are a group of mining locations, commonly called the San Jose mine. The whole mountain is one immense outcrop of metamorphic sandstone, which forms the matrix for the ore. Upon the northern side of the mountain the mine has been worked to a great extent as an open quarry, and the ore lies in huge piles and reefs, for future reduction. Into this side of the mountain from the level of the grade of the quarry, a prospecting drift is being run under the heart of the mountain. The indications are flattering for an immense body of ore, several stratums having already been cut. Below this point the Ivanhoe tunnel is being pushed under the crest of the outcrop to the main workings, and at that date only lacked 30 ft of reaching the objective point for which it is being run. It will open the mine to a depth considerably over 100 ft below the lowest workings of the lowest level. The present supply of ore is being mined from the easterly side of the mine, where there are numerous tunnels, drifts, shafts and stopes, all of which show more or less ore. There are numerous evidences of a rich mine where opened to any considerable depth. The entire outcrop, which is several hundred ft in width, is more or less permeated with cinnabar, portions of it being rich.

SANTA BARBARA.

The Los Prietos.—Santa Barbara *Press*, Sept. 22: This morning Mr. Mahon, Supt. of the Los Prietos mining company, informed a *Press* reporter that his mines are going on with every promise of a brilliant success. There are in all six drives, from five of which about 1000 tons of ore will be ready for reduction about the 1st of Nov. next, and 25 men are at present employed upon the mine. A new drive is being pushed on to meet a shaft 120 feet deep; the drive passes below several of the croppings, and is expected to strike the ore in considerable quantity. The croppings extend over an area of 6 miles, and are of the finest ore in California. Since July 1st no assay has been made, but prior to that date gave a result of from one-half of one per cent to thirty-five per cent., and some even higher. The present drive is about 900 ft from the base of the hill, and it is proposed in all to have about 8 drives to the shaft at distances of about 100 ft apart. Since Mr. Mahon has been in charge of the mine no machinery has been bought, no expenses being incurred beyond those absolutely necessary to carry on the work. The winter supplies are being laid in, for when the river rises the mine is shut off from communication with the outside world except by means of a rough mountain trail, across which everything has to be brought by pack mules. The wealth and size of a successful quicksilver mine, when properly worked, is almost incredible. One at Almaden in Spain is 1700 ft deep and has been worked with a profit for 2900 years.

SONOMA.

Mining Items.—*Russian River Flag*, Sept. 23: The Board of Directors of the Great Eastern quicksilver mining company met in Healdsburg yesterday and declared a dividend of 3 cents a share, aggregating $1,800, payable immediately. This is the result of a 6 weeks' run with 5 retorts—after reserving $888 for expenses, etc. As the company receives from the lessees only one-fourth of the product of the mine, the entire net value of quicksilver produced in that time must have been, at the late low prices, about $11,000.

E. G. Hall informs us that the new furnace for the Mt. Jackson mine, near Guerneville, was completed last Tuesday and was heated up the same day. It will be charged with ore this week. Everything about the furnace seems satisfactory.

In the Calistoga silver mine they have struck a rich very ledge, better than they have ever worked before, and they have a large force of men at work getting out ore. They have struck another ledge half way up the mountain side that assays $480 gold. This ledge is a very large one, and the further they go in the wider it gets.

SIERRA.

Another Mill.—*Mountain Messenger*, Sept. 8: Jesse Corney is making preparations for building a five-stamp quartz mill at his ledge, in Jim Crow canon, the castings to be furnished by Manson & Co. Jesse has worked hard for years prospecting his ledge, and we earnestly hope that very soon his perseverance and energy will be rewarded with a golden harvest.

Alleghany.—Fessler and Lewis are taking out pay from Spohn's quartz ledge. Bay State and Highland & Masonic companies are doing well. Kenrelbach & Eastman found a pocket, recently, and extracted a couple hundred dollars in a day or two. Barrett & Childs, the past three weeks, have taken out from Kanaka creek, three nuggets weighing, 4½, 13 and 37½ ounces. These are encouraging statistics.

Minnesota.—Keystone company are driving a prospecting tunnel, and expect to strike pay soon. Out-buildings in good order. Minnesota company, S. and B. Ireland, owners, are preparing for winter, and are getting out timbers. Plenty of good quartz in sight. Sam generously allowed us to pack off a pocket full of rock. They are now building a blacksmith shop. The ledge is three feet thick and prospects well.

Excelsior Manufactory—A New San Francisco Industry.

For many years, and until quite recently, large quantities of a material known as "Excelsior" has been imported to this city from the East, withdrawing from the coffers of this State a large sum of money annually; and this, too, while we possess at home all the facilities, and a superior kind of wood for manufacturing the materials at our own doors. It seems to have been left for Messrs. J. S. Spaulding & Co., the enterprising machine carpet beaters, at 353 and 355 Tehama street, to observe and comprehend the opportunity which was here presented for the establishment of a new and useful industry in San Francisco, and we are pleased to say that their effort has been a most successful one.

"Excelsior," as most of our readers know, is a peculiar, thread-like wood shaving, used for filling mattresses, and is intended mainly as a substitute for pulu, it being more convenient, more conducive to health, and much more cleanly and free from dust. It also wears longer, and is more elastic. The Excelsior factory is in the same building with the Pioneer carpet beater, and belongs to the same parties. It is understood that the facilities of the establishment shall keep pace with the demand for the article, which is already so great that the proprietors contemplate an early increase to their present machinery.

The wood employed here for the manufacture is that of the cottonwood tree, which is found to be much superior to the poplar generally used at the East. It is of stronger fibre, and less liable to pack, and break up, and is lighter, in the proportion of 19 to 22. Hence, the same weight and cost gives more bulk, the thing sought for. The wood is obtained from Humboldt county, as that grows there is found to be of the best quality to be found in the State.

In order to save freight it is necessary to pack the excelsior from the East into close packages, in which condition it remains a long time, during the Cape Horn transit and delay in the warehouse at both ends of the route. This close packing not only results in a material deterioration of the fibre, but also necessitates much labor in picking it loose before it can be used, while that manufactured in this city is very loosely packed, being put up in boxes like hay, and only packed close enough for convenience in handling. Care is also taken here to effect a very thorough separation of the dust from the fibre, much of which is necessarily produced in the process of manufacture, and which the Eastern manufacturers usually bale up without separation—thus deteriorating the entire mass, and compelling the purchaser to pay for that which is not only of no use to him but which he must get rid of at the cost of his own labor. Dealers and others who employ this article in their manufactures will find it to their advantage to purchase the home made article, and, moreover, in doing so they will encourage home industry and aid in keeping our money at home, to help our mechanics and furnish an increased market for the produce of our farmers.

Stanley has been heard from. He has buried two of his companions who have died of malarial fever, and lost twenty-one of his followers in a fight with hostile natives. He has made a survey of the lake Victoria Nyanza.

The California Watch Company.

There is, perhaps, no one point of interest at the Mechanics' Institute Fair that is more attractive to the general public, than the stand in the gallery occupied by the Cornell watch company. Here may be found every evening groups of interested and curious spectators initiating themselves, by ocular practice, into the mysteries of watch making.

Within the railing surrounding the exhibit, watchmakers are at work with the different parts of the skilled mechanism which goes to form the machinery of a pocket time piece. A casual glance will fail to convey to the ordinary observer the intricate and delicate character of the class of workmanship which is necessary to produce a perfect watch. Only by a visit to the factory itself, and a careful and appreciative examination, can the difficulty of watch-making be understood. Let the reader think of machinery and tools which are used to drill holes one eighteen-thousandth of an inch in diameter! Think of screws so minute that 190,000 of them are contained in a pound troy! and these Lilliputian portions of the body mechanical of the watch have to be made with a precision which approaches to perfection—the devintion of the hundredth part of the width of a hair would be fatal to the time-keeping qualities of the watch. An excellent idea in general can be obtained by examining the artisan at work, in the Pavilion stand, as to the importance of nicety and precision of detail necessary in watchmaking.

The Cornell watch company was organized with the following officers: Paul Cornell, president; Oliver Eldridge, vice-president; Bank of California, treasurer; H. Cox D. D., secretary; Charles R. Bacon, superintendent. Directors, John Parrott, Peter Donahue, William Norris, Paul Cornell and Oliver Eldridge.

A building was erected on Fourth St., and the manufacture of watches inaugurated last spring. The company had employed the best and most skilled watchmakers obtainable, and soon obtained a foothold in the market, their goods meeting with a welcome reception from dealers generally. It was soon found, however, that the premises were not, in all respects, suited to the business. Although built especially for them, there were some objections to the location, and it seems that the flying dust, which is almost ubiquitous in San Francisco three-fourths of the year, threatened to have an injurious effect in the manufacture of their watches. A meeting of the directors was called, and it was decided to increase the capital stock, re-organize the company, and remove the manufactory to Berkeley.

The re-organization was accomplished a few days since. The capital stock was raised from $300,000 to $700,000, and the name of the company has changed to the "California Watch Company." The new officers are as follows: President, N. W. Spaulding; Vice-President, Irving M. Scott; Secretary, H. T. Graves; Treasurer, Oliver Eldridge; Superintendent, Charles R. Bacon; Assistant Superintendent, J. K. Bigelow. Directors: N. W. Spaulding, Irving M. Scott, Peter Donahue, Oliver Eldridge, Paul Cornell, A. Remmelsberg. Arrangements were at once made with the Berkeley Land Association, by which the watch company are to obtain a most desirable tract of land on this property, directly on the line of the C. P. R. R., which is now in the course of construction, and will form the direct line overland. They will, next week commence the construction of a watch factory. It will be 150 feet in length and three stories high, except a portion in the center, which will be four stories. A parallel court extending back twenty feet is to connect with a building for the engine and repairing shops. The building will be pushed to rapid completion and the prospect for the future of the California watch company is extremely hopeful. Two hundred persons will be employed and the increased facilities will be taken advantage of to introduce many novelties in watches. One style of watch will be made, the works of which alone will cost $250 each. Houses will be erected in the neighborhood and disposed of at cost price to the employees on the installment plan. We are glad to note that the energy and skillful management which has marked the business career of Mr. Bacon is appreciated by the new company. He will be continued as superintendent. We shall take occasion to refer to the progress of this new enterprise again.

Triple Cylinder Engine.—The Alden triple cylinder is something new. Two cylinders alternately exhaust into an auxiliary while their pistons are balanced by the free exhaust steam around them. Its results are also new; viz., it will use all the exhaust steam, does away with all back pressure and secures regular motion. This virtually doubles the power of steam over the common single cylinder steam engine, or saves half the steam or half the fuel. *American Manufacturer.*

To Cleanse Kerosene Casks.—Set the cask on its end; remove one head, and build a fire in the bottom of the cask with straw or any light combustible matter. Allow the head which has been taken out to remain suspended in the cask while burning. When the inner surface is charred, put out the fire by covering up the open end, and rinse the barrel with strong lye. A barrel thus treated can be used for cider, meat, or any other purpose.

Completion of the Hell Gate Excavations.

On July 4th, 1876, the great explosion which is to shatter the submarine rocks at Hallett's point, and open a navigable channel for vessels of large draft, coming and going through Long Island sound, to and from New York city, will take place; such, at least, we understand to be the present intention of those in charge of the work. The excavations were completed about two months ago, and the operation now in progress consists in the boring of the holes in which the heavy charges of nitro-glycerine are to be placed. These borings are about half finished, and will require the labor of two or three months longer, after which two months more will be occupied in inserting the charges.

The entire surface undermined measures 2½ acres, and the cuttings aggregate 7,042 feet, varying in hight from 8 to 22 feet, and in width from 12 to 13 feet. There is a roof ten feet thick between the mine and the water, and the latter, at the outer edge of the excavation, is 26 feet deep at low tide. Between the headings and galleries heavy piers are left, which now sustain the immense weight of rock and water above. In each pier from ten to fifteen two and three inch holes are being drilled, and in the roof similar apertures are being made at intervals of five feet apart. All of these openings will be filled with nitro-glycerine, in charges of eight and ten pounds, and all will be connected together by gas pipe filled with the same explosive. This will be done during the cold weather, when the danger of hauling the nitro-glycerine is greatly diminished.

Previous to the explosion the coffer dam will be broken away and the water allowed to fill the entire excavation, so that it will serve as a tamping. Then, by means of an electric fuse, the nitro-glycerine in the gas pipe will be fired, which will determine the blowing up of the whole affair. No fear is apprehended as to the result, since it has been determined that the explosion of half the charges will be sufficient to cave in the roof, and cause it to fall to the sunken floor, deepening the water at once to a proper depth, or necessitating but little dredging to complete the work.

The new operations at Flood rock will involve still greater cuttings than at Hallett's point. The shaft is now down to a depth of fifty feet. The Hallett's point work has been under way since 1869, but has been greatly delayed by the failure of Congress to provide sufficient appropriations; if the same course is to be followed with reference to the Flood rock excavations, it will be manifestly impossible to form any estimate of their time of completion —*Scientific American.*

American Agriculture.

An American pamphlet by Mr. S. B. Ruggles recently published, calls attention to the increase of production in the United States. According to the census the population in 1840 was 17,069,453, but in 1870 it has increased to 38,558,371. The growth of production was in some things more rapid even than the growth of population. Thus, the wheat grown in the earlier year amounted to 84,811 175 bushels; but in 1870 it was returned at 287,745 026 bushels. Butter and cheese increased from 202 410,440 pounds in the one year to 677,017,095 pounds in the other, and the yield of hay was nearly trebled. The system of returns made thirty years ago was not as complete as it afterwards became, and therefore the details at that period are in many respects deficient; but if we take the year 1850 as a starting point, we have more grounds upon which a comparison can be made.

About 6,000,000 had been added to the population at this time. The cash value of farms, including farming implements, machinery, and live stock, in 1850, was estimated at $3,967,343 580; but in 1870 this had increased in a most remarkable manner, and it was then calculated at $11,124,958,747. The production of hay doubled; the value of animals slaughtered or sold for slaughter increased from $111,703,142 to $398 956,377; the yield of tobacco grew from 199,752,655 to 262,835,341 pounds; of wheat, from 100,468,574 to 287,745,626 bushels. It was only when we came to the special productions of the South that this increase ceases. Unfortunately, the difference then in some instances becomes a diminution. The yield of cotton was more than maintained. In 1850 it amounted to 2,469,093 bales of 400 pounds each; in 1870 it reached 3,011 996 bales. But the rice crop fell from 215 313,487 pounds to 73,635 021 pounds; and that of sugar from 267.577 to 87,943 hogsheads.

In contrast to this the report from manufacturing States is noteworthy, the value of the products of manufactures having increased from $1,019,106,616 to $4,232,325,493. The total yield of cereals in 1870 was 1 387,274,217 bushels, of which the Southern Atlantic States, from Maryland to Florida, and the interior States south of the Ohio and on the Gulf of Mexico, produced only 320,730,258. New England, the Middle Atlantic States, and the States north of the Ohio produced 1,028,341,574 bushels, and the Pacific States and territories only 38,202,385. The farms of the New England States are valued at $707 912 439, in the Middle Atlantic States at $3,028,551,359, and in the States north of the Ohio at $5 132 816,399 In the South Western States the valuation, too, is as high as $1,254,614,196. In1870 the agricultural population amounted to 5,922,471 persons, of whom 5,303,363 were returned as natives of the United States. Of the rest the Germans are the most numerous, and the Irish the next. The total value of the farms being $11,124,958,747, we have an average per head of $1,878, while the net yearly product of $2,137,252,383. gives an average in like manner of $360.—*London Farmer.*

How the Rust Grows.

The transformations in the growth of a butterfly are so evident that the merest school boy may try the experiment and observe the truth of it for himself; but in the rust the objects are so very small that the changes can only be seen by the keen eyes of the skilled observers aided by the best powers of the microscope. Beginning with the spores of the mature rust-plant, as seen in the black stains on the old stubble of any grain field, it will be found that when the warm and moist days of spring come these spores germinate, producing in a few days a short stem bearing a crop of other spores of very much smaller size. To avoid confusion, these must be called by their scientific name, *sporidia*, while the parent spores are the *teleutospores*. The sporidia have never been seen or made to grow up on the grain; but when they find their way to the leaves of a barberry bush, they soon begin to germinate, and make themselves manifest on the under surface of the leaves in what are commonly known as "cluster cups." The interior of these pretty little cups is closely packed with spores of a still different kind, styled the æcidium spores. These will not grow upon the barberry, but when they fall upon a blade or stalk of grain, they soon produce the yellow rusty covering so often seen as the grain is beginning to ripen, and caused by a multitude of *uredo* spores. Later in the season this uredo state produces the final, perfect teleutospore, thus completing the circuit of life in this little rust-plant. Long before this rust was discovered to be a plant, farmers had noticed that there was a close relation between it and the barberry, and at present the latter is being rapidly destroyed with good results, though it can scarcely be expected that the rust-plant will thereby become extinct, as probably the æcidium state grows on other than the barberry, though not yet discovered elsewhere. This is an excellent illustration of polymorphism, so common among fungi, and it also answers well to show the vast number of spores these microscopic plants produce. The teleutospore usually bears from five to ten sporidia, and allowing that only one of these finds the barberry leaf, there may be from one to fifty cluster cups as the result. In our case suppose only *one*, and a low estimate for its contents would be 250,000 æcidium spores; and if only one in a thousand finds a place on the grain stalk, and each brings forth its 250,000 fold, there would be under such circumstances 62,500,000 spores from the single one with which we started. Taking the same teleutospore, and supposing every spore in all the stages found its place to fill it, the result would be 1,562,500,000,000,000,000 spores, which may be looked upon as its true descendants for the season. On giving each inhabitant of the globe his equal share of these reproductive bodies, he would have nearly as many as there are individuals in the whole human race. This may seem like a very large story about a very small matter, but it is not the only strange truth the microscope has revealed.—*Scribner for October*

Size in the Eye.—Size with the eye, as with the brain, is generally conceded to be a measure of capacity. A large eye has a larger range of vision, as it unquestionably has of expression, than a small one. A large eye will take in more at a glance, though perhaps with less attention to detail, than a small one. Generally speaking, large eyes see things in general, and small eyes things in particular. The one sees many things as a whole, considering them in a philosophical or speculative way, often seeing through and beyond them; the other sees fewer things, but usually looks keenly into them, and is appreciative of detail. Some eyes, however, look at everything and yet see nothing. Fullness of the eye, causing a bulging of the lower eyelids, is the well known sign of Language. Persons with this sign large have not only a speaking eye, but also a speaking tongue; whereof their fellows do not long remain in ignorance. A general projection or fullness of the eye above and below, which brings the eyeball forward on a line with the face and eyebrow, denotes the quality of physical perception, or the capacity to see quickly whatever appears upon the surface of things. A person with such an eye, on entering a room for the first time, would note rapidly the shape, size, arrangement, and general appearance of the different articles of furniture in it, the color of the walls, curtains etc.; take in with equal facility, the color of eyes and hair, size and appearance of any person who might be present. In looking at a picture such a person would at once incline to examine the details of color, number, grouping, attitude, and costume of the figures composing it.—*Annual of Phrenology.*

A patent has been taken out for correcting the injury which befalls steel to be welded to iron in consequence of the great heat of the latter. The process is to wet the steel surface to be welded, then sprinkle it with a powder composed of calcined borax, iron filings and prussiate of potash. The two surfaces are then brought in contact and raized in about 600° of 700° Fah. When subsequently rolled or hammered, the joint is found complete and the steel intact.

Celluloid.

A destructive fire, attended by an explosion, recently occurred at the celluloid works, Newark, New Jersey. One life was lost, several persons injured, and property to the extent of $150,000 destroyed. It is alleged that, when the fire was discovered, the engineer immediately turned on steam into the apartment, when an explosion instantly ensued, the inference being that the steam assisted the explosion. But this we think, is a mistaken inference.

Celluloid is a manufacturer's name given to a species of collodion, or dissolved and dried gun cotton. Common cotton, the refuse of cotton mills, and other vegetable fiber is dipped in a liquid composed of nitric acid and sulphuric acid; then drained, washed in water, and dried, when it is found to possess highly inflammable and explosive qualities, and is termed gun cotton, as it may be used as substitute for gunpowder; it has twice the power of the latter. This prepared cotton may be dissolved in ether and alcohol, when it forms a thick transparent liquid, known as collodion. This is the material used by photographers, who, in taking a portrait, spread a thin film of collodion liquid on a glass plate. The ether and alcohol soon evaporate, leaving the dissolved cotton to dry upon the glass in the form of a thin membrane or skin, which receives the silver compounds used in taking photo pictures. Collodion, when dried in any considerable mass, forms a tenacious, transparent substance, somewhat resembling horn. If whiting, zinc oxide, and other coloring substances are added to it while in the liquid state, and then dried, substances resembling ivory, hard rubber, bone, etc., result. All such forms are, very inflammable.

The use of alcohol and ether is expensive as a solvent, and the celluloid makers substitute camphor, the use of which forms the basis of their patent. By peculiar manipulation, involving the combined employment of heat and pressure, they are enabled to produce plates and blocks of dried collidion, of beautiful texture and color, possessing a certain degree of elasticity, with great strength and toughness, and little weight. From these plates and blocks a great variety of merchantable articles are made, such as harness trimmings, jewelry, dental plates for artificial teeth, billiard balls, knife handles, etc. They are a complete substitute for hard rubber and ivory for many many purposes, and considerably cheaper.

But not only is the manufacture of the crude celluloid dangerous, but even the most finished articles made from it will readily inflame. As a practical experiment, any one may take a strong and highly polished martingale ring of celluloid, which the strength of a horse could hardly break; apply to its surface a lighted match, and it will quickly ignite like a torch.

Celluloid factories must be classed among the extra hazardous risks, so far as fire insurance is concerned, and their presence in large cities are not desirable. The manufactories should be isolated; the finished goods should only be stored or exposed in small quantities in the shops.

Development of the Iron Trade.—The first discovery of iron was on the mountain Ida, in Croto, about 1500 B. C. The famous Delhi wrought iron pillar, forty-eight feet long and weighing over seventeen tons, was erected A. D. 319. Ralph Hogge produced the first pig metal in England in 1543. He used charcoal as fuel. In 1619 David Dudley succeeded in making cast iron, using pit coal from the forest of Dean as fuel. In 1735 Abraham Darley made the first cast iron from coke, at his works at Colebrook Dale, England. Henry Cort built the first sand bottom puddling furnace in 1783, in his works in Gosport, England. In 1781 Henry Cort invented the grooved rolls of the present day. In 1816 Samuel Rodgers invented and introduced the iron bottom puddling furnace. In 1826 Messrs. White & Hazard attempted to make pig metal with anthracite coal, but failed—the furnace chilled. In 1831 Neilson invented the hot blast. In 1833 David Thomas conceived the idea of using anthracite with the hot blast, and in 1836 he made anthracite metal a success. In 1838 Mr. Thomas came to this country, and made the first anthracite pig metal in the United States, at the Pioneer furnace, at Pottsville, Pa., in June, 1839. In 1847 Henry Burden introduced his rotary squeezer into the works of Lyon, Shorb & Co., at Pittsburg. In 1856 Henry Bessemer took out his patent for Bessemer steel.

The California Wine Crop.—The wine crop of this State increases each year in importance. We have gathered from different sources statistics which afford sufficient data to base a calculation as to the probable product of this year's vintage. The production of the State this year will be at least 8,000,000 gallons, divided about as follows: Sonoma, 1,000 000; Los Angeles, 800,000; Solano, nearly 500,000; Napa, 700,000; El Dorado, 600,000; Yolo, 500,000; Anburn, 400 000; Yuba, Sacramento and Marysville, 1 200,000; Colusa, 300,000; Santa Clara, 500,000; Santa Barbara, Ventura, San Bernardino, San Luis Obispo, Monterey, Tehama, Lake and other counties not enumerated, say 1,500,000, making the total above given. Sonoma is the largest wine producing county in the State, having last year for the first time exceeded the product of Los Angeles. In the next few years a large number of vines will come into bearing, increasing the present production almost one-half. The vintage here promises well. It will commence in a few days, and is two weeks sooner than last year.—*Sonoma Democrat.*

Useful Information.

Freezing Water in Bottles.

Visitors to Paris are well acqueinted with the glaes bottlee containing water frozen into solid blocke which are delivered every morning by *La Societe des Carafons Frappes* to its customers; and the country cousin wonders indefinitely as to how the block of ice is put into the bottle. A new method of cougeling such bottlea of water hss recently been introduced by M. Carre, an inventor whoee success in the introduction of freezing machinery is well kuown.

Freezing water in a vscuum is a common lecture room experiment, eud it is readily done by placing water in e saucer under the bell glass of an air pump, and exhaustiug the air; when the ebullition caused by the withdrawal of the aeroetatic pressnre ceases, congelation begins. It is not difficult to understand the sequence. In pessing from a liquid to a vsporous condition, without the aid of heat from outside, the water must borrow some hest from surrounding objects; and this heat pessing off in vspor, the remaining water quickly becomes frozen. M. Cerre has ntilized thia process in a very ingenious manner, and has reduced it to a very simple and economical method, capahle of domestic nse.

The bottle is suspended, by means of a rubber cork, from the uozzle of a pipe, and the withdrawal of the air, by working a hend lever, iuducea a spsedy commencement of ebnllition. The rising vapor is drawn through an intermediate vessel filled with sulphnric acid, which at once absorbs end condenees it, and congelation commences in the middle of the wster in the bottle; and from the first formed particles, needles of ice soon radiate in every direction Their nnmber angments in geometrical progression, and their eize increases as you behold them, until, in less than one minute from the commencement of the operation, a bottle of water is frozeu eolid with very little exertion.

This seema to be a handy apparetus for use in places where ice is not readily obtainahle. Ice is now being made and sold in London for $2.50 per ton; and if a more simple method of doing this can be introduced, so that the indispenssble commodity may be made in every grocery or honsehold, the storing companies, with their huge monopoly, cumbrous csrts, and high cherges may soon be gone from among us.

A German Invention.—It is stated that a recent German improvement in decorative art consists in the fusion of gold, silver and platinnm with bronze, by which the most gorgeous effects sre produced — gold fusion giving a splendid violet tint, silver a faintly lustrous "Kioto" tone, and platinum a rich and deep black shade. The intermediate tints may be obtained by modification of heat, while the seme process may be applied with nearly equel success in the case of cast iron. Very novel effects in this art have been prodnced by lsying one tone upon the other—as, for instance, colored leaves end variegated arabesques on diffsrently tinted metallic surfaces—and the method is beginning to be extended to the ornamentation of leather, thns bidding fair to revive, at a moderate cost, the art of preparing leether mosaics, one of the most elegant of the various adaptations of inexpensive materials to artistic purposes.

A New Cement.—A French chemist has succeeded in prepering e mineral compound, which is said to be superior to hydranlic lime for nniting stone and reeisting the ection of water. It becomes as hard es stone, is unchangeable by air, and is proof againet the action of acids. It is made by mixiug together ninetesn pounds of sulphur and 42 of pulverizsd stoneware and glass; this mixtnre is exposed to a gentle heat, which melts the snlphur, and then the mass is stirred nntil it becomes thronghly homogenous, when it is run into molds and allowed to cool. It melts at abont 248° Fahr., and mey be reemployed without loss of any of its qnalities whenever it is desirable to change the form of an apparatus, by melting it in a gentle heat, and operating es with asphalt. At 230° Fahr., it becomes a stone and preserves its solidity in boiling water.

Driving Screws into Hard Wood.—A correspondent of an English jonrnal writes: Hsving lately had occesion to screw together two pieces of ebony, I made nse of the following dodge, which was perfectly successful. I filed a flet about a quarter of sn inch long on the side of a commou wood-screw, commencing at the point. This out the wood, and formed a thread in the same wey that a tap would have done. The screw followowed it np and held well. Having previously had difficulty in getting screws to hold in box and other woods, I send the above wrinkle for the benefit of my brother amateurs.

Composition of Metaline.—Metaline is out at last. The following is officially given as the ohemicsl oomposition of this remsrkable new lubricant: Paraffine, 4.98; csrbon, 18.89; silica, 6.44; lime, 3.96; magnesia, 1.99; ferric oxide, 3.94; alumina, 2.53; leed, 32.40; ziuc, 20.07; copper, 2.75; tiu, 1.55; moisture, 0.51—total, 100.01.

Hard Pressed Tea.—Tea is now consolidsted into cakes by powerful hydraulic presses, in which form it is said to retain its flavor better, and consequently to be more economical, than in the ordinary loose condition.

Ammonia Paper Board.—This method of msnufactnring paper board, to make that article more generally useful and dnrable, is described as follows: When a sheet of paper is immersed in an ammonical eolntion uf copper, and then dried, it is said to be qnite impregnable to water and does not lose this quality even though the water be boiling. Two sheets of paper thns prepared, and psssed through a cylinder adhere to each other so completely as to be qnite inseparable. If a large number of sheets so prepared be cylindered together, boards of great thickness are obteined, the resistsnce and cohesion of which may be increased by interposing fibrous matter or clothes. The substance so prepared is quite as hard as the closest grained wood of the seme thickness. The smmonical solution of copper is prepered by treating plates of copper with ammouia of the density of 0.88 in contact with the atmosphere.

The cultivation of mehogeny in Jamaica has commenced. Other valuable woods for furnitnre hsve also been planted. Jemsica formerly produced mshogany much more highly prized thsn thet from Hondurss, the country being hilly, end the trees growing on hilleides hsving a harder textnre and richer grain thau those growing upon the level country of Honduras. It is stated upon good authority that one thousand ponnds sterling hes frequently been paid for a log of Jamsica mshogany. This seems a very extravagent price, mahogany being at the preesut time not so much in demand for furnitnre as formerly—but its intrinsic beauty end its strength ere sure to hring this wood again into fashion.

A remarkable phenomenon was observed in Brighton, Vt., Monday ahout noon The sun was surrounded by a distinct circular rainbow (so to ssll it) of a radius abont one third of the altitnde of the snn. There wae another of double the radius, of which the lower part was very distinct and beautiful. In addition to these there was a third circle of white light of equal radius with the smaller; hut, instead of its center being in the sun, the circumference passed through it, the opposite point being to the north. The smsller prismatic circle lasted about en hour, becomiug finally white. The other two were of shorter duratiou.

New Balloon Experiments.—A balloon ascent to escertein the possibility of a precise aim with projectiles from a great hight has been msde by M. Eugene Godsrd at Rheims. M. Godsrd and two officers floated at a hight of abont 3,600 feet, and were perfectly successful in hitting any prominent given object, such as a road, a cansl, etc., with atones and empty bottles. At his next asceusion M. Godsrd inteuds to try and kill some of the numerous hares seen throngh his glass on the plains below. If these experiments prove successful, balloons may become highly nseful for sporting.

A Proper Precaution.—Many people are nervous for fear tometoes and other acid fruits will become poisoned by the leed in the tin cans. A formula has been prepared, and dealers are putting it upon their cans, for detecting the poison if there is any.

Good Health.

Fever and Ague.

It is more prevalent dnring the spring and fall thsn at other seasons; the reason is, that changes of temperature are the more sudden and frequent. There are persons who have hved many years in fever end ague districts without having had the disease. With proper cere and attention all might avoid it. An observance of these simple rules would generally ward off the disease.

Avoid exposure to the damp air of the early morning and the eerly eveniug, except when exercising, and then do not remain in the opeu air to cool off. Avoid great fatigue; sleep eight hours out of twenty-four. Bs sure that the water used for drinking and cooking is perfectly pnre. Wear flaonel underclothing at all seasons. Keep the feet warm and dry.

To cnre the fever and ague, take twelve greins of qninine at oue dose, abont an hour before the chill is expected. Just one week from that hour take another twelve grains of qninine. The disease will seldom return. This is the dose for an adult. Children should take smaller doses according to age. The reeson that decided doses cure fever and ague seems to be, that the disease receives a shock which breeks it. Small doses of quinine only hold it in check dnring the time the medicine is beiug regularly taken; as eoon as it is snspended the disease generally returns. Hence the populer notion that quinine only feeds the disease. The fault is not with the medicine, bnt in the manner of administering it. While we do not believe in encourssging the employment of medicine, we are bound to say that quinine, heroically administered, has proved the only dead shot for fever and ague in our practice.—*Hall's Journal of Health.*

Sick Headache.—Two teaspoonfnls of finely powdered charcoal, drank in a half-tnmbler of water, will often give relief to the sick headache when caussd, as in most cases it is, by a superabundence of acid on the stomech.

Hygieia—The Goddess of Health.

The following ettractive portrsiture of the goddess of health ie from the introductlen to the Report on Hygiene read by Dr. Benj. Lee, of Philadelphie, at the recent annuel meetiug of the Medical Society of the State of Pennsylvania:

Hygieia, the "sweet, smiling goddess of health," was one of the fairest conceptions of an age which combined, in an exceptionel degree, poetry of thought with clearness of judgment, owing, perhaps, to the very fact that it appreciated so much more thoroughly thsn any other (unless it may heve been the Mosaic) the absolute necessity of coporeal sanity to the existence of meutal sanity, and wss, therefore, not ashemed of this humen form, which the Creator himself, having moulded efter his own likeuees, contemplated with unmixed admiration, and pronounced superlatively "good." This age of poets, sages, and artists lavished ell its wonderful powers of creative geuius in giving expressiou to its ideal of that divinity whoee special care should be the bestowment and maintenauce of physical health. The embodiment must needs he feminine, because the mother, the nnrse, the wife, have for their special function that daily miuistry to the bodily welfara and necessities of offspring and of husband, that constant presence in and care of the home, which are the two essentials of health in the family and in the individual. She must needs be youthful, as presenting ever to the mind of the entranced beholder that period of life when a blood unvitiated by vice or excess courses through a frame unmarred by violence or exposure, and colors a cheek unstained by sin. Purity must look forth from her eyes, and truth sit enthroned ou her hrow; for unbridled passiou and soul-torturing deceit ere equally inimicel to the perfect preservatiou of health. Her form must he lithe, vigorous, and well uourished, but not redundaut, as showing her adorers thet neither asceticism on one haud, nor gluttony and voluptuousuess on the other, are allowed in her worship, encouraging sctivity as contrasted with indolence. Cheerfuluess must rediate from every feature, since gloom end despondency are the recognized foes of senity, whether of body or miud; and over ell, pervading expression of face and pose of limb, must be thet indescribeble charm of geutleness, as teaching her votaries that in the mutual interchauge of kindly sentimeut end act they shonld greatly promote the commou health and common weel. And so has the lovely inspiration come down to us, immortalized by the sculptor's art, a joyous msiden, full of tender grace, robed in chaste end flowing vestment.

Cured by Laughter.—The Pittsburg *Gazette* relatss the following: "A short time siuce, two individuals were lying iu one room very sick, one with brain fever and the other with an aggravated case of the mumps. They were so low that watchers were needed every night, and it was thought doubtful if the one sick of fever would recover. A gentleman was engaged to watch over night, his duty being to wake the nurse wheuever it became necessary to edminister medicine. In the course of the night both watcher eud the nurse fell asleep. The mau with the mumps lay wetching the clock, and saw that it was time to give the fever petient his portion. He was unable to speak aloud or to move any portion of his body except his arms, hut seizing a pillow, he managed to strike the watcher in the face with it. Thus snddenly awakened, the watcher sprang from his seet, falling to the floor, aud awakened botb the nurse and the fever patient. The incident struck the sick meu as very ridiculous, and they laughed heartily at it for some fifteen or twenty minutes. When the doctor came in the morning he found his patieuts vastly improved, and he had never knowu so sudden e turn for the better, and now both are up end well."

What Every Wife Ought to Know.—Every action and emotion depletes the physical system. Milk, the first food absorbed by men and animals, is the only netural mixture, containing all the elements of blood save the coloring. Water constitutes three-fourths of the body. To work well, either physically of meutally, we must be fed judiciously end thoroughly. The worker must eat mixed food. Food properly administered stimnlates the system es wiue does, only more natnrally. The long night hours empty the stomach, deplete the system, and chill the body. On arising the physical condition is low, and should be recruited. If we lose time at early morning in bringing the body np to its natnral heet and strength, we cannot regain it dnring the day. A healthy man reqnires abont one pound of nntriment per day to keep him in good condition. While a working man wonld need daily five pounds of solid mixed food, two and a half would be enough for persons who lounge and sleep much.

A Fourth Set of Teeth.—It is stated that a woman ninety years old, et the Hospital of of Incurables, in Paris, has "cut" a complete fourth set of teeth; the third eet having appeared at the ege of sixty-three, end the eecond at forty-seven.

Domestic Economy.

Imperfect Cookery.

To ascertaiu just how much really good material is spoiled in the cooking would form an iuteresting and qnite fruitful subject of research, and set some housekeepers at least to thinking. If every loaf of bad bread mennfactured from good flour, every overdone or nnderdone piece of meat prime in original quality, every mese of potatoes ruined in the kettle, every muddy cup of coffee made, every dish of every sort that might be palatable and nutritious, bnt which by carelessness, ignorance, or neglect is made tasteless and mediocre—if ell these could be written down in a book, with dates and specifications, and the average cook confronted with them once a year, what consternstion would or should fill her heart, and whst e fearful aggregete of meteriel wested beyond redemption would appear in the account.

The fact is that cookery is entitled to rank among the exact sciences, and that happy accident's are of rare occurence in the culinary domain, while unhappy acoidents are constantly happening. There is continually the golden mean to be sought in the admixture of all the elements that are to make up a savory meal, and such is "the total depravity of material things," as one of our witty writers once phrased it, that if there is one chance in ten of things going wrong thet chance is sure to befall.

To cook a potato exactly right, so that it will be just done, and no more, be mealy, white, pertect, requires en exercise of thet talent little short of geuins, so one would think who eats that vegetable at ordinary tables. The same is true of onions, that odorous bulh, which is almost always served underdone; of beans, which ere either burned in the baking or dried to a choking consistency. Now a hungry epicure even can make a good meal off three or four things—nicely cooked meat, perfectly prepared potato, a dish of ripe fruit, and exemplary bread end hutter. It is not variety or qneutity that is so important as quality, and if those who cook could only reelize this and precipitate all their powere upon the perfect preparation of only two dishes at each meal, those who feed at their hands would certainly be the gainers. It is e great deal easier, when one has really made up her mind to it, to have everything just right thsn it is to let things drift, for one right thiug fits into another right thing and theu the whole is right. Badly cooked food is not only sheer waste of raw material, bnt it ceuses waste in nerve, muscle, soul power. The hungry body vainly attempts reeuperatiou in tryiug to digest and assimulete food not "convenient" for it, so that whst might have heeu accomplished had the food beeu right remains undone.

Apropos hereto and for the help of careless cooks the followiug extract from an unpnblished bnsiness letter is given: "Having writtenu an hour or so I found the inner roomiuess large and descended to breakfast. The order was scrambled eggs, steak, codfish cake, coru cekes, muffins, stewed chicken, and chocolate. The eggs were so old they smelt, the chicken even worse, the coru cskes tasted like sawdust, and the butter was oleomargarine or worse. The muffins turned ont to be one small hut good grahsm biscuit, burned to a cinder at the top; the chocolate wss flat end bitter. But the hotel is central and elegant; the furniture is costly; the walls ere frescoed; the mirrors are large; the darkies are olever; the bills are ample; the lady boarders wear scant skirts with ruffled humps; and how rude it would be to suivel about the mere victnals! I won't do it. I went without my breakfast, paid for it with effusive cheerfuluess, tipped my hat jaunti1y in taking leave of the haudsome cashier, and knew that I hed had jnst as good a time as the other fellows!"—*N. Y. Tribune.*

French Recipes for Cooking Potatoes.

Puree of Potatoes. — This differs from mashed potatoes only in the employment of more milk and butter, and in the whole being carefully reduced to a perfectly smooth, thick, creamo-like mixture. Where economy is a great object, and where rich dishes are not desired, the following is an admirable mode of mashiug potatoes: Boil them till thoroughly done, having added a handful of salt to the weter, then dry them well, and with two forks placed heck to back, beat the whole up till no lumps are left. If done rapidly, potatoes thus cooked are extremely light and digestible.

Potatoes Sautees.—These are even more agreeable with meat than fried potatoes. Cold boiled potatoes are sliced up, and tossed np in a seucepan with butter, mixed with a little chopped parsley, till they are lightly browned. Pure goose or other dripping is by many cooks preferred to butter for this purpose.

Potatoes Soufflees.—Theee delicious blistered potatoes are prepared as follows: The potatoes, if small, are simply cut in halves; if large, cut into three or more slices; these are fried in the usnal way, but are taken out before they are quite done, and set aside to get cold; when wanted they ase fried a second time, but only until they sre of a light golden color, not brown.

Cream Tomato Soup.—To one quart of sweet milk, pnt one pint of cooked tomatoes. When it comes to a boil, add, one teaspoonful of soda and a half teecnpful of rolled cracker, and season as for oyeters This soup is very nice.

MINING AND SCIENTIFIC PRESS.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY, W. S. EWER, GEO. H. STRONG JNO. L. BOONE

Office, No. 224 Sansome St., S. E. Corner of California St., San Francisco.

Subscription and Advertising Rates:

ADVERTISING RATES.—1 week.	1 month.	3 months.	1 year.
Per line.....	.25	.80	$2.00	$5.00
One-half inch.....	$1.00	3.00	7.50	24.00
One inch.....	1.50	4.00	12.00	40.00

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper inserted at special rates.

SUBSCRIPTIONS payable in advance—For one year, $4; six months, $2.25; three months, $1.25. Remittances by Registered letters or P. O. orders at our risk.

Prompt Subscriptions.

We wish to thank those subscribers who send in their renewals to the PRESS promptly as regularly as the year comes round. It saves us much expense in commissions for collections and renewals. May we not request more of our good patrons to do so!

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus and terms of subscription.

MINING SUMMARY from the various counties in California, 212-13.

USEFUL INFORMATION.—Freezing Water in Bottles; A German Invention; A New Cement; Driving Screws into Hard Wood; Composition of Metaline; Hard Pressed Tea; Ammonia Paper Board; New Balloon Experiments; A Proper Precaution, 215.

GOOD HEALTH. Fever and Ague; Sick Headache; Hygieia—The Goddess of Health; Cured by Laughter; What Every Wife Ought to Know; A Fourth Set of Teeth, 215.

DOMESTIC ECONOMY.—Imperfect Cookery; French Recipes for Cooking Potatoes; Cream Tomato Soup, 215.

MISCELLANEOUS.—Gold Mining in Virginia; Ventilating Coal Cargoes; One Effect of Bad Art; Preparing for the Centennial—Progress of the Exhibition Buildings; The Land of Horses; The Hoosac Tunnel, 210. The California Watch Company; Triple Cylinder Engine; To Cleanse Kerosene Casks; Completion of the Hell Gate Excavations; American Agriculture; How the Rust Grows; Size in the Eye; Celluloid; Development of the Iron Trade; The California Wine Crop, 214.

WHY FRANCE IS PROSPEROUS.—During the first half of this year, France imported goods to the value of $342,200,000 and exported to the value of $385,500,000, so that she sold only $43,300,000 in excess of what she bought, and, though this is not a large sum, it is always on the right side of the books. But she imported only $45,000,000 worth of manufactured articles and exported $212,800,000, and the manufactured articles she exported paid for all the natural products and raw material she bought. In other words, her industry paid for a great portion of the material it brought in, and purchased in addition all the foreign products required in excess of the native products to feed the people.

THE GREAT SILK MANUFACTURING STATE.—New Jersey boasts of forty-five silk manufactories (out of a total of 170 in the United States) taking the lead in this respect of all other States, Massachusetts and Connecticut alone excepted. Paterson is the central point of activity. Work is very active at these mills at the present time. The value of raw silk annually consumed by them is about $7,500,000 in gold.

GERMANY COPYING AMERICAN STYLES OF WORK.—The *Hub* is authority for saying that several carriage making firms in Germany have commenced building for their home trade what they term "the light American work," and they expect to create a fashion and consequent demand for such productions. The Germans are acting upon the national proverb — *Prufet Alles und behallet das Beste*—examine everything and keep the best.

A New Business Era.

What an eventful period has been the past six weeks! What whirlwinds have been in the minds of our leading business men! What a shuffling of coin and computing of balances! It is well these visits of financial tumult are few and far between. The failure of the Bank of California, which so startled our community, like all other changes, will eventually produce its good, although dearly bought lesson. In the shuffle, which the past few weeks has made, a new deal all around of much of our surplus capital will be made. A new business era, we may say, is now inaugurated. One of more calculation, and less dash. One more legitimate in its ventures. Legitimate labor and enterprise of merit will have more than ever the fostering care of capital. The speculative, rash and totally reckless operations that have been a leading feature of many business men, belong to the past—buried with the first quarter of a century which inaugurated it. We are now entering on a more staid, calculating and refined (if we may use the word) business era. Men to thrive, must become producers. "Stocks on the Board" must possess merit to command coin. Gambling in holes in the ground is probably dead. It is to be more labor and more reward for it. It is a new move on the business chess board, even in the Bank of California, which of itself, when it opens its doors, will open a safer, more calculating, sober institution than ever before. As it was a fitting representative of the bold and vigorous quarter of a century past, it ought to be the grand representative of the more cautious, calculating and stable quarter we have now entered upon. The business outlook of our State never was better; our mines are throwing forth their treasures and with millions of increase; our industries are thriving, with our grain, wool and other articles of export looming up greater millions yearly. We have nothing to be despondent over, as regards the future; on the contrary, there is a greater stimulant for every branch of legitimate industry; for within the next four months, the vaults of our banks will possess millions of surplus capital.

Steam Road Wagons in Nevada.

In Southern Humboldt, near the Churchill line, about eighty miles south of Winnemucca, there is an extensive salt marsh, capable of

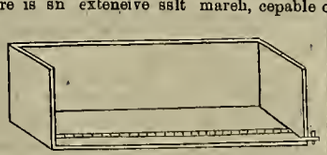

Fig. 3. Leaching Box.

supplying the whole country with that mineral. This salt has been proved by analysis to be almost chemically pure; and for domestic and mill purposes is not excelled in the world. In the vicinity of this marsh extensive beds of high grade antimony ores have recently been discovered, and the prospects for an unlimited supply of that metal are unsurpassed in the United States. Notwithstanding the practically inexhaustible quantities of the articles, both of which are almost universally used, the deposits, owing to their remoteness from the railroad, are comparatively valueless.

As the want of sufficient capital to construct a railroad through that region precludes such means of communication, the *Silver State* proposes that as there is a good natural road from the line of the Central Pacific railroad to Winnemucca, steam road wagons be used for purposes of transportation. If experience should prove the feasibility of using these vehicles, it will have an important effect, not only in that particular region, but upon numerous other sections, at present considered as unapproachable.

AN AMERICAN REAPER IN EUROPE.—It is said that the greatest reaper trial ever held in Germany has just closed at Angenumber. The highest prize, a gold medal, was awarded to an American harvester.

A New and Promising Gold Field.

Encouraging mining reports are being received from the central and southern portion of Colorado. It appears from information recently furnished the San Juan (Arkansas) *Prospector*, that there is a region of country to the south of the three great Parks, and on the easterly slope of the dividing ridge between the headwaters of the Colorado and Arkansas rivers, which promises to become a valuable mining section. The country is occupied by the Ute Indians, and the miners and prospectors there have had the good sense to acknowledge the Indian rights to the country, by paying them for the privilege of prospecting and mining them. Under this arrangement the work of prospecting is proceeding without interruption and under the most friendly relations. Negotiations are made with their chief, Ouray, and include certain designated streams or gulches, usually of considerable extent.

One of the localities is at what is known as Taylor's Park, a region quite as extensive as Middle Park, and well supplied with water. Several parties are gulch mining there, and all reported to be doing well.

South of this is Union Park, where several other companies are reported to be at work; and all perfectly satisfied with the results of

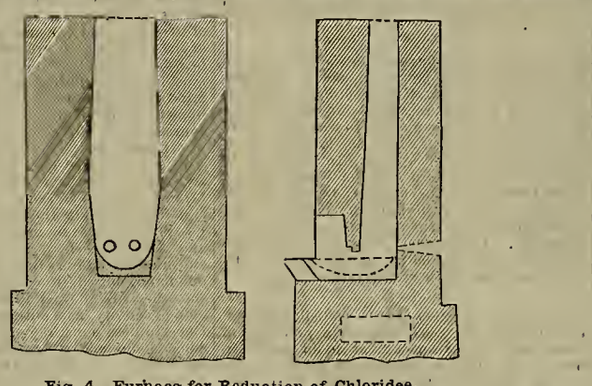

Fig. 4. Furnace for Reduction of Chloridee.

their labor. They expect to be able to continue operations through the coming winter, notwithstanding the high elevation of the country—some 8,000 feet above the sea level. One party, which has made a contract with Ouray for a certain gulch, say that all they want is one full season of uninterrupted work. It is said there is a party at work in this vicinity under the direction of Professor Hayden, who, at last accounts, were getting their ground in readiness and expected to realize at least $10 per day to the hand.

Surrounding this particular locality it is said are mountains in which great numbers of quartz veins occur, some of which bear unmistakable evidence of richness, although no attempt has yet been made to either prospect or locate them. At a short distance from this is what is known as the Elk mountain country, in which there are some silver bearing veins, which have been prospected to some extent, but are thought to yield only low grade ore.

Coal of a fair quality has also been found in

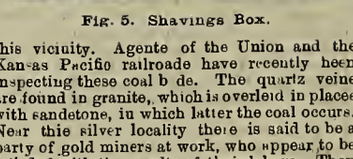

Fig. 5. Shavings Box.

this vicinity. Agents of the Union and the Kansas Pacific railroads have recently been inspecting these coal beds. The quartz veins are found in granite, which is overlaid in places with sandstone, in which latter the coal occurs. Near this silver locality there is said to be a party of gold miners at work, who appear to be satisfied with the results of their labors. They give the Utes a small portion of their gold for the privilege of working. Although there is an abundance of rain here, and the natural vegetation is abundant, the frost and cold nights renders the country of little value for agricultural purposes, other than grazing or dairying. The food supply of the region will come from the rich and warm valleys to the east.

"STATISTICIAN" FOR SEPTEMBER.—A copy of this publication is received. It is just what it claims to be, and, this number, like its predecessors, contains a great amount of information given in the most available and practicable form.

MANY of Healdsburg's enterprising citizens are in favor of boring an artesian well in the center of the plaza.

A NEW steam saw mill is being put up on the timber land in Lake county, near Allens' Springs.

Giant Powder against Hercules Powder.

A decision was rendered a few days since by the United States circuit court, which not only on account of the value of the rights in issue, but also of the matters involved, has excited considerable interest, especially among mining men.

In May 1874, the Giant powder company, a well known corporation of this State, manufacturing and dealing in Dynamite or Giant powder, brought suit against the California powder works, another corporation manufacturing and selling the high explosive known to the trade as "Hercules powder." In this suit it was alleged by the Giant powder company that the other company in making and vending Hercules powder, was infringing three letters patent of the United States claimed to be owned by them. These patents were numbered respectively Nos. 5,799, 4,818 and 4,819.

It appeared from the bill of complaint that all these patents were re-issues of original patents, the first being a re-issue of a re-issue of one patent and the two last being divisional re-issues of another original patent, No. 50,617. In 1869 the assignees surrendered this and procured in its place four separate re-issued patents, and in 1872 they surrendered one of these and obtained in its place two new patents, Nos. 4,818 and 4,819. This gave them five patents in place of the original one issued to Nobel in 1865.

The California powder works, defendants in the suit, after having all the patents, both surrendered and outstanding placed upon the record, demurred, claiming that it appeared from an inspection of the bill and patents that the patents Nos. 4,818 and 4,819 were for inventions not mentioned in the original patent from which they sprung, and that therefore they were void. After the argument, the plaintiff, the Giant powder company, confessed the demurrer and having obtained leave to amend, after some delay filed an amended bill and the decision rendered a few days since was upon the demurrer to the amended bill of complaint. The amendment alleged that Nobel originally filed with his first application in the Patent Office a memorandum, in which he mentioned some of the compounds claimed in the re-issued patents, but that his attorney had left them out by an amendment, and that the original patent was thus issued without them.

The court was composed of both Justice Field, of the supreme court of the United States, and Justice Lorenzo B. Sawyer, of the circuit court, and each filed opinions. The case was argued for the plaintiff by Messrs. Felton, McAllister and Wheaton O'Rally and Messrs. Gifford, of New York, and Bakewell, of Pittsburg, by brief, and for the defendants by Messrs. W. W. Cope and C. R. Greathouse. Judge Field sustained the demurrer and held that the original patent No. 50,617 was for modes of using liquid nitro-glycerine; for a process for exploding the liquid, and did not mention, or cover, any compounds of known or unknown ingredients; and that as the re-issues in question were for compounds composed of nitro-glycerine and other substances, there was no connection between the inventions covered by the original patent and the re-issues, and consequently the latter were absolutely void.

He further held that under the patent law of 1870, the Commissioner of Patents, could not, in chemical patents, grant a reissue for any invention other than that mentioned in the original, and that the provision of the act permitting the commissioner to go outside of the record and take proof, was limited to machine patents, where there was no model or drawing. It was also held that if Nobel was the inventor of the compounds, he should have made independent applications instead of attempting to cover them by re-issue. Judge Sawyer concurred specially, holding that as the original patents were issued under the act of 1836, the right to re-issue must be determined by it, and under the doctrine laid down in Seymour *vs.* Osborne, 11 Wall., the re-issue could only embrace inventions described, suggested or indicated in the original.

Some of the points decided are new, and the case is peculiarly instructive, as showing the necessity for care in preparation of papers for patents in the first instance, and how rights of great value may be lost by the employment of incompetent or irresponsible patent agents.

CLOSING OF THE FAIR.—It has been officially announced that the Mechanics' Institute Fair will close on Saturday, October 9th. The premiums will be awarded on Wednesday, October 6th. The great carnival will take place on the evening of November 5th.

THE opening of the Felton railroad for business will take place during the first week in October.

A NEW soap factory has been established at Alvarado.

MT. HAMILTON, the site of the Lick Observatory, is 4,448 feet in hight.

THE *Bulletin* and *Call* folks have sued the *Alta* folks for $25,000 damages for libel.

Metallurgy of the Copper-Silver Ores of Inyo County—No. 5.

[Written for the Press by SAMUEL PURNELL.]

The Leaching Process Continued—Extraction of Copper.

The copper present in the first solution in the form of chloride, combined with the chloride of any iron present (lead and antimony having been precipitated by simple cooling of the solution), is now ready for removal. This may be accomplished by running it into tanks containing metallic iron, when the copper is precipitated as a metallic state as cement copper. About eighty-eight parts of iron will go into the solution as chloride in place of one hundred parts of copper precipitated. In place of using metallic iron the copper may be precipitated as an oxide by carbonate of lime; but in this case any iron or other chloride present would also be deposited and render the copper impure. The roasting, however, might be so managed as to convert the iron into oxide and therefore insoluble. Should the copper be precipitated by metallic iron the iron going into solution may be recovered as oxide by precipitation with lime. In some localities the copper and iron oxides may be reduced to metals in a shaft furnace with profit. Otherwise the oxides can be sold. It is probable that the copper could be crystallized out from its solution with advantage. Being in the form of chloride, it could be reduced with charcoal and lime in a furnace, and thus furnish the metal at one operation, Fig. 4. Fig. 3 shows the leaching box described last week.

Further Recovery of Silver.

As considerable undecomposed salt remains in the ore after roasting, and as chloride of silver is soluble in a concentrated solution of common salt, some silver is dissolved and carried out with the base chlorides. It is regained simply by diluting the leach water as it flows away, and offering an abundance of surface for the chloride to deposit on. A disadvantage is that the chlorides of lead and antimony are also deposited and have to be separated by after treatment. The amount of silver so carried out is small, seldom exceeding one or two per cent. Another plan for regaining this silver, introduced by Mr. O. Hoffmann, consisted in conveying the leach water into the box through a bottom cock, under slight pressure, upward through the ore till the water reached the top, then the cock was closed and water admitted on the top as usual. By this dilution the chloride was precipitated in the box. The leaching was then conducted in the usual manner. This plan, however, did not give as much satisfaction as the former, as some silver was still lost.

The best plan is to have the chloride solution, in which may be some silver, diluted with water in a series of shallow boxes filled with any porous and neutral matter (shavings), on which the chlorides of lead, silver and antimony are deposited, Fig. 5. When the silver accumulates on this porous matter in sufficient quantity the whole may be removed and leached with hot water and hyposulphite the same as though it were ore. The silver is thus all regained. A number of other methods may be used to save this silver. Among others, the iodide of potassium process of Claudet. Or the leach water may be passed over plates of metallic copper. The process of Claudet for ores directly is not applicable to existing affairs here. Care should be taken to employ no more water for leaching than necessary, or the solution may be too dilute to act on the iron.

Further Facts.

It has been commonly supposed that this is a very slow process and suited only to a small concern, and also to one only where the highest professional skill must be almost exclusively employed. The very contrary is the fact. Pans will not usually work over a ton of ore in twenty-four hours, while in the same time a leaching box may work from five to ten tons. As for the skill required, it is of course necessary to have at least one person around who is thoroughly familiar with every part of the process. Every other workman may be of the ordinary kind. In Mr. Kustel's works, near this city, the laborers are all Chinamen, and the only others employed are a night and day foreman. No process is so suitable for all kinds of ores as this, as will be plain by a careful examination. It is exactly suited for a class of ores which are exactly unsuited for amalgamation or smelting. It is also a cheap process, as from silver-copper ores the silver may be extracted to 90 per cent., at a cost (from crushing to discharging tailings) of from $10 to $15 per ton, varying with the locality and skill employed. It requires no pans, or settlers, or quicksilver, or blankets. Except the ornshing machinery, nearly all its apparatus is of wood. Coarse crushing only being necessary, stamps can put through more rock than usual. A works of the same capacity as an ordinary amalgamation works can be erected for one-third the amount the latter would cost; and thus there is a better proportion of capacity to cost of plant. If erected in a bad location it can be more readily taken down and removed to a better.

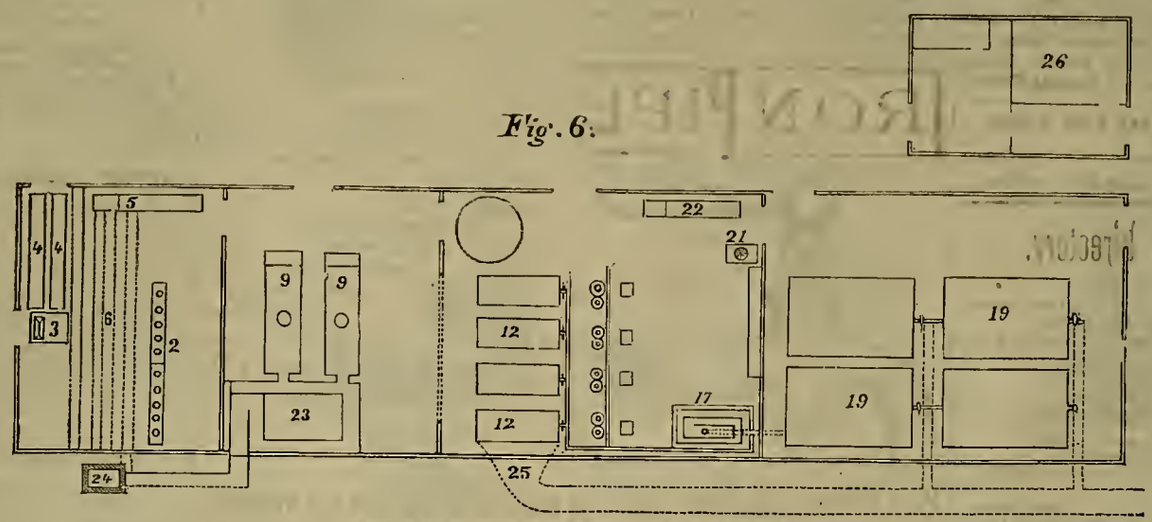

Fig. 6.

THE LEACHING PROCESS—PLAN OF WORKS.

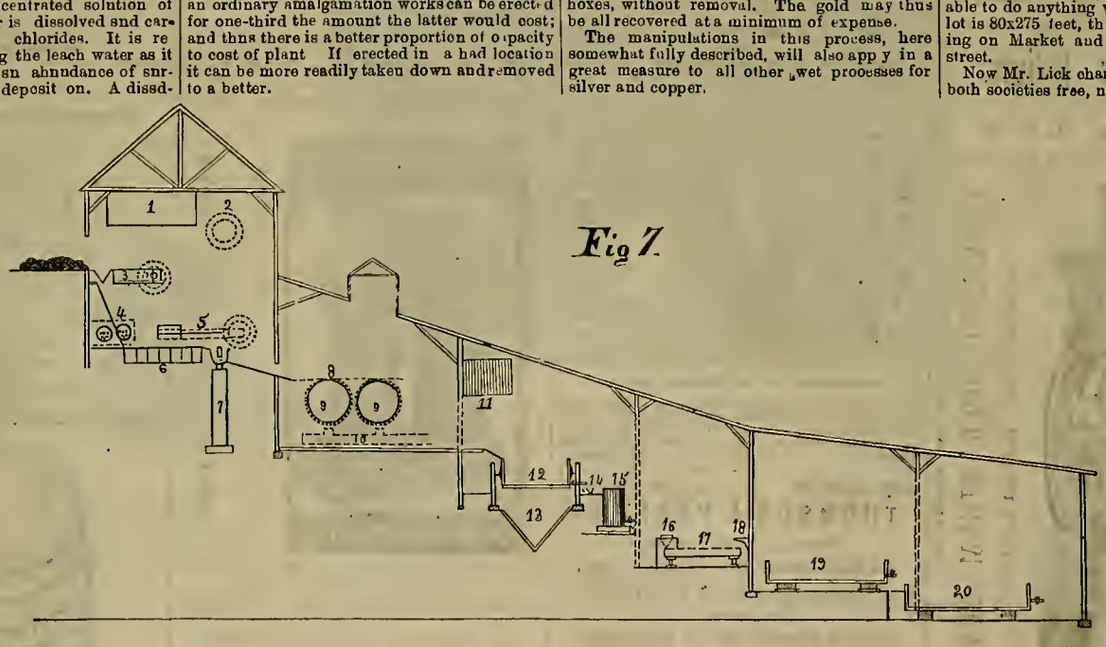

Fig 7.

THE LEACHING PROCESS—SECTIONAL VIEW OF WORKS.

This can be seen by referring to Fig. 6 and 7. Fig. 6 gives a plan of works, and Fig. 7 a sectional view of solving process works. The details are as follows, the numerals in both engravings up to number 20 referring to the same things: 1, water tank; 2, cam shaft of ten-stamp mill; 3, Blake crusher; 4, boilers; 5, engine; 6, dry floor; 7, bed of stamp battery; 8, mixing floor; 9, Bruckner's furnace; 10, cooling floor and boxes; 11, tank for solving solution; 12, leaching box (this is intended to turn on its axis and lift the tailings out into the sluice); 13, sluice for tailings; 14, waste pipes; 15, precipitating tubs; 16, filter; 17, box of wood shavings; 18, shelf; 19 and 20 boxes for precipitation of base chlorides. In addition to the figures in Fig. 6, which refer also to this, 21 is the screw press; 22, reverberatory furnace; 23, duct chambers; 24, chimney stack; 25, sluice for tailings and water; 26, assay room and office.

The openings represent doors. The mill is represented as being built on a hillside. The sketches are not drawn to any scale, except that the relative proportions are about correct. The capacity per day would be 10 to 15 tons of ore.

It may be stated that with the class of ores under consideration, it is scarcely possible by the pan process to work them closer than to 50 per cent. of the fire assay, or to turn out bullion more than 500 or 600 fine. The solving process will extract the silver to over 90 per cent., give bullion over 900 fine, and save such base metals as may be desired. The latter are necessarily destroyed in the pan process. The quantity of water required is but little more than for pans, and if water is scarce it can be used over and over again. It can be carried on in all weathers. Any number of boxes may be arranged and the capacity thus increased to any extent. The proper degree of concentration for the hyposulphite may vary slightly with each ore; but it is soon determined by experience. The less base metals in the ore the more concentrated it may be, and *vice versa*. Very rich ores, as well as poor ones, are suited to this process. With most ores about twenty-four hours would be required to pass them completely through the works. Very rich ores will require a longer time; perhaps three days. Any gold remaining is in a favorable state for chlorination, which may be performed in the same boxes, without removal. The gold may thus be all recovered at a minimum of expense.

The manipulations in this process, here somewhat fully described, will also apply in a great measure to all other "wet processes for silver and copper.

Processes have been introduced in Europe during the last few years for the extraction of silver by means of acids, but they are not adapted for use in this country at present.

A process for the simultaneous extraction of gold, silver and copper has been employed in Hungary by Patera and Roeszner with success. It was reported that 98 per cent. of the silver, all the copper, and nearly all the gold was saved. The process is, in short, roasting to sulphates, and then chloridizing with salt, then leaching with a cold concentrated solution of common salt through which chlorine gas has been passed to saturation. The gold, silver and copper are dissolved. The gold and silver are precipitated by metallic copper, and the copper subsequently by iron. With some ores it would be best to leach simply with hot or cold water, and afterwards with the chlorinated salt water. This would remove all copper, lead and antimony, and avoid the precipitation of the lead and antimony with the silver and gold. Where an ore contains considerable gold and little base metal this process may prove valuable, and might be a cheaper mode of extracting it than by chlorination after the solving process, or by regular chlorination. As far as known this process has not been tried on a large scale in this country, but there can be no doubt of its adaptability with great profit in some cases. The precipitated gold and silver may be separated by "parting" or by chlorine gas.

The Pioneers and the Academy of Sciences.

All the business arrangements with relation to relieving the old Board of Trustees of the Lick Trust, and the appointments of the new ones, having been perfected, it is probable that immediate steps will now be taken to carry out Mr. Lick's wishes with regard to the trust. Some changes have been made in the deed and these appear wise ones. One very important one is that of taking the sum of $240,000 from what was set aside for statuary, and adding it to the sum for founding the School for Mechanics' Arts. This will give that school a sum total of $540,000. The statues will be made and erected but not in so elaborate a manner as was anticipated. Mr. Lick has also given deeds to the California Academy of Sciences and Society of California Pioneers for their property on Fourth and Market streets respectively, free from all restrictions whatever.

It will, perhaps, be remembered that he presented to the Society of California Pioneers and the California Academy of Sciences each a piece of land near the corner of Market and Fourth Sts., some time before the Lick trust deed was drawn up. The restrictions, however, were so heavy that neither society was able to do anything with the property. Each lot is 80x275 feet, that of the Academy fronting on Market and the Pioneers on Fourth street.

Now Mr. Lick changes these gifts and gives both societies free, unrestricted deeds to these respective properties. They can go ahead and mortgage if they choose to build, and when completed can rent part of their buildings, which they could not do under the other deed.

This will set both societies on their legs. The Academy was in rather an embarrassed position, although with great prospects ahead. The present building where the meetings are held is a damp and disagreeable one and in an unpleasant locality. Probably immediate steps will now be taken to have suitable buildings erected, which will be not only useful but an ornament to the city. Mr. Lick has shown sound judgment in relieving the embarrassments of these societies, by giving them their new deeds free from restrictions, and they will, no doubt, take immediate possession and commence to build.

SUCCESSFUL CULTIVATION OF RAMIE.—Bakersfield *Courier* Sept. 25: We were shown some stalks, or rather stems of the ramie plant, raised by Mr. Drury on the other side of New River about twelve miles from Bakersfield. The ramie plant has been tried here before, but never by any one who had any knowledge of its culture, and therefore the attempt was not attended with success. Mr. Drury, however, has demonstrated that it can be produced here in its perfection. The conditions of soil and culture are not at all exacting; in fact the plant is a native of the jungle, and only requires rich soil, moisture and warmth to reach its highest development. These conditions are all found here, and Mr. Drury exhibits specimens of the plant from seven to ten feet in length.

PHYLLOXERA.—Petaluma *Argus*, Sept. 24: The phylloxera, which has done considerable damage to some of the vineyards in Sonoma valley, has as yet but slightly injured any of the vines in the yards of the Buena Vista Vinicultural Society.

Averill Chemical Paint,
MANUFACTURED BY THE
Cal. Chemical Paint Co.

PURE WHITE, AND ANY SHADE OR COLOR.

This Paint is prepared in liquid form, READY FOR APPLICATION—requiring no thinner or dryer, and will not spoil by standing any length of time.
It is Cheaper, more durable, more Elastic, and produces a more Beautiful Finish than the best of any other Paint.
It will not Fade, Chalk, Crack, or Peel off, and will last twice as long as any other Paint.
In ordering White, state whether for Outside or Inside use, as we manufacture an Inside White (Flat) for inside use, which will not turn yellow, and produces a finish superior to any other White known.
Put up in ¼, ½, 1, 2 and 5 gallon packages, and in Barrels. Sold by the Gallon.
For further information send for Sample Card and Price List, or apply to the office.

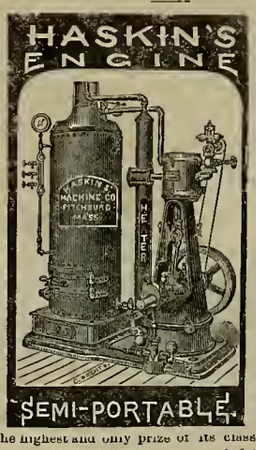
1874. A GRAND SILVER MEDAL. 1874,



(From 1 to 10 Horse Power.)

PARKE & LACY, Sole Agents,
310 California Street.
SAN FRANCISCO.

The highest and only prize of its class given to any Vertical Engine was awarded to the
HASKINS ENGINES AND BOILERS,
BY THE
MASS. CHARITABLE MECHANICS' ASSOCIATION,
at their Fair in Boston, in competition with the Baxter, New York Safety Steam Power and the Sharpley Engines.

AMMONIA!
For Washing and Cleaning Purposes.

For Sale by all Grocers.

This article is universally used in Europe, and, recently introduced for general family use in San Francisco and neighborhood, is already in great demand. It is now the intention of the manufacturers to introduce it all over the Pacific Coast, at prices which will bring it within the reach of every household.
It is unequalled for cleansing Woolen Fabrics, Cutlery, Carpets or Crockery; for Scrubbing Floors, Washing Paint, Removing Grease Spots, Shampooing or Bathing.
It renders water soft, and imparts a delightful sense of coolness after washing.
DIRECTIONS.—For Laundry, use two to four tablespoonfuls to a washtub of water. For bathing, use one tablespoonful in the bath tub. For removing grease spots, apply with a brush, undiluted, and wash with water afterward. For stimulating the growth of plants, use a few drops in every pint of water used in watering.
PRICE.—Per Pint Bottle, 25 cents; per quart Quart Bottle, 40 cents; per Half Gallon, 75 cents.
Also, SULPHATE OF AMMONIA for chemical purpose, fertilizing, and the preparation of artificial manures AMMONIACAL PREPARATION, for the prevention and removal of boiler scale. CRUDE AMMONIA, for general manufacturing, and PURE LIQUOR and AQUA AMMONIA for chemical and pharmaceutical purposes.

Improved Cast and Forged Steel Shoes and Dies for Quartz Mills.

[PATENTED MAY 26TH, 1874.]

Price Reduced to 16 Cents Per Pound.

SAN FRANCISCO, November 10th, 1874.

To Supts. of Quartz Mills and Mining Men generally:

We take pleasure in stating that owing to the rapid increase in our orders, our Pittsburg Manufacturers have been compelled to add largely to their works—a new gas furnace and heavier trip hammer—and are thus enabled to reduce the cost of steel and at the same time produce SHOES AND DIES superior to any yet manufactured. We have consequently reduced the price to 16 cents per pound and solicit a trial order, guaranteeing that you will find them at least 10 per cent. cheaper than the best iron. There are no STEEL SHOES AND DIES made excepting under our patent and sold at this office, or by our authorized agents, though certain Eastern manufacturers advertise STEEL SHOES AND DIES which are only cast iron hardened by the addition of a composition. They will not out-wear two sets of common iron, though called steel. They are very brittle and are not capable of being tempered, flying from under the hammer like cast iron. Our STEEL SHOES AND DIES are in use in many of the largest mills on the Pacific Coast, and all who have tried them pronounce them cheaper and far superior to iron in every respect, even at the old price of 20 cents per pound. Their advantages over iron are cheapness on first cost, increased crushing capacity, time saved in changing and in setting tappets, increased value of amalgam by absence of iron dust and chippings, and a saving of 75 per cent. in freight. It takes 50 days to fill orders from the manufactory East. Price 16 cents per pound shipped at San Francisco. Terms liberal.

Address all orders, with dimensions, to W. R. Townsend, Secretary.

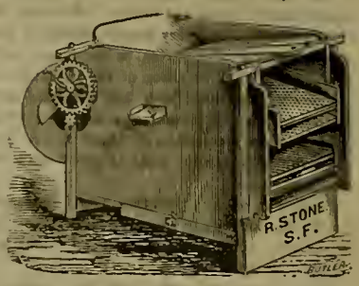
THE PATENT

Novelty Mill and Grain Separator



Is one of the greatest improvements of the age for cleaning and separating grain, while it combines all the essential qualities of a first-class Fanning Mill. It also far excels anything that has been iuvented for the separation of grain. It has been thoroughly tested on all the different kinds of mixed grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of Wheat if desired. For further information, apply to

Pleasant Talks About Inventions.

The era of improvement may properly he said to have commenced in 1400. Previona to that time there is a very mesger record of the onward march of progreaa in mechanios and arts. With the exception of the invention of gunpowder, clsimed both by Germany and China, snd that of steam as a motive power, (the prsctical application of which waa aa yet nnknown,) thera were nona of great value to tha world.

Several important inventions and discoveriea mark the fourteenth contnry, while many of lesser note added to the comfort and development of civilizstion.

Hata, so common now, were first invented in 1404. Algehrs wss first introduced into England hy the Saracena, in 1412. Paper made of linen rags waa the production of the year 1417. To England is accorded the honor of the invention and nae of the mnsket in 1421. A very naefnl if not a grest invantion was that of pumpa in 1425. Diamonds were first cut and polished in 1439. In 1441 printing waa invented hy Faust, a German. Most persona ara familiar with the traditionsl letters carved on the hark of a trea, the embryo type that were destined to merge into the grsnd art which ia so prolifio in practical benefits to the entire humsn race. England wss slow to aieze npon thia new discovery, and it was not nntil 1474, a lapse of 33 yeara, that the art of printing waa introduced into that conntry by Caxton. Aa a natural aequence engraving on wood followed in 1460, and engraving on copper by an Italian in 1480.

With the general diatribntion of wookege through the medinm of the printing preas, came the necaasity of hetter poatal facilities. Poatoffices were first established in France in 1464. The system was soon sdopted throughout Eurnpe. The year 1470 wss rich in the produotion of almanaca at Buda, and the invention of caata in plaster at Florence by Verichio. A rapid stride waa made in the musical world by the invention of the violin in 1477. This year was also marked hy the invention of watches at Nuremherg. The first watch ia ssid to have besn as large round as a hat, with cnmbersome msohinery, and a striking apparatus that told the honra snd quarters, with force enongh to awaken the seven sleepera. Canals in modern atyle were built for the first time in Italy, in 1481. The Greek language was introduced into England hy Groeyn, in 1491, and map and oharts were unknown to the aame country until 1489. Spinning wheela were invented in 1330, and playing carda for the smusement of the French king, in 1390. Dice, it ia recorded, were invented 1500 years B. C., and hellows 554, B. C. By thia it wonld appear that gamestera and hellows menders were aa common in early timea as now.

The various inventions of the fourteenth centnry were each of msterial benefit to acience, art or commerce. But acience is the most indehted to the three grest discoveries, printing, watchea, and muakets. The first disseminates and preserves it; the second aids it at every atep, and the science of war immeaaurably sdvanced hy the third. Germany, the firat in grand reaults, has not been since snperseded in the race hy any country except tha United States. The new republic's multitndinona and great inventiona being in keeping with its rapid growth snd proaperity. M. J. K.

TREATING THE WRONG DISEASE.

Many times women call npon their fsmily phyaician, one with dyapepsia, another with palpitation, another with tronhle of the hreaat, another with pain here and there, and in thia way they all present alike to themselvea and their easy-going and indifferent doctors, separate and distinct diseaaes, for which he prescribes hia pilla snd portions, aaauming them to be anch, when, in reality they are all aymptoms caused by aome nterine disorder; and while they are thus only ahle perhapa to palliate for a time, they are ignorant of the cauae, and encourage their practice until large bills are made, when the auffering patients are no hetter in the end, but probahly worse for the delay, treatment and nther complications made, and which a proper medicine, directed to the cause wonld have entirely removed, thereby inatitnting health and comfort inatead of prolonged misery.

From Miss Lorinda E. St. Clair, Shade, Athens Co., Ohin:

"Dr. R. V. Pierce, Buffalo, N. Y.—Your Favorite Prescription ia working almoat like a miracle on me. I am hetter already than I have been fnr over two yeara."

From Ella A. Schafer, Zanesville, Ind.:

"Dr. Pierce—I received the midicine yon aent me and began using it immediately. As a resnlt of the treatment I feel better than I have for three yeara."

From Mas. John K. Hamilin, Odell, Ill:

"Dr. Pierce—The Favorite Prescription haa done me gnod, which I am very thankful for."

Dr. Pierce'a Favorite Prescription is sold by dealers in medicines.—*Com.*

In forty-eight hours a cough may become dangerous; but within that time any cough can be cured by the use of Hale's Honey of Horehound and Tar. Sold by all druggists.

Pike's Toothache Drops cure in one minute.

Mining and Scientific Press.—On the 3d inst. this paper, published by Dewey & Co., at 224 Sansome street, San Francisco, entered upon its thirty-first volume. It is, beyond a donbt, the best journal published on the Pacific coast for the scientist, mechanic and miner, and should receive the most liheral support. It costs much money, to say nothing of patience and endurance, to publish an ordinary paper; but the amount required of all these to publish such a paper as the Press can hardly be realized by amateurs or those not having had any experience in the publishing and printing business.—[Panamint News, July 14th.

Santa Clara, Cal., April 6th, 1875.

Messrs. Dewey & Co.—*Gents:*—We have just received Patent No. 160,535, for J. T. Watkins & Co's Mammoth Road Grader, which was patented through your Agency. It is the neatest and best that we have ever received. We feel proud of it and thankful to you for the care and attention that you have given it, and when we have anything to do in that line of business we will surely give you a call. Very respectfully,

J. T. Watkins & Co.

Thoughtlessness.—Persons sometimes return their paper, marked "stop this paper." Their name being pasted on the sheet they think that is all we need to be able to cross their names off. Now that is thoughtlessness. Your P. O. address is needed as much as your name. We have thousands of names arranged only according to locality. Our mailing clerk does not know where everybody lives.

Give Your full Address when you communicate on business to this office, especially in returning newspapers. The fact that your name is on our subscription list is of no assistance to us. Without sending your post office address we should have to look over thousands of names to find yours.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and Retail, by DEWEY CO., Mining and Scientific Press Office, S. F.

BY GUIDO KUSTEL,

Mining Engineer and Metallurgist.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quick silver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his speciality.

Price $2.50 coin, or $3 currency, postage free

Concentration of Ores (of all kinds), including the Oblorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Litbographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is bigbly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO $5.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of the general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

Price, $5 in cloth; $6 in leather—coin.

BY OTHER AUTHORS.

The Quartz Operator's Hand-Book; by P. M. Randall. 1871. Revised and Enlarged Edition. Cloth bound, 175 pages. Price, $2.

Sulphurets: What They Are, How Concentrated, How Assayed, and How Worked; with a Chapter on the Blow-Pipe Assay of Minerals. By Wm. M. Barstow, M.D.; 1867; cloth bound, 114 pages. Printed and sold by Dewey & Co. Price, $1; postage free. The best written work, and most complete work on the subject treated.

ANY OTHER BOOKS DESIRED will be furnished at the most reasonable rates by Dewey & Co., Mining and Scientific Press Office, S. F.

The Mining and Scientific Press.

[Established in San Francisco, 1860.]

Is the leading mining journal in America, and enjoys a large circulation among the more intelligent operators and workers in the gold fields of the world.

As a scientific and mechanical representative of the Pacific Coast, it is decidedly popular and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivaled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer will find profit by its reading.

Subscription, $4 a year, in advance. Sample copies post paid, 10 cents. As an

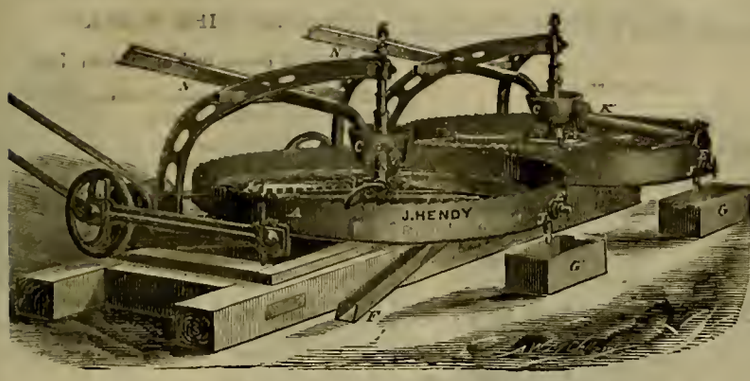
London — Consols, 93 to 93⅛; Bonds, 102⅝.

Quicksilver in S. F., by the flask, per lb, 65c.

OVER $3,500 PER MONTH SAVED

BY THE USE OF

Hendy's Improved Amalgamator and Concentrator



Can be seen at the Manufactory, No. 32 Fremont Street, San Francisco.

SAN FRANCISCO, Aprtl 27, 1872.

JOSHUA HENDY, Esq.—*Dear Sir:*—As a practical miner and millman, I take pleasure in recommending the use of your Concentrators in all mills where gold or silver ores are reduced. No mills should be without them, for the following reasons:

1st. They are good sizers (no perfect concentration in pulverized ores can be effected without first sizing).
2d. The best Concentrator I have ever known—(the concentrated stuff only containing 5 per cent. of sand).
3d. They are good amalgamators, light (feathery) particles of amalgam and particles of coated gold by attrition are brightened, and from their specific gravity and the action of the pan, fall to the bottom and adhere.
4th. They require but little power and attention to run them, and with ordinary care will last for years.

I have been familiar with the workings of your Concentrators for four years past; have run them myself in the North Star Mine, Grass Valley; am familiar with their practical workings on the Empire Mine, Grass Valley; St. Patrick, Placer Co.; St. Lawrence, El Dorado Co.; Oaks and Reese, Mariposa Co., and most cheerfully give you this testimonial. For further information you are at liberty to refer to,

Yours respectfully, JAS. H. CROSSMAN, M. E.

409 California street, or Cosmopolitan Hotel.

SAN FRANCISCO, February 10, 1874.

OFFICE SUPERINTENDENT OF KEYSTONE CON. M. Co., AMADOR, AMADOR COUNTY.

MR. J. HENDY—*Dear Sir:*—In answer to your inquiries as to your Concentrators furnished our company last July, I would say that I am more than pleased with them; and the saving to the company has been over $3,500 per month more than with the blankets and huddles formerly in use. O. C. HEWITT, Supt.

OFFICE SUMNER MINE, KERNVILLE, April 27, 1874.

J. HENDY, Esq.—*Dear Sir:* Having four of your Concentrators in use at our Mills for four or five months, which for saving Amalgam and for concentrating Sulphurets, are a success, beyond a doubt, I feel it a duty due you and those interested in Quartz Mills, to recommend them.

As further evidence of their worth, I now order TWELVE more of your Machines for our new Mill, now in course of erection. E. R. BURKE, Superintendent.

For description send for Circular.

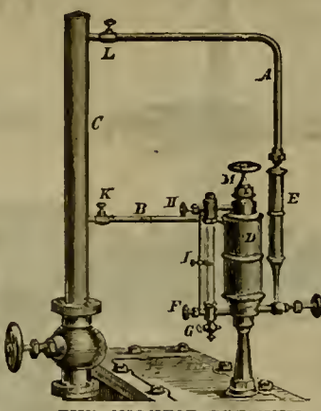
THE MINING AND SCIENTIFIC PRESS, of San Francisco, entered upon its thirty-first semi-annual volume last Saturday. It is most appropriately named, and sustains well its name, containing more really useful information upon mining, scientific and kindred subjects, than any other paper on the Pacific coast. Dewey & Co., the publishers, are well known as agents for securing patents; in fact, most of the patents for inventions on this side of the continent are secured through them. The PRESS is deservedly prosperous.—[Gold Hill News.

Thursday Noon our last forms go to press. Communications should be received a week in advance and advertisements as early in the week as possible.

A Good Binder for $1.50.

Subscribers or this journal can obtain our Patent Elastic Newspaper File Holder and Binder for $1.50—containing gilt title of the paper on the cover. It preserves the papers completely and in such shape that they may be quickly fastened and retained in book form at the end of the volume, and the binder (which is very durable) used continuously for subsequent volumes. Post paid, 25 cts. extra. It can be used for Harper's Weekly and other papers of similar size. If not entirely pleased, purchasers may return them within 30 days. Just the thing for libraries and reading rooms, and all who wish to file the PRESS. lamhp

N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the oup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23

PATENT AGENCY.

Mining and Other Companies.

Gover Mining and Milling Company—

Principal place of business, San Francisco, Cal. Location of works, Drytown, Amador county, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 3d day of September, 1875, an assessment of ten cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company, No. 402 Front street, room 8, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 11th day of October, 1875, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Saturday, the 30th day of October, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

W. O. WILSON, Secretary.

Office, No. 402 Front street, room 8, San Francisco, Cal.

Hope Quicksilver Mining Company—Location

of principal place of business, San Francisco, California. Location of works, Cinnabar Mining District, Sonoma County, State of California.

Notice is hereby given, that at a regular meeting of the Board of Directors, held on the 2d day of August, 1875, an assessment (No. 2) of Five cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, Room 2, No. 408 California street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 9th day of September, 1875, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Thurday, the 30th day of September, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

JACOB HARDY, Secretary.

Office, Room 2, No. 408 California street, San Francisco California.

POSTPONEMENT.—The date of the delinquency of the above assessment is postponed to the 8th day of October, and the date of delinquent sales to November 1st, 1875. By order of the Trustees. J. HARDY, Secretary.

September 8, 1875.

Keystone Quartz Mining Company—Principal

place of business, San Francisco, California. Location of works, Butte Township, Sierra county, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 22d day of September, 1875, an assessment (No. 5) of Fifty (50) cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company, northwest corner Pine and Sansome streets, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 5th day of November, 1875, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 29th day of November, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

LOUIS VESARIA, Secretary.

Office, northwest corner Pine and Sansome streets, San Francisco, California.

Mount Auburn Gold Quartz Mining Company.

Location of principal place of business, San Francisco, Cal.

54 BUSHELS OF CORN AN HOUR.

HARRISON'S LIGHT VERTICAL BURR MILLS

Barber & Bacon, Millers and Lumber Dealers, South Vernon, Vt., write July 15th:
"We have been running two of your Light Vertical Corn Mills for the past 6 months with remarkable results, and have ground over 80,000 bushels of corn into No. 1 meal in that time, running the grist-mill nights only, as we run our saw-mill in the day time. We have often ground in the 20-inch Mill (which weighs about 500 lbs.), 1,000 lbs. of corn in twenty minutes, or 54 bushels in one hour. Our usual night's work is about 24,300 lbs., or 434 bushels. To do this we have to run at a speed of 1,300 turns per minute, and use about a 20-horse power. You may refer parties to us for further information, and when we have tested your Heavy Vertical Mill, we shall take great pleasure in giving the results."

OF INTEREST TO

MINING COMPANIES.

A Mining and Civil Engineer, of long experience, collected in Europe and America, well acquainted with correct management of mines and mills, practised in projecting and constructing mining and milling machinery, and especially *machinery for mechanical ore concentration*, is open for re-engagement, and would prefer the task of constructing works for mechanical concentration of low grade ores on a well developed mine, or of remodeling ineffective works in the ore milling line for successful operation. Apply to Messrs. DEWEY & CO., of this office, for reference.

The Best Injector

For Locomotive and Stationary Boilers.

FRIEDMANN'S PATENT.

SAN FRANCISCO, SATURDAY, OCTOBER 9, 1875.

VOLUME XXXI Number 15.

An Improved Hand-Cart.

Hand carts are indispensible articles in this country, but most of these useful little vehicles are open to two objections: First, the impossibility of loading from the rear on account of the disposition of the vehicle to tilt; and second, the inconvenience of loading at the side, owing to the wheel being in the way. Both of these difficulties, it is claimed, are overcome in the invention illustrated in the annexed engravings, which consists in an arrangement of the bed so that it slides back and forth at the will of the operator.

A, is a frame attached to the axle of the cart, and further supported by the braced standards shown, which rest on the ground when the cart is stationary. On the top side of the frame are secured the metal runners, *B*, upon which clips, *C*, having eyes, and attached to the bottom of the vehicle body, fit. These clip eyes are loose upon the runners, so that the body can be moved forward from the axle, as shown in Fig. 1, to allow of loading without the interference of the wheel. When the loading is finished, the body is pushed back and balanced over the axle, as shown in Fig. 2. They are made different to suit all kinds of business. Fig. 3 shows a small one mounted on springs, but they can be furnished with or without springs.

It will be seen that the standards give the body a firm support when the same is pulled forward. The inventor suggests that, as there is no establishment in this country which makes a specialty of hand-cart making, a profitable trade might be monopolized under his patent.

The inventor, Mr. Joseph M. Jones, desires to dispose of his right for two-thirds of the United States; for further particulars regarding which offer, etc, he may be addressed at Paris, Bourbon county, Ky.

Fig. 1

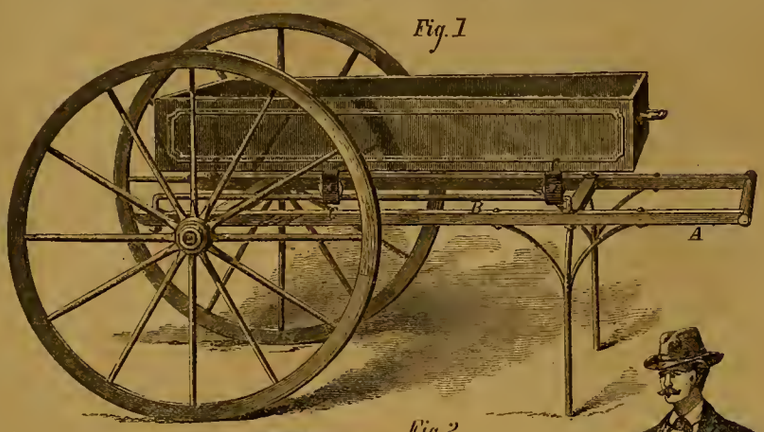

Fig. 2

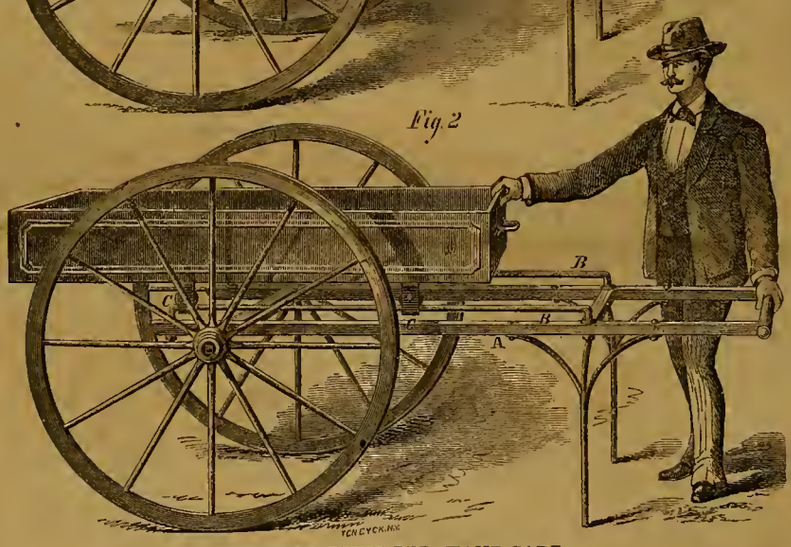

JONES' SHIFTING-BED HAND-CART.

Pleasant Talks About Inventions.

No. 2.

The spirit of invention, which had achieved such astonishing results in 1400, moved on apace in the fifteenth and sixteenth centuries. While nothing startling was discovered, valuable applications of known principles were developed, and successfully introduced. Steam during this time became subject to the skill of man, to the degree of proving undubitably that it would in time be the great motive power of the world.

Fortifications were first built in the present style in 1500. In 1503 sugar was refined for the first time by a Venetian. Shillings were first coined in England in 1504; gardening introduced into England from the Netherlands in 1509; while roses first bloomed on English soil in 1522. The camera obscura was the invention of 1515. Gunlocks were invented at Nuremberg in 1517. The first fire engine was built at Augshurg, Germany, in 1518, and was called "a water syriage useful at fires." Chocolate was introduced in England from Mexico, in 1520. Street lights were first employed in modern Europe at Paris in 1523 Soap made its earliest recorded appearance at London and Bristol in 1524. The application of steam to navigation belongs to the fifteenth century, for it appears that in 1543 one Blasco de Garay, of Barcelona, propelled a boat by steam, part of his apparatus being described as "a large kettle of boiling water." It is generally supposed that Dr. Guillotine invented the dreadful instrument of punishment which bears his name, during the revolution in France, in 1789. Such is not the case, he only recommended its adoption. The guillotine was known in Germany as early as 1595, and was called *fall beil* (falling hatchet). The romantic statement that Guillotine perished by his own device, is false. He died in bed. In closing the records of 1500 it would not do to forget two important items: The use of punctuation for the first time in literature in 1520, and the discovery of the true theory of the solar system by Copernicus in 1582.

Thermometers were invented at Padua by Santorio in 1626. The invention of air guns is claimed for 1645, but it appears that Ctesibuis, an Alexandrian Greek, who lived B. C., 150–120, applied the elasticity of the air to the construction of wind guns This would seem to verify the old adage, "that there is nothing new under the sun." Saw mills were introduced into England from Holland in 1663. Leather hose for fire engines was invented by two Germans at Amsterdam in 1670 They also invented the suction pipe. The first practical experiments towards establishing the science of electricity were made by Dr. Gilbert, of England in 1580–1595. He arrived at no conclusions, however, and it was reserved for a Franklin to test its power and demonstrate a theory.

The crowning work of the sixteenth century was the advancement made in developing steam as a motor. As early as 1663 the Marquis of Worcester had invented an engine worked by steam. It was a crude attempt, but originated what is now known as the high pressure principle. It was followed by Newcome's engine, in 1705, which was the connecting link between all former rude efforts and the engine that the genius of Watt developed into practicability and universal usefulness.

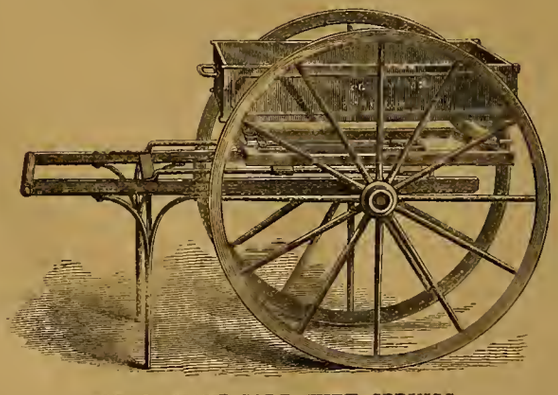

FIG. 3. HAND-CART WITH SPRINGS.

Swan's Box Nailing Machine.

In the extreme rear end of the Pavilion, in the display made by Swan's box factory, a new machine has been placed within the past few days, which attracts more than ordinary attention. It is a box nailing machine invented by Mr. G. W. Swan, which is really a wonder in its way. Although somewhat complicated in appearance, it is really simple in detail, and does its work with great facility.

The nails are poured into a series of troughlike hoppers, on the top of the machine. By these being slightly slanted, the nails slide into a sort of trough, with a slot in its bottom. As they fall into this the nails which are defective, or without heads, fall into a receptacle placed to receive them. In front of this the nails pass on, points down, to the front of the machine. At each revolution of the machine a nail drops into a receptacle where a pair of pliers pass it down and hold it ready for the bar of iron which acts as a hammer, except that it forces instead of hammering the nail into the wood. Ten nails can be driven at a time, either all of one size or of different sizes. The nippers hold the nail straight, so that it can be driven into the edge of a quarter-inch board. As the nails come down the machine turns them the right way to be forced into the wood without splitting it. Three or tenpenny nails can be used at the same time if desired.

Gauges are arranged so as to drive the nails at any desired distance apart; as they can be placed exactly in the center of a quarter-inch or two-inch plank at pleasure. It is so arranged that the cover of the box is only nailed loosely on, so the nails can be drawn. A man in making ordinary fruit boxes, can only nail together from 125 to 150 per day, with the material already prepared. This machine easily does the work of from eight to ten men, and does it accurately. One man only is required to tend it when in operation. It is really an ingenious piece of mechanism and one of great importance to the box manufacturers. A crude machine of this kind has been in use in Swan's box factory for some months, and such improvements as have suggested themselves have been carried out. Now that the machine is perfected the inventor has taken steps to protect his invention by patent. It is well worth examination by all who are interested in a fine piece of mechanical skill.

The enterprising Chicagoans are waking up to the value of Nevada silver mines viewed in the light of paying investments. A party of Chicagoans are making a business tour of the State buying wherever they think the prospect warrants a purchase. They were lately at Winnemucca and it is reported they have purchased the Maine ledge in Sierra district. Parties here in communication with them, inform us it is their intention to visit this place shortly and negotiate for the purchase of certain mining property in this vicinity.—*Pioche Record.*

The *Enterprise* states that the Livermore spring water company received early this week their fine steam pump and works, for hoisting water from the lower to the upper reservoir. When it is placed in position and in working order we will have not less than forty-two feet of fall upon our streets.

The track on the Santa Cruz railroad is laid to Gillingham's farm, on the San Andreas ranch, about fifteen miles from Santa Cruz. During the past week about 500 tons of sugar beets have been carried over the road to the Soquel sugar mills.

The Centennial Building.—We are indebted to the officers of the Centennial Exposition for a fine chromo-lithograph of the buildings, erected for the various departments of the Exposition.

The San Joaquin extension of the Southern Pacific railroad is graded to near the Santiago creek.

The Sonora *Democrat* says: We understand that a third and final survey of the country from Oakdale to the Rock river ranch in this county is being made by the railroad company, which would indicate their intention of removing the track from between Peter's and Milton on the Stockton and Copperopolis road and laying it on the route of this survey. This will bring the terminus of the road to within about twenty-five miles of Sonora.

They are running platform cars temporarily for the use of passengers between Santa Monica and Los Angeles.

The Lower Country Mines.

A gentlemsn who has recently msde a tonr through Southern Californis and visited several plsces of interest, writes a letter to the *Alta* of what he hss seen, from which we mske some extracts:

I left this city just a month ago, taking the Southern Pacific railroad, as far as its termination, then at Caliente; from there I traveled hy stsge to Los Angeles. When the Central Pacific company attempted to make a road over the Sierras, it was an enterprise of daring andacity—still it was completed, and filled the traveling world with raptures of admiration; hut that gigantic work along side of tbe engineering on the Southern Pacific, from Caliente through the Tejon pass and over the monntaius, was a mere child's play.

The traveler by the stages has an excellent opportunity of seeing the work now being accomplished by the railroad engineers, and from the commencement to its termination the mind of the traveler is imbued with a feeling of admiration and a realizing sense of the power of engineering mind and skill—that there is, indeed, "no obstacles to an engineer but time and money."

Passing on to Los Angeles, I could not hut endorse the oft repeated praiese of that "Eden of the West." It is a beautiful country, profnsely rich with the bounties of nature and as lovely a place for human ahode ae mortals could desire. It has a futnre before it in history that will, I think, justify the moet extravagant hopes of ite early settlers.

From there, my curiosity led me to take a snrvey of the eeacoast, and I stumbled upon Santa Monica, the last new town on the horders of the Pacific.

I had not been eo far south and west hefore, and as I stood npou the high hlnff on which this young city ie heing built, and gazing across this great expanse of Pacific watere that lay stretched before me, hounded only hy the clesr, hlne firmament, I did, indeed, conclude that not a word too many had been uttered in favor of this excellent selection of a watering place for the State of California.

Some men in the motivee of their actions—which grand of themselves they may be—may associate therewith a feeling of sordid selfishness, eo as to destroy the good they might at first intend; but as I let my eyes wander over the country, and take into my mental calenlation the inevitable resnlts of building such a city on the ehores of the Pacific, I could not but feel kindly dispoeed to the name of Senator Jones, to whose enterpriee the foundation of the city bas been laid.

Some men may accomplieh one great point of their ambition in a lifetime, and therewith he contented with a monumental name to he read in history; hut there are other men who are impelled by a love of enterprise, who cannot rest while there remains a something yet to he done—of this nnmher is the irresistihle Senator from Nevada.

Santa Monica ie beautifully sitnated, and may easily be all that ie expected of it in the futnre. It aims at no ahsurd pretentione of rivalry; it ie great in its own natnral situation, and is cspahle of becomiug a great seaport town, and these are what make the cities of the world.

No one who thinks of the first location of San Francisco on the verge of the waters of the bay and backed by hnge sand hille, could ever tbink ot the city of to-day; bnt it was in the very nature of human feeling, after a long sea voyage, to seek the first landing near to the ocean, and the city of San Francisco, in spite of everything, became a fact in the geographical and maritime history of the world, which neither riug nor Legislature, State or National, will ever be ahle to move.

So will it be with Santa Monica. Nature has given to that portion of the Pacific coast, a harbor of refuge from the storm, a secure place for commercial interchange of home and foreign produce, which stsmpe it ae pre-eminently the next seaport in importance to San Francisco.

It is not yet one year since the city of Santa Monica was snrveyed, and to-day there are over a hundred houees erected and inhahited, and every day sees the foundation of some new home laid. For location, in a commercial way, it is without a rival, for it has an open sea and deep waters in front, and hehind it there is a country increasing daily in importance to the settler and to the immigrant seeking a new home.

Whatever may he the inoreased facilitiee of railroad communication between San Francisco and the interior of the State southward, there can never he commeroisl intercouise with the moet southern counties on the bordere of the sea to equal that of the safe and oheap conveyance hy water; hence Santa Monica, for all heavy and cheap freight must neeesearily he the only landing place in the future.

But with a wide range of vision, and comprehending the unmistakahle march of eveuts, Senator Jones, after building a msgnificent wharf 1,700 feet into the eea, to which vessels of the heaviest tonnage could come up aud uuload and load again, tne Senator hss rushed forward the Los Angeles and Independence railroad, and iu a few days more there will be an uninterrupted commnnication between the whsrf at Santa Monica and the interior connties of the south, and connecting with other railroads already in operation. It seems almost needless to add, that the final resnlt of all this expenditure of brain, labor and finance will be a great increase to the tressury of the man who had the intellect to conceive and the arm to execute, and to his financial resources there need be no end.

From Santa Monica I traveled to

Panamint,

And there I visited the now mines, aud saw agaiu the labor of Sonator Jones. With his associates he had opeued up a new country, built roads, developed minee and constructed one of the finest etamp mills on the Pacific coast. There were in all, probably, two thousand persons engaged in the uenal occupations of a mining country, enjoying mail communication with the reet of the world. There might be two huudred mines located within a radius of three miles of Panamint, though at the present time tbere were only a few being regularly worked and developed, as there are bnt two mills at the present time in operation. The fine stsmp mill built hy R. C. Jacobs to work the Sunrise ore, is running regularly and turning out its full capacity of bullion. Senator Jones' mill with twenty stamps, and a Stedefeldt furnace, with a capacity of twenty-five tons a day, has been working thirty days on a second class ore, and were able to work up to 85 per cent of the aesay value. The hullion so far aggregates 888 fine. During the laet thirty days they have turned ont $60,000, which ie now on the way to this city. Thie mill is working on ores of the Hemlock and Wyoming mines, and in these two mines they have enough ore in sight to keep the mills running for twelve monthe. These ores average $125 a ton, and the mill has capacity for turning out from $60,000 to $80,000 a month, while the expenees for milling and mining will not exceed $10,000; the Senator has, therefore, an ample, yea, an abundant return, for all hie investments and lahors, and a very handsome future before him.

The Panamint mines look very encouraging, and the feare that the refractory ores could not he worked remuneratively have been satisfactorily dispelled by the large shipments of hullion now on their way to thie city.

I next vieited

Darwin, a New Mining District,

Ahont forty miles in a northwestern direction, only about ten months old. This is a flonrishing little town with ahout 700 or 800 inhahitants. Water has been hrought by pipes a distance of eight miles to snpply the town. The ores of thie camp are argentiferous and are strictly smelting ores. A furnace of twenty tone capacity hae hsen erected and is doing fine work. The bullion is of very high grade. The mines sll look permanent, and with small investments in development expose large bodies of ore. I look upon this camp ae one of the most promising in Inyo county. Capital has already found its way tbere to stimulate the brawny arms of "ye honeet miners," and ite futnre is very enconraging. Lee dietrict is located about fifteen miles northeast of Darwin, but ae yet but little developments have heen done in that camp. The ore is of a very high grade, and the veins seem to be etrong and permanent. Rich croppings show for several hundred feet along the eurface. Twenty-five tons of ore from this new district have heen shipped to San Francisco, and I have seen the sample assay of this twenty-five tons, which average $430 per ton. Very rich ore is found from the graes roots as far ae they have gone. Twenty-feet is the deepeet shaft yet sunk, and the veins seem strong and permanent. Wood and water are ahundant within six miles from the mines. I predict a very good outcome for this new camp.

Having heard conaiderable of the

Gold Mines

And extensive operatione in Kern county, I resolved to make a pereonal visit. Retnrning to Caliente again, I there took the stage for Haviiah. Thie is an old mining town which had been almost abandoned for several yeare; but I found that latterly Messre. Haggin & Tevis, of this city, had taken hold of it. They had recently purchased several mines in that locality, and preparations were being made for extensive operations. The mines having heen more thoroughly developed, are proving to he very rioh and abundant in wealth. With the aid of these capitaliste, this almost abandoned country will again flourish, and they in tura will, in all probability, reap a rioh return for their investmente. It is the old story of money making tbe mare to go. The poor men failed; the rioh men are sure to he successful.

From Havilah I went to Kernville, and there I found a beautiful, lively town, with 1,500 inhahitants, located on the north bank of Kern river. Ten or twelve yeare ago conaiderahle attentiou was drawn to rich placer mines in this locality; hut recently there has been great discoverie made in quartz ledges. Here I again came across Senator Jones, and wae startled with tho greatness of hie enterprises where I least expected to find them. He has erected here an eighty stamp mill, with the best water power in the country. This mill, I am told, is tbe largest gold mill in the world, and hae been built with all the latest improvements, and with the greatest care. It is the handsomeet piece of property that I have ever seen in a mining country. Soon after my arrival, I wae introduced to Mr. E. R. Burke, the manager—who is himself largely interested with Senator Jones, and I wss shown over their property, and throngh their immense mine.

I was perfectly astounded at the

Extent of their Operations,

For I had no idea that there was snch a mine on the Pacific coast. The Senator had expended here first, in the purchase of the mine, the water privileges, erecting the mill, the hoisting works, and the development of the mine, the sum of $540,000 before it began to make him any retnrn; bnt it has reached that admirsble position known as "a paying hasis," and all that remsins to be done is to secure its continued working. The mine itself is 6,000 feet in length, and the vein averages from 80 to 100 feet in width. It is the mammoth gold mine in the world. In this single enterprise, Senator Jones hae hefore him untold millione. The work already done is entirely satisfactory, and the returns far exceed the outlay. The mill has a capacity for reduction of 100 tons a day, and at the rate it would take centuries to exhsust what is already known to exist within his patents.

With such an immense hody of ore waiting for reduction, other mille will he erected as fast ae possible, and that almost unknown country will hecome, I donht not, as celehrated as the Comstock, of Nevada.

Senator Jonee has quietly attended to his interests there, and no one seems to have heard what he was doing; hut one of these days there will he a buzzing ahout a gold bonanza that wil startle the commercial world.

I presnme that his nsual reticence does not sufficiently account for the silence that the Senator has preserved over his rscent enterprises; hut now that they have each of them heing brought up to "a paying basis," and take their places on the credit side of the ledger, the world may expect to hesr of his grand success. He is destined, over that one mine alone, in spite of everything, to become the richeet man iu America.

The Raising of Commodore Perry's Flagship.

After the *Lawrence* had been disahled in the hattle of Lake Erie, it will he remembered that Perry left her during the engagement and made the *Niagara* his flagship until the close of the fight. The *Lawrence*, with great difficulty, was gotten into the port of Erie (the port at which she was hnilt), and after rounding the peninenla, floated up Misery hay unmanageahle. The next year, 1814, she was refitted and sent against the forts at Mackinse. Proving nnseaworthy from the terrihle drubbiug of the English the year previous, she wae brought back to Erie and sunk in Mssery hay, and has lain there ever since, doing duty ae a house for the numberless black bass which could be alwaye caught among the timbers, and a point of interest to he visited hy curiosity hunters. Enough Flagehip *Lawrence* csnes have heen sold to build four such vessels, hesides the resl canee, etc., that have heen cut from her timbers. The vessel was built by Daniel Dohhins, whose widow now lives, or did live a few years ago, in Erie, and who, while her huehand was cutting out timhers, etc., hoarded Commodore Perry and his staff. When the writer of this eaw her last in 1871, she was a smart old lady ninety-four yeare old, and bids fair to live to a hundred. We qnote from the Erie *Dispatch*, which wo are sorry to say does not give ae full details as desirable, hecause all would like to know the names of the proprietors, etc., of the hull; and in thie connection we suggeet that our Historical society secnre some portion of the *Lawrence* as relics. The *Dispatch* says:

"The glory of one of one of the chief points of iuterest in the harhor of Erie—that which hung aronnd the place hallowed by the remnants of Perry's victorious flagship, the *Lawrence*—has departed. Her remains have heen lifted from their quiet resting-place nnder the waters of Misery hay, and carried shoreward to the edge of the peninsula, bringing to view the hietoric relic."

The removal is looked upon with diefavor by the majority of onr citizens, and it is not to he wondered at, as the *Lawrence* has heen lying there so long that she was accounted pnhlic property, and in the snmmer time was visited by hoets of strangers—the framework on one eide heiug visihle—to whom, as well ae to our citizens, it was an object of greater interest.

The remains are a queer looking mass. The port sido has heen cut down nearly to the keel, plauking having heen torn off, and ribs sawed off by those who thought it no harm to steal a piece of wood off the *Lawrence*, and this has been kept up until at least a third of her bottom has gone. The *Lawrence* lay on her starboard eide, and that side ie tolerably whole to the deck beame (npper worke all gone yeare ago), and the timher ie, in general, sound and in good conditiou, but is a purple black—the result of the actiou of the water.

Of the twenty-seven killed in that naval engegement twenty-two were killed iu the *Lawrence*, on board of which was the intrepid Perry, whose monument ornaments our public square. The *Lawrence* wae 100 feet long, twenty-eight feet heam, and nine feet depth of hold. In her time ehe was a model war vessel, but in these days of ironclads, monitor rame aud heavy armament she would not last as long in an engagement ae a yawl hoat in a hurricane. She fulfilled hor mission, however, and gave her Englieh consins cause to remember her contemporary with Perry's famous victory. —*Cleveland Plaindealer.*

A New Invention Relating to Steam Engines.

A new invention relating to steam engines is described in the *Trade Review* as helow. The inventor is a Cleveland man:

"The invention consists of a new and simple mechanical movement, wherehy the power of two cylinders is applied to the crank, in snch a manner ss to mske it a lever of constant value, and the full power of both pistons is exerted in opposite direotione on the crank wrist at the time the latter passes the center; this power is constantly transmitted in the direction in which the crank moves, and never, at any point of the revolution, is there any thrnst towards the shaft. The following is an outline description of the main features of the invention: The rectilinear motion of the pistons is preserved hy means of cross heads and gnides, in the usual manner; connecting rods extend from these cross heads to the opposite horizontal arms of a cross. The upper vertical arm of the cross is pivoted to one end of a vihrating heam, which is in tnrn pivoted, at the other end, to the frame of the engine; thie allowe a rectilinear, oscillating motion of the cross. The lower vertical arm of the cross is connected with the crank wrist. The valves of the cylindors are set to give to one pieton an advance or lead over the other, by which means the one piston will have reached the end of its stroke and he ready for the return, before the other will have completed two-thirds of its stroke, and the oross, acting ae a lever of eqnal arms, receives the full power of both pistone from opposite directions, thereby forcing the crank wriet up to and heyond the line of centers; having accomplished this much of a complete revolution, both pistone now act npon the oroes in the same direction, the crose movee hodily, until the crank wrist reachee a point forty-five degrees in advance of the line of centers, when the relative position of the stroke of the two pistons will he reversed from that stated ahove, and the same action is repeated to hring the maximnm power of the two cylinders to hear upon the crank wriete, at the time it passes the line of centers. The avoidance of all shocks, hy the uniform appl cation of power, rendere a great rednotion of the etrength of different parts possible, and great economy of space is gained by a material shortening of the connection.

"Mr. Miner has for a reverse and cnt-off gear, a moveahle eccentric, which secnres all the advantagee possessed hy the hest srrsnged link motion, while, at the same time, there is no variation in the lead of the valve; thie allows of operating the valves of both cylindere hy one single eccentric."

An engine conetrncted on this plan ie in use at the Cleveland *Herald* office, and it ie claimed that it savee a large percentage of fuel. Another has heen placed on a new tng at Cleveland now receiving its finishing touchee.

Government Survey of Lake Ontario.

The following are some of the partionlars in regard to the United States survey of Lake Ontario:

The survey party in charge of the work consisted of five distinct corps, each numbering about twenty men. Each party takes a section of ten miles—making a survey of coast line of fifty miles at one time. They have just completed the survey of the whole shore of Lake Ontario, topography of the shore and soundings heing olearly marked. The party at the mouth of the Niagara river are just finishing the survey of the river, from Lewiston to Navy island. The soundings at these points have not been so satisfactory as at other points of the river. At the new enspension hridge good results were ohtained, the lead nnder the hridge showing a depth of 192 feet, while a little below the depth varied from 162 to 165 feet. The hight of the American falls is 158 feet—an accurate meaenrement, as hy the assistance of a guide the lead wae placed at the base of the falls near the "Shadow of the Rock." It will be observed that the above measurement of the American falls is the same as former surveys give of the Horse Shoe or Canadian falls, viz., 158 feet, while the previous measnremente of the American falls is stated at 164 feet in perpendioular hight. The line of the Americau falls, nsually stated as 200 feet in length, is so rsgged that it is difficnlt to obtain any exact meaenrement. The survey party intend to overcome this difficulty hy the nse of mirrors, hy throwing a light from one side to any deeired point on the other shore. It is believed that the disputed question whether the line of the falls te extending np the river will be settled, tbough doubts are entertained whether the snrvey of 1842 can he relied npon as a correct hasie of calculation. The reenlt will be watched with interest, as will aleo the survey of the Horse Shoe falls.

Poor Oil.—Nothing is worse economy than poor oil, whether for lubricating, tapping, drilling, or whatever use it may be put. Oil that contains grit or earthy matter is nothing but liquid grindstones, and it cuts or ahrades the edge of the tool precisely as doee a grindstone or emery wheel. Gnmmy oil is nearly as had, for it adde to the friction of the tap and waetes power.

Old gilt window cornices and frames may be made to look like new by using a very soft sponge and tepid water.

SCIENTIFIC PROGRESS.

The Late Texas Cyclone and the Signal Service Bureau.

The efficiency of the United States Signal Service department hos been olearly dleplayed on a great number of occasions, and oos particularly on this coast, whereby, no donbt, mnch damage and dismstsr wns saved to shipping in this harbor. The last, and psrhops one of the most notable instances of its efficienoy, was evinced on the occasion of the late cyclone, which borst with such terrific violence on the coast of Tsxas.

This storm origiosted, probobly, in the Carribean sea, or to the ea-tward thereof, and thus mostly ontside the stations of observation, either nnder the direction of the Bureau or connected with it. Bnt certain marked atmospherio distnbances wore noted npon its northern nurgin in Georgia ond Florida, from which it was interred, three days before it had reached Texas, that a cyclone was raging somewhere in the neighborhood of Cuba. The indications grew quite dacided on the 13th ult, and danger aignals were ordered up nlong the Atlantic coast from southern Florida to Cape Hatteras. On the 14th tha indications were still more decided, but it was evident that the cyclone was moving more directly west than was at first snpposed, and it was ordered that the signals on the Atlnntic coast should be lowered nnd thosa on the Gulf from Mobile to Texas should be raised. Had thera been stations at Galveston and Indianola, danner signals could have been ordered np there also. The next dny, Sept. 15th, the storm burst with the most intense fury on the ooast of Texas, where it wrought the terrible destruotion, the full particulars of which are now reaching ne by mail.

Important Oaseavations on Sound.—Prof. Osborne Reynolds, read a paper at the late meeting of the British Science Association, on the refraction of sound by the atmosphere, nnd related the effect of experiments which he had recently made, with a viaw of throwing light on the subjeot. He had confirmed his hypothesis that, when sonnd proceeded in a direction contrary to that of the wind, it was not destroyed or stopped by the wiud, but that it was lifted, aod that at sufficienily high elevations it could be heard at as great distances as in other directions, or as when there was no wind. An upward diminution of temperature has been proved by M. Glaisher's balloon ascents, and he showed, by experiments with the sounds of firing of rockets and guns, that the upward variation of temperature had a great effect on the distance at which sounds ooald be heard. By other observations he found that, when the sky was cloudy and there was no dew, the sound could invariably be heard mnch farther with than against the wind; but that, when the sky was olear and thera was a heavy dew, tho sound could be heard as far against a light wind as with it. Professor Everett remarked that Professor Reynolds had given the most important contribution to the subject that had been given for very many years.

The scienco of paleontology forms on immense field of observation, and one that widens more and more every yesr. It is now estat-lished (1st) That the stratified rocks containing organic remoins admit of a division into four great groups, representing four great periods of time—*a*, the palæozoic or ancient; *b*, the mesozoic or middle; *c*, the Cainozoic or tertiary; and *d*, the qoaternary or modern periods. (2d) That each period is distinguished by its own hieroglyphio characters, which are engraven on the rocks in definite and determinable characters. (3d.) That these hieroglyphios are the fossil remains or imprints of aoimals that lived in the water in which the sediments were formed in snccessive layers on the earth's crust, and are only found in tha rocks they distinguish, so that it is possible to determine the age and position of the strata from which they have been collected, or, in other words, *identify the strata by organic remains;* and by this key we are enabled to read the pages of the rock book, study the history of extinct forms of life, and determiue their distribution in time and space.

Ruaaer from Milkweed.—A substance similar to and answering all the purposes of India rubber, has been prodnced from the common milkweed—*asclepias cornati*. By the action of fermentation on this weed, the yield of elastic vulcanizible gum is largely increased and very much improved in quality, as compared with that obtained from the unfermeuted weed. The result of experimenta give a yield of five per cent., and it is thooght the yield might be inoreased if the weed was ground to a greater degree of fineness before fermentation.

A Moving Panoaama.—Among recent curious inventions is the application of the camera obscura to a railroad car, imparting to the traveler and wondering beholder a moving diminutive piotnre of the oountry through whioh he is passing.

Fused Boracio Acid.—Fused boracic acid, which spproaches glass in some of its external charactsristics, presents some propsrties worthy of note. In tho viscid stats it may be drawn out into threads, which sobdify rapidly, and from this point of view its ductility rsther resembles thot of silica than of glass. Its hardness, between foor and fivs, places it betwsen fluor spar and apatite; it scratches glass, and is with difficnlty attacked by sand, aod evsn by emery, dry or with oil. It takes seven to eight times as much time in grindiog as glass nnder the same oircumstaoces. This resistance to friction, which does not accord with its hardness, dspends, doubtless, as M. Damour hns recognizsd in the case of other minerals, on a specialty of structure. Melted boracio acid, in mass, becomes slowly hydrated in contact with water. In powder it is ooted on rapidly, as shown by Ebelmen. If the powder is sprinkled with water, its temperatore may rise to 100°. Boracio acid is ohi fly remarkable for the persistence of its temper. If poured upon a cold metallio snrface, glassy plates are obtoined, the undor surface of which, obilled by the metal, is moro strongly tempered and expandad than the upper. Henco results a flection which may be strong enough to caose the ruptura of the plate and its projection in fragments. If poured into oil it may be obtained in small masses with short tails, under the same conditions as Prince Rupert's drops. A tempered plate of boracic acid, with parallel surfaces, acts upon polarized light like tempered glass; but while the latter loses this property by reheating, boracic acid preserves it with great tenacity.—*V. de Luynes.*

Wave Motion.—Prof. Gntbrie, of England, has been investigating the question of wave motion, and in a paper read nt the meeting of the British Science Asaociation, he said his endeavor in various inquiries was to determine the rate of wave progress. The rate at which the wave moved along depended very little indeed upon the hight of the wave, nothing at all upon the breadth of the wave, nothing upon the density of specific gravity of the liquid, but almost entirely upon the wave length—that was, the distance from crest to crest. The learned professor demonstrated by means of experimeuts that, in circular troughs, the smaller the diameter the more rapid was the pulsation, and that the rate in different sized troughs varied inversely as the square root of tha diameter. It was also found that in a circular trough a wave 39.4 inches in length traveled in one minute over 270 feet.

Lighting up Solid Bodies.—Cadogan Morgan, in 1785, was the first experimenter who produced the electrial light in the interior of solid bodies. He inserted two wires in wood, and caused the spark to pass between them. The wood was illuminated with blood-red or with yellow light, according as the depth at which the spark was produced was greater or less. Many of our readers have doubtless seen an egg or a series of eggs lighted np by being placed in the line of the discharge of a Leyden jar. An ivory ball, an orange or an apple may be illuminated in a similar way. According to Tyndall, a lemon is especially suited to this experiment, "flashing forth at every spark as a spheroid of brilliant golden light. The wires used for the discharga should be brought within about half an inch of each other inside the lemon or other object.

Sun Spots and Ozone.—Careful observations appear to show that sun spots have an important bearing on the prevalence of ozone in the earth's atmosphere. Mr. T. Moffat (Eng.) states that from 1850 to 1869 he discovered that the maximum and minimum of atmospheric ozone occured in cycles of years. He had compared the number of new groups of sun spots, in each year of these cycles, with the quantity of ozone, and the results showed that in each cycle of maximum of ozone there was an increase in the number of new groups of sun spots. He also showed that there is an increase in the quantity of rain and the force of wind with the maximum quantity of ozone and sun spots, and a decrease in these with the minimum of ozone and sun spots.

Cnarents of Aia Within Cyclones and Water-Spouts.—In a memoir on cyclones and water-spouts, Mouchez publishes some observations made by him while upon the ocean, and which, if correct, are quite important. According to him, at or near the surface of the ground, the movement of air in the cyclone is always from below upward, while in whirlwinds the movement is, on the contrary, from above downward. In the former case the winds are winds of aspiration; in the latter the wind descends from the cloud in the form of a bag, or tube, which terminates in a point. He believes that water-spouts have no relation whatever to cyclones, having an opposite appearance and cause. In this opinion Renou also coucurs.

Chemical Action in Porous Filters.—In the course of an examination of filters, at the instance of the *British Medical Journal*, Prof. Wanklyn has had proof that filtration through beds of porous materials includes very powerful chemical action, albuminoid matter being instantly resolved into ammonia and other products by the action of the filter, which, indeep, behaves in this respect like a boiling solution of permanganate of potash. A good filter is a sanitary engine of great power.

MECHANICAL PROGRESS.

An Adding Pencil—A Novel Device.

A potent is now pendiog before the Commissioner at Washington for an odding peucil, which the *Scientific American* pronounces ingenious and useful. The object, saya that jouroal is to facilitate ths labor of account ants in oddiug np long columns of figures. It is a minatnre calcoloting mochine, which performs its work with unfailing scoorocy aod without reqoiring any thonght on the port of the operator, other than that involvsd in notiog that a pointer points to the proper figure to be added. In shape it resembles a pencil, being no larger, and as easily manipulated.

The device has a metal case, the lower portion of which is provided with a longitudinal slot, similar to the old fashioned pencil cases, with each of the figures from one to nine marked upon its margin. A small pointer works up and down in this slot operated one way by presure with the point of the pencil upon the paper, and the other way by a coiled spring within the case. The upper portion of the pencil is grooved spirally, and marked with figures from 1 to 700, this last nnmber being considered as large as any convenient column of figores will aggregate. These fignres have also a pointer, which is raised by the same presure, which raises the digit pointer.

In adding a column of fignres the operator presses the peocil upon the lower fignre in the column until a correaponding number is noted by the lower or digit pointer. This involves also the pushiug up of the upper pointer to the same figure. The pencil is then raised, the lower pointer forced back by the spring to 0, and now pressed upon the next figure, say six until the lower pointer indicates that fignre, when it will be found that by the same action the upper pointer indicates eleven—the sum of the two, and so on through tha column, when the total is set down—and if there be any number to carry from one column to another, instead of being set back to zero, it is adjusted to that oumber, so that that is added in, as it should be, with the next sum.

There is simply no possibility of error in the operation, unless the user deliberately sets the digit pointer to tha wrong number. A little practice will enable him to cause that pointer, however, to stop at the right figure almost instantly, so that the column will be cast up nearly as quickly as he can touch the separate figures, and as claimed by the inventor, much quicker than the average arithmetician can perform the same mentally. Interruption during the computation is no annoyance, and, indeed, the motion may proceed almost mechanically while engaged in conversation. Or he may stop work in the middle of a colnmn, attend to other matters, and resume it after any period of time. So long as the pencil is not altered in the interval, the results will be absolutely correct.

An Iron Safety Railway Caariage.—We have lately seen a small model of the frame work for a railway carriage which its inventor, a Mr. Massey, hopes to introduce as a means of alleviating the horrors of a collision when such a casualty occurs. It is well known that the splinters of an ordinary carriage, when it is smashed, do almost, if not quite, as much harm to passengers as the shock of an accident. In fact the idea has been suggested, and we think patented in the United States, of employing papier mache as a constructive material, on the special ground that it would do but little damage in accidents. Mr. Massey proposes to construct the framework and partitions of his carriage of iron hoops, put together in a manner which must be seen to be understood, but which reminds us more of an iron bedstead of intricate pattern than anything else. An elastic framework is thus provided which will certainly withstand a considerable pressure, but experiment and calculation alone will decide how far it will resist the shock of a collision. Of course, it is to be encased and finished with some other material more pleasant to come in contact with than "cold iron." The inventor, besides claiming increased safety for this carriage, is confident that it is stronger and more economical than those of the present pattern.—*Iron.*

Science and Work.—With all the enthusiasm that has been excited of late years on the subject of technical education, the question does not seem to progress with anything like a speed commensurate with its importance. That, however, chiefly obtains in the higher departments of labor, and this often seems to be somewhat overlooked. A navvy wheels his barrow with no more speed and deftness from knowing the laws of motion; and even in departments of work considerably higher than mere hand labor, what education may be expected to do is more in the general elevation of the workman's character than in any special or direct assistance in his task. For once that a workman requires to refer to first principles there are a score of cases on which his competency must depend on training under the eye and the conscious or unconscious imitation of the methods of his seniors; and still more of his efficiency depends, as the correspondent of an evening contemporary, writing under the signature of "An Artisan," insists, upon his putting a due proportion of conscience into his work.—*Iron.*

The Steering of Screw Steamers.

In a paper read before the mechanical section of the British Association, Professor Osboros Reynolds, says: 1. That when the screw is going ahead, the steamer will turo as if she were going ahead, although she may have stern way on. 2. That when the screw is going reversed, the rudder will act as if the vessel were going astern, although she may be moving ahead. 3. That the more rapidly the boat is moving in the opposite direction to that in which the screw is acting to drive it, the more nearly will the two effects on the rudder neutralize each other, and tho less powerful will be its action. In reference to the effect of the screw to torn boat independently of the ruddor, the author states the following law: 4. That, when not breaking ths surface, the screw has no considerable tendeocy to turn the ship as long as ths rudder is straight. On the subject of racing, tho author stated that his experiments had enabled him to establish the following laws: 5. That when the screw is frothing the water, or only partially immersed, it will have a tendency to turn the stern in the opposite direction to that in which the tips of the lower blades are moving. 6. That when the boat is going ahead, its effects will be easily counteracted by the rnddor; but when starting suddenly either forward or backward at first the effect of the screw will be greater than that of the rudder, and the ship will go accordingly. 7. That if, when the boat is going fast ahead, the screw is revered, at first it almost destroys the action of the rudder, what little effect it has being in the reverse direction to that in which it usually acts. If then the screw draws air or breaks the surface, it will exert a powerful influence to turn the ship.

Paopelling Ships by Wave Motion.—Mr. Beauchamp Tower, read a paper before the engineering section at the late meeting of the British Association, on a machine for obtaining motive power from the motion of a ship among the waves. The machine, as described, consists in principle of a weight supported on a spring, so that it can oscillate on the spring through a considerable range in a vertiole line. The scale of the spring, and consequently the natural period of oscillation of the weight, can be varied at will. When it is so adjusted that it synchronises with the waves, the oscillations become very violent, and a large amount of power can be obtained from them. In practice, the springs consist of highly compressed air pressing on the rims of the hydro-pneumatio cylinders, and the arrangement is such that the vessel containing the compressed air forms the moving weight. The author exhibited a design of a machine for working an auxiliary propeller of a sailing ship of 1,800 tons displacement. The moving weight in this case is 200 tons, and he showed by calculation that it would give about 30-horse power in the long swell met with in the tropical calms, 260-horse power in average ocean waves, and more than 600-horse power in a heavy head sea. The space occupied by the machine compares favorably with a steam engine of the same power. M. B. exhibited a model of the machine, which recently, in a moderate sea, had yielded power at the rate of one and one-half horse power per ton of moving weight.

Paucellier's Parallel Motion.—Professor J. J. Sylvester, the celebrated English mathematician, in a contribution to *Nature*, of July 15th, states that this parallel motion is perfectly accurate, and that the Institute of France has quite recently adjudged its great mechanical prize—"Prix Montyon"—to Colonel Paucellier for his discovery. He states further that the "first practical application of this discovery, made by Mr. Prim under the sanction of Dr. Percy, may be seen daily at work in tha ventilating department of our Houses of Parliament. The workmen there, who never tire of admiring its graceful and silent action, have given it the pet name of the 'Octopus,' from some fancied resemblace between its backward and forward motion and that of the above named distinguished cephalopod. I feel a strong persuasion that when the inertia of our operative classes shall have been overcome, this application will prove to be but the signal, the first stroke of the tocsin, of an entire revolution to be wrought in every branch of construction."

A Novelty in Rifles.—The British Secretary of War has ordered an official trial of a newly invented rifle by Major J. P. Pieri, of the French army. The great novelty of the rifle consists in the position of the trigger on the top of the stock instead of underneath it. The trigger is attached to the cylinder which closes the breach, and forms the rear end of the spring, which retains the striker at full cock, and is protected against any injury by the two wings of the breech shoe. The situation of the trigger on the top of the stock has simplified the mechanism for closing the breech and firing, which consists of six pieces held together with a screw.

Wooden Linings for Furnaces.—As singular as it may seem, Mr. C. W. Siemens proposes the use of blocks of wood as a lining for rotary and other reduction furnaces employed in the production of iron. He would have the wood rendered incombustible by impregnation with metallic salts, and set in refractory mortar. He has made the idea the subject of a patent, application for which has been made at the English patent office.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

California.

AMADOR.

GOOD HOPE MINE.—*Foothill Ensign*, Oct. 2: This is a new mine, situated just outside the limits of Jackson. It has only been worked for about three months, and cannot be said to be more than a promising prospect at present. Charles Peters is the original locator, and still holds the principal interest in the claim. Being a poor man, and believing that the mine was valuable, some time ago he had it incorporated, dividing it into 50,000 shares, $2 per share, with the idea of securing some money to prosecute work upon it. The shares, however, did not sell rapidly, and Peters has been working it in the manner which his limited means will allow, raising the rock by horse power and striving to keep the shaft free from water by means of a whim. The shaft is now down 100 ft, the ledge continuing the entire depth, varying from 4 to 12 ft, and showing the widest at the bottom. The flow of water is now too great for the rude pumping apparatus to dispose of, and work in the shaft has been abandoned until better machinery can be procured. Rock is being raised from the 70-ft level, and 150 tons now lie on the dump ready for shipment. The value of the ore has never been ascertained by actual working, but it is estimated from $8 to $15 per ton. The mine is evidently in the great mineral bearing belt, and a part of the primary vein, and with the outlay of a small capital might be developed into a paying property.

RICH STRIKE.—One day this week, as a man known as French Bob was engaged in mining operations near Amador City, he struck an 8-ft quartz ledge, which is said to be exceedingly rich. We hear rumors to the effect that the discovery is upon the Keystone grounds, but whether this be so or not we are not prepared to say.

VOLUNTEER MINE.—The scarcity of water has compelled the mill belonging to this company to suspend operations until the rains set in. Nevertheless work is being pushed upon the mine. Five men are employed in taking out rock, and upwards of 160 tons of ore are now lying at the mine and the mill.

CALAVERAS.

NEW MILL.—Calaveras *Chronicle*, Oct. 2: The work of putting a mill on the Mount Tmolus mine, located in Jesus Maria district, is progressing favorably. The proprietors of the Mount Tmolus have purchased the 5 stamp battery formerly used at Lloyd's gravel claim in San Andreas, and are now hauling it to their mine. They have also bought an engine and boiler of the Kennedy mining company, in Amador county, and will soon have the machinery upon their mine. It is expected that the mill will be in readiness to commence crushing rock by the time the rainy season sets in. There is no question but that the Mount Tmolus will render a good account of itself when it is supplied with milling facilities.

WEST POINT DISTRICT.—Still another of the "worked out" quartz mines is being reopened by Mr. Ivancovich. It is situated some 400 yards west of the Mina Rica. The working shaft, 4x8 ft in the clear, is down 50 ft. Steam hoisting works will added as soon as the machinery arrives. The former workings were noted for high grade ore. Mina Rica shaft 180 ft. The rock in the bottom is harder, but the rich ore, struck last week, is swelling. The smallest portion of the ore shows free gold in abundance. The new hoisting works of the Cheeno work to a charm. Excellent progress is being made in the shaft; yielding ore worth $40 per ton. The scarcity of water prevents the mills from running steadily.

CONTRA COSTA.

QUICKSILVER PROSPECT.—*Gazette*, Oct. 2: The company owning the old Weloh quicksilver mine near Clayton, of which Mr. E. J. Ryan is the superintendent, have been now some months running their tunnel for the ore lead, and have recently struck it, in 300 ft and about 100 below the surface outcrop. The lead at this point has defined walls and is about 11 ft in width, with very rich ore, of which specimens were on exhibition at the Fair this week, estimated to be good for 50 per cent. of quicksilver. Everything in the appearance of the lead indicates its permanence, and even improvement at greater depth. With the assurance they now have of a rich and permanent vein, it is the intention of this company soon to run another tunnel on a level 100 ft lower.

INYO.

WORK AT DARWIN.—*Panamint News*, Sept. 29: By a letter from G. H. Willard, president of the company, owning the celebrated Defiance mine in Darwin, of which P. Reddy, Esq., is superintendent, we learn that Archie McDonald has received the appointment of foreman, and he is instructed to proceed to Darwin at once, take charge of the mine and place men to work by the first of next month. This is as good an appointment as could have been made, as Mac is not only an old and experienced miner, but is a gentleman in whom the greatest reliance can be placed, and who will leave nothing undone to advance the interests of his employers. The machinery for the furnace of the company will be on the ground, so we are told, in two or three weeks, and the furnace will be in operation by the 10th or 12th of November.

THE SUNRISE MILL AND MINE.—The Sunrise mill is running splendidly and has quite a large amount of amalgam on hand from which bullion will be made for shipment by the 1st proximo. Although but a 5-stamp mill we think, at the rate she is now working, that $28,000 to $30,000 per month will be turned out, and this without roasting the ore. The work of sinking on the ledge goes constantly ahead and the ore is constantly improving in quantity and quality. Altogether we think there is not a doubt but that the success of the mill and mine is assured.

NEVADA.

THE ARGENTA.—*Foothill Tidings*, Oct. 2: The tunnel running to open up this mining property is now in about 200 ft, and has just passed through a belt 52 ft thick of very hard blue rock, which impeded progress somewhat. The rock is now lighter, softer, shows a large percentage of pyritic mineral, and assays $12 per ton in gold. At 350 ft they expect to strike the ledge, and the miners at work say they have a sure thing on lots of pay quartz.

MANZANITA MINE.—The Nevada *Transcript* says: "W. A. Roberts is still making the claims of the Manzanita gravel mining company to disgorge heaps of gold. The center of the ancient river channel has been reached, and the gold is found to be considerably coarser. Pieces of gold worth $2.50 are frequently found now, and gravel from the bed rock was prospected the other day, which yielded $120 to the pan. Three shifts a day of eight hours each are employed in the several drifts, and the gravel is drifted out to the hight of six feet. Last week about 2,865 car loads of gravel were washed from this mine, which at four dollars a load, a very low average, would yield $11,460 for the week's work. The ground is also prepared for hydraulic next winter, without the aid of gun powder, which has been a very important item in loosening up the high banks of gravel. Manzanita is a dividend paying mine, and will be for years to come."

PLACER.

A VISIT TO THE LINCOLN COAL MINE.—Placer *Herald*, Oct. 2: We paid a visit to this mine last Wednesday. The drifts, cross-cuts, side chutes, etc., for some hundreds of feet from the main shaft, from a perfect network of underground passages. As we passed through these, we noticed on either hand, and at each extremity, beds of glisteuing coal, from four to eight feet in thickness. In some places the coal seemed to almost pinch out, or, in other words, to become so soft and badly mixed with clay as to be comparatively worthless. These streaks, though, we understand, are small and few. The extreme western drift faces a bed of the best coal yet found in the mine. Indeed, the general average of the coal now being extracted, is much superior to any taken out during the early history of the mine, a feature very encouraging to all interested.

QUARTZ AT GOLD HILL.—Gold Hill, in this county, was once one of the liveliest mining camps in the State; but, like many other places which depended entirely on surface diggings, it has gone down, until one store, still kept by one of its oldest settlers, Thatcher Ross, and a few scattering dwellings, are all that remains to tell the story of its departed greatness. But, with pleasure, we record the fact which seems plainly to indicate that this town, if town we may call it, has reached its lowest level. A new interest, of a character rather unexpected, has recently obtained a foothold there, which now bids fair to prove rather extensive, and eventually do much to rejuvenate this historic town. We refer to the quartz interests. For some time several quartz mines in that vicinity have been tinkered with more or less, but for want of capital by the owners, have never been worked down to a paying base. Several of these leads, viz.: The Quadrille, the Pine Top, the Colter, the Phœnix and the Bantam, have recently been purchased by a company of San Francisco capitalists. They have consolidated the whole, under the name of the Quadrille consolidated mill and mining company, and with a large force of experienced miners, under the superintendcy of Thomas McGlew, are sinking on the different ledges, intending to prospect them thoroughly, and work the ores for all they contain; and that they contain precious metals in paying quantities, seems an established fact. Assays of the ore from the Quadrille shaft have been obtained, which reach from $300 to $700 per ton. With the purchase of the mines, the company obtained an old five-stamp mill, which they intend moving to a more favorable site, and adding another battery of five more stamps. They also contemplate the erection of chloriniziug works at an early day, by which they hope to save from 85 to 95 per cent. of metals contained in the ores. The company, we are assured, have money, and every move shows they mean business. We hope they will meet with success equal to their brightest anticipations.

SANTA CRUZ.

GOLD IN THE SAN LORENZO.—*Sentinel*, Oct. 2: It has long been known that gold in considerable quantities existed in Santa Cruz county, notably on the San Lorenzo river, a few miles from town; but up to this time the deposits never have been found rich enough to pay wages for washing. During the progress of the grading on the Felton railroad a heavy deposit of auriferous gravel, with all the appearances of pay dirt, was cut through in making the roadbed, this side of Felton; and Mr. Silent informs us that it was with much difficulty that he was able to retain the Chinese force at work on the road, as they asserted that they could make better wages mining than they could in the employ of the railroad company. Within a few days it has been ascertained that a man has been quietly mining in the same vicinity for many months, earning, with his rude and primitive appliances for saving the gold, $3 or $4 per day. He has been plodding along quietly, keeping his own counsel, and making money all the time. Within a few days a quartz ledge has also been discovered, which it is said can be traced for a mile. Mr. Treat informs us that he saw a piece of the rock pounded up and washed out that contained gold in considerable quantities. We examined several specimens of ore from the same ledge, and have no hesitation in saying that it resembles gold bearing quartz. So that it would not be surprising if in addition to all our other resources a large force of men would be successfully mining for gold at our very doors, as it were.

SISKIYOU.

MINING ON THE KLAMATH.—Yreka *Union*, Sept. 25: From John O. Harrison, who came over from the mining section on the Klamath river on Thursday, we learn that the prospects of the claims in this section are very flattering, and that considerable money is now being taken out. The Enterprise, a bar claim, and the farthest up the river that is being worked at present, got down to the pay dirt on Tuesday, and have got excellent prospects. They will wash up for the first time to-day. Jackson's claim just below them, also a bar claim, has been paying $5 a day to the hand for some time past. Stewart & Co.'s claim in the river has not yielded much as yet, but they get some splendid prospects. The claim of Keonedy & Gregory next below Stewart & Co., also a river claim, has not paid, and we understand the company abandoned it once, but have gone to work again, and have since got a prospect. In Little & Swan's claim a good prospect was found last Saturday. Kleaver & Co. are now taking out money in paying quantities. This company put a wing dam in the river at the commencement of the season, but failed to find any of the glittering metal. They then went back to their bar claim which paid so well last season, and again found good pay. Next below this claim is what is called the "long wing," which is a wing dam over 1,100 ft long put in the river by 4 companies combined. The first of the companies, Love & Co., have not succeeded in getting pay as yet, though they have undoubtedly got a good claim. The others, Dusel & Wiley, Ship & Co. and Smith & Co., are paying very well. Beyond these are several other claims, among them Pullen & Co. and Jeff Romaine's, which are paying very well. Taken altogether, although some of the claims have not paid as well as was expected, the present season, by the time the river rises, will be found to have been a very successful one for the miners on this river.

SAN LUIS OBISPO.

ALMADEN CON.—*Tribune*, Oct. 2: Maboney quicksilver mine has been reorganized under the name of the Almaden Consolidated mining company. From Mr. N. S. Hoffer, superintendent of the mine, who visited us a few days since, we learn that the company is making fine progress in developing its property. They have two large furnaces nearly completed. One of them of 15 tons capacity will be started up the first of this month, and the other a 45 ton furnace, by the middle of November. They have been running a little concern of only a ton and a half capacity for the last few months, and have averaged 20 flasks per month. This has paid the expenses of the mine. With several thousand tons of ore on the dump, and a large amount in sight, the company was justified in their present heavy outlay. This valuable property is near the Lockhart mine. It would seem that the quicksilver deposits in this county are without limit.

Nevada.

WASHOE DISTRICT.

CON. VIRGINIA.—Gold Hill *News*, Sept. 30: Daily yield, 650 tons of ore. The ore breasts are looking splendidly throughout the entire mine, the ventilation first-class, and everything working to as near perfection as it is possible for it to do in such extensive operations. The bullion yield for the present month will reach between $1,700,000 and $1,800,000, which needs no comment, as the amount speaks for itself. The up raise in the ore body over cross-cut No. 2 on the 1400-ft level has been connected with the 1300-ft level, and proves the ore body in the southeast portion of the mine to be much better than was expected. The new pump at the C. & C. shaft was started up last Monday and works splendidly. Sinking the shaft has been resumed. The new building is covered in and will now soon be completed.

OVERMAN.—The prospecting drifts on the 900-ft level are steadily advancing without change of interest to report. The south drift from the bottom of the winze on the 1100-ft level is steadily pushed ahead without change of value to record. More of a delay has been experienced in getting the new spur wheel from the foundry than was at first expected, owing to a lack of a sufficient quantity of metal from which to manufacture it. The wheel is now on the way from San Francisco, and everything will soon be again in good running order. The water is rising but very little in the shaft, showing conclusively that the strong head recently encountered has been exhausted, so that no great trouble from that quarter need again be expected.

SIERRA NEVADA.—Sinking the new shaft goes steadily forward at a fair rate of progess. The rock in the bottom is a little hard but blasts out well. The main west drift is being rapidly advanced toward the ore vein by aid of the new drills. The drills are of the English (Ingersol) patent, being the only drills of that make on the lode, and are being closely watched by the drilling experts along the entire line. So far as yet tried, they are fully the equal, if not superior, of the best American patents, and show great merit wherever and in whatever character of rock they have been tested. The north and south drifts on the 700-ft level of the old shaft are steadily advancing in ledge material, without change of interest to record.

CALIFORNIA.—The machinery of the new mill is nearly all on the ground and both the reduction and amalgamating mills are being pushed to completion with all the energy possible. The winze below the 1560-ft level is down 69 ft, the bottom still in rich ore. Timbering the cross-cuts and drift on the 1550-ft level is making excellent headway. The north drift on the 1400-ft level has passed through the poor streak recently cut and the face is again in fine ore. It is now in 285 ft from cross-cut No. 3, the place of starting. An unprise has been made from this drift which is now up 64 ft in low grade ore.

JUSTICE.—Drifting and cross-cutting in the old south mine, or Waller Defeat section, goes energetically ahead, and a splendid body of ore is being developed at the 600-ft level, considerable of which is high grade. At the 800-ft level the south drift is now running in quartz and vein matter of a highly promising character.

LADY WASHINGTON.—All the machinery has arrived and nearly all is placed in working position. The large new pump is also nearly all in place, and the works will be ready to start up at an early day, when sinking the shaft will be resumed, as soon as the balance of the water can be pumped out. As is well known, the indications found at the bottom, before the huge flow of water was tapped, were of the most flattering character, and the prospects are that a very acceptable bonanza of ore will be developed in the Lady Washington as soon as the massive new machinery can be effectively brought to bear in the case.

OPHIR.—Daily yield, 300 tons of ore. This increase of ore production has been made to furnish a supply of ore for 2 additional mills, the Pacific and Kelsy, which started up on the Ophir ore the 1st of October. These 2 mills have a crushing capacity of 150 tons per day, and will add greatly to the bullion production of the mine. The Ophir is steadily verging on toward a return to her old dividend-paying rank, and may yet astonish some of the bears and doubters. Work is progressing well and favorably at all points in the mine.

SILVER CENTRAL CON.—This valuable mining location, near Silver City, is now coming into prominent notice through more active and efficient development than ever. The company have recently been putting up first-class steam hoisting works, and the machinery was started up for the first time yesterday. It operates smoothly and good as could be desired. Work is resumed in the mine itself to-day. The shaft is 175 ft in depth, at which point a station is to be opened for a drift to the ledge.

ROCK ISLAND.—Putting in the new pump station at the 650-ft level, is making excellent progress. On the 450-ft level the ore vein has been cross-cut for a distance of 210 ft without yet reaching the west wall. Of this distance 88 ft passed through a solid ledge of quartz of a fine character with many encouraging prospects of ore; and the remainder through a broken, mixed body of quartz, clay, and porphyry. The main north drift on the 450-ft level has been extended into the Pacific company's ground where the ledge is looking very promising.

JULIA.—The shaft is down 1500 ft, the bottom in good working ground, and the sinking making splendid progress. The southwest prospecting drift, on the 1400-ft level is rapidly advancing, with strong evidences of soon reaching the vicinity of the main ore vein. The prospects in this drift are very favorable. The main south drift on the 1000-ft level is steadily advancing, the face in very interesting ledge matter, and with still better prospects ahead.

CALEDONIA.—Work in the old incline shaft has been suspended for the present, as great a depth having been reached as it is profitable to continue the work until connection with the new shaft is completed. The new shaft is down 500 ft, and two pump stations are being put in, one at the 300-ft level and the other at a depth of 505 ft. As soon as these stations are completed, sinking the shaft will be resumed. Everything in and about the mine is working splendidly.

UTAH.—A strong flow of water is still encountered at the bottom of the shaft, which, however, is easily handled by the powerful pumps. The shaft is now down 165 ft below the 400-ft level, the sinking making steady and favorable progress. But a small amount of work is being done on the 400-ft level, as the energies of mine are concentrated in forwarding the shaft work, so as to open a new level 200 ft below the 400-ft at the earliest moment possible.

IMPERIAL.—The extraction of ore is progressing as usual, the mill giving good returns. The ore body appears to be gradually widening, and the prospects of the mine generally, are on the increase. Daily yield, 40 tons of ore, the assay value of which, ranges from $60 to $100 per ton. No new or important changes or developments to chronicle in any of the prospecting drifts on the lower levels.

IOWA.—The upper tunnel running west under

the croppings, is making steady progress, still opening up large masses of fine looking quartz, but as yet finding no ore that will pay for milling. The west drift on the 400-ft level is steadily advancing, the face still in favorable ledge matter, and occasionally encountering streaks and stringers of rich ore. The prospects of this drift are quite favorable.

New York.—Placing the powerful new machinery is fast nearing a successful completion, and the superintendent thinks it will be ready to start into full working operation about a week from next Saturday. After clearing the shaft of water, which will take a couple of weeks, sinking will be resumed to develop the excellent ore prospects found at and near the bottom of the shaft.

North Con. Virginia.—Sinking the shaft is making splendid progress, five feet and a set of new timbers being added to the shaft every other day. The bottom still in soft ledge matter of a very encouraging character. The erection of the new machinery now places the North Consolidated Virginia on a first-class working basis.

Leo.—Still making good progress in driving the main north drift; it is in 77 ft from the bottom of the winze to-day. The material in the face is becoming softer, and shows considerable improvement in character; more quartz is coming in and it is of better quality, some of it being highly charged with sulphurets. No increase of water since last report.

Bullion.—Sinking the main incline goes steadily ahead, the rock working well and the retimbering making good progress. The north drift on the 1700-ft level is steadily advancing, the face in very promising quartz and ledge matter. Work in the north drift on the 2000-ft level of the Imperial progressing as usual.

Chollar.—Daily yield, 50 tons of ore. There is no change of value in either of the south prospecting drifts on the 1150, 1250 or 1350-ft levels. Sinking the new shaft is going steadily ahead, the rock in the bottom blasting out well. The new building is about completed. Good progress is being made at all points.

Crown Point.—Work progressing well at all the points as usual. No new discoveries to report of the prospecting operations on the 1000 and 1700-ft levels. The machinery is all working well, and the present prospects are quite favorable for good developments.

Belcher.—The improvements and repairs are making rapid progress, and the prospects are that everything will be in readiness to start the entire mine into full operation by about the second day of October. No changes, whatever, of value to report.

Yellow Jacket.—The south winze on the 1740-ft level is down 360 ft to-day, the bottom still in dry working ground. The north winze on the same level is down 303 ft, also dry. There is no change to note of the cross cuts on this level. The water in the incline remains about the same.

Amazon & Glasgow.—Sinking the joint shaft is making the usual good progress. It is now down 92 ft below the first station, the rock blasting out well. Stringers of quartz and ore of an excellent character are frequently met with. Another station will be opened at a depth of 100 ft below the first, and a drift started to cross-cut and prospect the ore vein, which will give a total depth of 309 ft from the surface. The machinery is working well, and the prospects are certainly very promising.

Florida.—The main drift west is progressing into the ledge matter, it having been well timbered and secured against further caving. Considerable water flows from the face, and some very good assays are obtained from stringers of quartz passed through. The main ledge itself is evidently close at hand.

Globe Cons.—The main drift tunnel is being steadily advanced, with a very favorable indication of soon reaching the ledge. On the 350-ft level the ore vein is opening up finely, with every prospect of yet developing good paying bodies of ore. The grading for the new machinery is about completed.

Hale & Norcross.—Cross-cutting and prospecting the 2100-ft level is still prosecuted with great vigor. While there are many favorable features in the quartz and ledge development on this level, no extensive paying bodies of ore have yet been developed. Work progressing well at all points.

Savage.—Sinking the main incline is making the usual headway. The north prospecting drifts on the 2100 and 2200-ft levels show no particular changes during the week. No change to report of the south winze below the 2200-ft level.

Gould & Curry.—Retimbering the tenth station and the main incline below that station is making all the progress possible. It is now hoped that everything will be in readiness to commence cross-cutting and the thorough prospecting of the 1700-ft level in a very short time.

Union Con.—The streaks of quartz and ore in the face of the north drift on the 1300-ft level are looking much more favorable for a good development at no very distant day. Sinking the winze on the same level is making good progress.

Buckeye.—Sinking the shaft was resumed last Tuesday morning, and is being again vigorously prosecuted. The new and powerful hoisting machinery now enables the working of the mine to a much better advantage than ever before.

Sutro Tunnel.—The vein matter in the face of the header is somewhat harder, and therefore more easily managed than it was last week, allowing of better work being done and faster progress. Total length of tunnel to-day, 11,044 feet.

West Belcher.—The main tunnel is steadily advancing, the rock in the face working well. The ore indications are excellent, and everything is fast putting on a very encouraging look for the stockholders.

South Comstock.—The indications at the face of the cross-cut at present show close proximity to the main west ore vein. No water to contend with, that being drained by the deeper mines of that vicinity.

Knickerbocker.—Some necessary repairs are being made to the pumping engines. As soon as completed, draining the water from the shaft and work in the mine will be resumed.

Europa.—The station at the 320-ft level is nearly completed, and sinking the shaft resumed. Everything is working splendidly and the prospects of the mine never were better.

Cosmopolitan.—The face of the main tunnel, as well as the other points of ore development in the mine, are showing well, and the prospecting work is pushing forward lively.

Sutro.—The rock in the face of the main west tunnel is softer and admits of much better progress than for some time past. The flow of water is still on the increase.

Senator.—The water nearly drained from the 400 ft level. It is the intention to commence cross-cutting the ledge from the south drift as soon as the water will admit.

Mint.—The shaft is down 850 ft, the bottom in ledge matter of a very encouraging character. The flow of water is slight and good progress is being made.

Succor.—The main west drift on the 550-ft level is steadily advancing, the face in soft ledge matter, with streaks of very favorable quartz and ore coming in.

Best & Belcher.—The face of the north drift on the 1700-ft level is still in hard blasting rock. The repairing of the main drift on this level is completed.

Lady Bryan.—Sinking the main shaft and driving the north and south drifts on the 380-ft level as usual, with no new features or developments to note.

Original Gold Hill.—The ore developments in the southern portion of the mine are showing finely and promising better, showing continual improvement.

Baltimore and American Flat.—The main incline is being sunk with all the energy possible, the bottom in good blasting ground, the best of progress being made.

Mexican.—There is no change in the character of the quartz in the bottom of the winze below the 1465-ft level. Sinking progressing as usual.

Pictou.—The rock in the main shaft is softer and looser than last week. No increase of water.

Wells Fargo.—Sinking the shaft as usual, with no new features to report.

Nevada.—The ore body developed by the cross-cut at the lower level is of low grade, yet shows continued improvement as the work progresses.

Prospect.—Shaft sinking in very favorable material at present. Tunnel shows no material change.

Woodville Consolidated.—Work on the new pumps is rapidly advancing. A drift is being run to connect the old works and the new shaft.

Sullivan. — Shaft making excellent progress downward, with a full force of men both at that and the surface grading.

Silver Hill.—The cross-cuts and drifts at the third station level are still progressing without change of value to chronicle.

Leviathan.—The face of the drift at the 420-ft level is in splendid looking quartz, some of which assays very well.

North Chipman.—Shaft down 62 ft to-day. The bottom is in good sinking ground. Everything going ahead finely.

Moore & Monoan.—Good assays continue to be obtained from the vein matter passed through in sinking the shaft.

Dayton.—The new pump engine is working splendidly, and sinking the shaft will be resumed to-morrow.

Idaho.

The Oro Fino.—Owyhee *Avalanche*, Oct. 1: Some choice rock was taken from the first level of the Oro Fino yesterday, on the north side of the shaft. On the same side of the shaft, 40 ft further down, there are indications of similar rich developments. A winze is being sunk from the second to the third levels south, and from both the lower level and the winze some good milling ore has recently been taken out. The ore from the first level is the continuation of a rich vein, which existed in the old Oro Fino, and that from the second level is regarded as even superior in quality to that which has recently been taken from the first level. Fifty-eight tons of ore were shipped from the mine on Thursday. Three quartz teams are constantly employed, and the Golden Cheriot and South Chariot mills are running day and night on Oro Fino ore. Seventy men are employed in and about the mine. Altogether, the Oro Fino is making very encouraging progress. It is only a little more than four months since the work on this mine were commenced, and taking into consideration the splendid character of these works, the recent rich developments and the active and successful operations that are in progress, it is a subject of general congratulation, and superintendent Catalow and others interested will at no distant day reap the reward of their energy and enterprise. Among the recent improvements completed are new blacksmith and carpenter shops, also a spacious and well arranged office, comprising in all a model establishment and a thoroughly equipped mine.

Golden Chariot.—There are fifteen carpenters at work on the frame of the new building at the Golden Chariot, and the works are making rapid progress. The new structure is being erected directly over the old one, which is to be torn down. The best quality of timber is being used throughout, and the structure bids fair to be a most solid and substantial one throughout. All the machinery except the mining gear is on the ground. The engines are as large as those used at the Comstock mines, and the boilers and other appertenances are in keeping with the general solid character of the iron material used, which will make the works of the Golden Chariot, the most substantial and commodious of any to be found in this section of the country. The mine is looking well, and the rich ore recently taken from the second and ninth levels affords a cheering hope for the future of the mine. Only a limited quantity of rock is being taken out at present. There are about 50 men employed at the mine, most of whom are engaged on the new works.

Silver Cord.—Stoping has been going on for the past few weeks at the Silver Cord, and there are now about 70 tons of assorted ore in the ore house. It will probably be a few weeks before the new machinery will be ready for active operations. The new boiler is in position on a first-class foundation, and steam pumps will soon be erected to take the water out of the mine. The timbers for the gallows frame, engine bed and reel blocks, are all ready for the machinery, and the Silver Cord will soon present a new visage. Externally many improvements have been recently inaugurated. A new blacksmith shop has been built, and the old one has been converted into a carpenter shop. Several carpenters are at work on the old shaft house, which is to be converted into a boarding house, and when completed, the present eating establishment will be turned into a sleeping house. Several new roads have recently been built in the vicinity of the mine, which will greatly facilitate the transportation of ore and material. The Silver Cord boys are in a happy frame of mind just now, and the prospects of the mine doing a good business for the fall and winter are very encouraging.

The Blazing Star is the name of a little mine not far from the Minnesota, where the patriarchal Cris. Kelsow is operating, and where he intends to "stick" until he strikes it. He is laboring energetically in the sinking of the shaft, which is now down 50 ft, and his labors thus far have been rewarded by the appearance of many rich streaks of the precious metal in the rock which is being taken out. The "old man" is full of hope, and pronounces it the best thing his eye has met for the last quarter of a century. At a depth of 80 ft he intends to cross-cut. The assays thus far are very favorable. The rock is similar in appearence to that which was met in the early days of the Golden Chariot. It shows considerable antimony, and bears evidence of richness, which increases as the shaft goes down. The owners will cross-cut at a depth of 80 ft, and something pertaining to the character of the ledge, which is quite large, will soon be more definitely known. The claim was located in 1865. It has been worked since the 10th of August by Messrs. Kelsow and Blackinger. The former will soon build a house on the ground, and remain for the winter on the spot where his hopes for the future are centered.

Empire.—The rich strike just reported in the Empire turns out, according to all accounts, to be a *bona fide* and magnificent development. A sample of the rock picked up from the ledge, which has just been reached, has all the characteristics of first-class ore. A piece exhibited yesterday at Glover & Co.'s is rich in streaks of gold, and has attracted much attention. It will assay about $6,000, and several parties who have been working in the mine pronounce the ledge the best in the camp. The discovery was made at a depth of 50 ft, where the surplus of water will prevent immediate active operations. The mine has not been worked on a large scale hitherto, there having been at work during the summer six contractors, two bucket tenders, two engineers and one blacksmith. It is hoped that there will be no delay in pushing the work, as the gentlemen interested in the operations are sanguine of success, and believe that the mine has all the elements of richness in it.

Leonard.—The Leonard mill has been in full blast for several days, and works splendidly. It has 5 stamps and a capacity of 15 tons per day, which is equivalent to the work of an ordinary 10-stamp mill. All the machinery is new and is of the very best description, giving promise of doing the most satisfactory work. A considerable quantity of rock has already been crushed, consisting of 3 lots from the War Eagle mountain, about 60 tons from the Florida mountain, and 1 or 2 lots from Wagontown. The mill is now working on ore from the Elmira, and when this is finished a lot of Pauper ore will be crushed, to be followed by the Poorman ore, of which there are several hundred tons at the mill. There is a force of 10 men employed at the mill, which is kept going night and day. It is in complete running order and is regarded as one of the most compact and best arranged establishments of the kind in the country. Mr. Leonard has also the supervision of operations at the Golden Chariot mill.

Mahogany.—About 70 men are at work in and about the Mahogany. We were shown yesterday by Mr. Thomas, foreman of the mine, 2 large samples of rich rock weighing about 15 pounds each, taken from the 9th level south, and at a distance of nearly 600 ft from the shaft. Mr. Thomas says it is the best rock he has ever seen taken from the mine, and the indications are that there is plenty of it. The ledge is about 2 ft wide and is a continuation of the rich ore shute south, that yielded so favorably some months ago. There are well defined streaks of gold and silver in the new development, and no better looking rock has come from any part of War Eagle mountain. There are about 220 tons of ore at the mine ready for shipment, and as soon as certain questions pertaining to the welfare of the mine are settled, the work of crushing the rock at one of the mills, probably the Ellmore, and the shipment of bullion will go forward without delay.

Poorman.—At the Poorman, active operations are being made for stoping, several timbermen having been employed during the past few weeks. The shipment of ore from the mine will soon be commenced on a larger scale than usual. There is now a large quantity of ore at the Lenoard mill awaiting crushing. This has been mainly taken out of the tunnels. Active work will be begun on the new quartz hoist next week and there will be lively operations at the Poorman before the expiration of many weeks.

Pauper.—The Pauper is looking well, and the developments generally continue to be quite favorable. Mr. Carey, formerly of the Red Jacket, is now foreman of the Pauper.

Illinois Central.—At the Illinois Central work is going actively forward as usual. Abundance of good ore has been met recently, and Supt. Linkton is endeavoring to have a larger quantity crushed. The Cosmos has been running on Illinois Central ore for several weeks.

Ida Ellmore.—Cross-cutting is still in progress at the Ida Ellmore. A considerable quantity of ore has been taken out the past week, and most of it is of a superior quality. Preparations are being made to work the mine on a larger scale; a larger force will be employed early in October, and the quartz on hand will be forwarded to the mill and crushed.

War Eagle.—There is no change to report in the status of operations at the War Eagle mine. A small force is employed there and impression is generally that the mine is capable of doing a good business for its owners.

South Chariot.—The ore which is being taken from the 7th and 9th levels of the South Cheriot is looking first rate. The mill commenced crushing it yesterday, and a favorable return is expected therefrom. There are about 25 men at work at the mine, and a promising fall business is anticipated.

Elmira.—At the Elmira the drift is being run south, and the complexion of the ledge is very encouraging as far as examined.

Wire Work.

For garden seats and arbors where rustic wood work would be inappropriate, those of metel or wire work will be found of the greatest value. Messrs. Eckfeldt & Co., of Clay street, in their large compartment for the display of their manufactures at the Fair, on the right, before entering the garden, produce some fine examples of artistic wire work, in a splendidly ornamented and graceful summer house, plant stands, settees, chairs, and a multitude of other both useful and ornamental articles. Many of these are of almost incomparable beauty in design and workmanship. The pliant nature of the metal they employ is most favorable for the elegant traceries, waving lines and light flowing scrolls which adorn these admirable pieces of furniture. Perhaps, in addition to the forms presented in this fine display, we may be excused in suggesting to this enterprising firm, that some of the most useful of all the metal embellishments for gardens, are arches and canopies of wire work for spanning paths or as affording proper sites for the growth of a variety of elegant climbers. There can be nothing cheaper or more durable, while the gracefulness of these ornaments, when covered with fine climbing masses of *Stauntonia*, or the verdurous tendrils of *Astrolobium niphon*, or even common ivy, is unmatched. The canopies are suitable for plants of less rapid growth, and are in themselves elegant structures, though, of course, still more so when skilfully covered with the tendrils and blossoms of suitable plants. We strongly recommend these useful and beautiful structures to all lovers of elegance in gardening. Trellises and wire work of such light character as wire affords, are very appropriate for such climbers as *Passiflora rhodochiton*, *Cobœa scandens*, the tuberoses, *Tropœoleum*, manraadeas and fuchsias of pendant habit. Trellises fitted to pots, and covered with climbers, make noble window and terrace ornaments.

Two of Wells, Fargo & Co.'s treasure boxes were cleaned out yesterday and the day before in different sections of the State.

The famous trotting mare American Girl fell dead on the track at Elmira, New York, last Saturday. She left a record of 2:17.

All kinds of building is going very briskly in Antioch.

Reports from the national banks are called for.

Galvano-Plastic and Bronze Work.

A very curious collection of galvano-plastic, bronze, gold and silver plating work, may be seen in the Art Gallery at the Mechanics' Fair. One case contains a number of strange looking molds and patterns, and another has a number of statuettes, medallions, figures, etc. Within the railing are shown several ornamental grates, large massive candelabra, bronzes, etc. The articles are unique and many of them are real works of art.

The display is that of R. F. Rochicioli, who has been in business in this city since 1858. He has every facility for conducting the various departments of his establishment, which embraces a considerable range. He manufactures bronze figures, imitation bronze figures, chandeliers and ornamented gold and silver plated work, material for military companies, etc. He also makes seals, stamps, galvano-plastic work, and, in fact, everything in this line. His principal trade lies in the direction of ornamental work for furniture, grates, frames, etc., although he does some very fine bronze work. Some of the large bronze figures exhibited by him are very elegant, and few people imagine that they are made in San Francisco, as they look like French or English goods.

Mr. Rochicioli is the only one here who has turned his attention in this direction. Of late years, since the population has become richer and more permanent, the demand for these ornamental goods has become greater, and considerable work of this character is done to order.

Bronze figures, for instance, either for ornaments or gas lights, can be made in any style or size. He makes his own molds or patterns, so that if any one desires a certain design, by simply furnishing a drawing or sketch the subject can be worked up in metal. The process of casting these bronze figures is quite simple in itself, although the details are difficult to carry out. After the design is selected a model is made by hand in clay or wax, and from this a plaster of paris mold is made. If only a plain pattern a brass mold is easily made from this plaster one, from which to cast similar patterns. But in the case of bronze figures like the figure of a woman with arms outstretched, a man on horseback, or anything of a similar complex nature, the figure could not be taken from the mold without destroying the latter. To remedy this, when the plaster mold is made it is cut in pieces or sections, and another mold cast around them. Each of these sections in plaster is then cast in brass. All these pieces fit together closely and form the mold from which the figure is made. By examining the case in the display, a number of molds, finished and unfinished, will be seen. Of course each piece must be carefully finished up. It will be seen from this that after the molds are all made the work is comparatively easy. Several very handsome bronze figures made in this manner are exhibited by Mr. Rochicioli. Two of "Tancred" and "Florinda," on horseback, are especially fine. Another of "Agriculture" is a well made piece.

When they come from the cast they are, of course, rough, and have to be finished up by chasing. Some of the molds mentioned have from thirty to fifty sections in them.

The galvano-plastic work, another specialty of this exhibition, is curious and interesting. It is a process of reproducing medallions, etc., on a large or small scale, or reproducing busts or figures in basso relievo. A great deal of ornamental work is done by this process, which is not generally well understood. In the eighteenth century two distinguished scientists, Galvani and Volta, revealed to the world the wonderful effects of a power unknown until then. From this discovery the voltaic and galvanic piles are named, which in later times have had so many wonderful applications. Galvano-plastic and electrotyping work are two discoveries resultant from these.

To make a bust, for instance, by the galvano-plastic art, the process is different from that of casting. A model is made in the usual way; then gutta percha, prepared for the purpose, is pressed around the model in such a way as to receive an exact counterpart. The gutta percha is then split down one side, so as to get the model out. It is fastened together again and the seam smoothed over. The inner surface is then coated with plumbago or nitrate of silver, and it is placed in a solution of copper. The positive and negative poles of a galvanic battery are then admitted to the solution, the positive touching the mold, and the copper is precipitated on the surface of the mold, giving an exact counterpart of it. The longer it is left in the bath the thicker it becomes, so that articles can be made of any desired thickness. When removed the gutta percha is taken off and the medallion, bust, or other article is in metallic form. It can then be silver or gold plated, or bronzed, as desired.

Mr. Rochicioli shows a number of specimens of his skill in this line, some for ornament and some for use. Among the latter are a number of plates for stamping leather for Mexican saddles, for book binders, etc. The molds for these being flat, could be made of leather, paper, or plaster of Paris, coated with plumbago. The exact impression of the original is of course taken. These latter patterns are a quarter of an inch thick and of pure copper. Of course any figure or article can be made by this process, and if any one has anything they desire duplicating it can now be done here.

A specialty is made by the exhibitor of ornamental work for fire places, grates, etc. He procures rough castings from the furnace and finishes them up smooth, afterwards nickle or silver plating them, or making them up in bronze. He puts on fine trimmings and ornamental work, making the grates have an elegant appearance. A great deal of this work is done in the East, but has only recently been introduced here, although considerable is now done. Most of the grates and mantel-pieces shown in the Pavilion, were ornamented in this manner by Mr. Rochicioli.

He also does considerable ornamental brass work for buildings, etc. He can make up any desired article in this line from drawings, or draw the designs himself. He has a foundry for fine work connected with his works, and makes ornamental castings of all kinds.

This is a home industry of an artistic nature, and one which is gradually increasing its sphere and giving employment now for from ten to twelve men. The churches, military companies, mantel makers, etc., get their ornamental work done here now instead of in the East. The display in the Fair is composed entirely of articles made at Mr. Rochicioli's works. A fine specimen of galvano-plastic work is the large salver in the glass case. It has upon it the Declaration of Independence with signatures, medallions of Washington, Webster and Clay, and a representation of the Congress of 1776. A number of medals, vases, masonic emblems, military ornaments, busts, basso-relievo plates, etc., are shown in the large case. A few plaster figures, over which a coating of copper has been precipitated by galvanic battery, are also shown. This is a good way of preserving large garden stands, fountains, or ornaments exposed to weather, as they can be bronzed after being covered with copper, so to be impervious to moisture. A visit to the works, Nos. 6 and 8 Tyler street, would be of interest to any one, as will be the display, when it is examined understandingly. Mr. Rochicioli has sacrificed a good deal of time and money to establish this business in California, but is now being paid for his work. Artistic work of this nature is now more in demand than formerly, and the demand is sure to increase steadily from this time forward. Home industries of this sort should be fostered and encouraged.

The Decoration of the Main Centennial Building.—Messrs. A. Goth & Co., of Bethlehem, Penn'a., are now engaged in making experiments in decorating the interior of the main Exhibition building with a new preparation of oiled paper which is designed to take the place, to a certain extent, of frescoing. They have decorated a small strip of the side and roof of one of the main spans of the building, and the effect is very pleasing, it being impossible, by simple observation, to distinguish the decoration from fresco painting. The colors are very brilliant and are capable also of being very delicately shaded. The iron columns supporting the superstructure have been covered with blue paper with stripes down the center, which towards the base of the column are relieved with various colors in fancy designs. The wide panels immediately below the sash are covered in blue, and ornamented with designs in blue, red, black and gold, and coats of arms of the States. Above the sash are small, circular windows, which are covered with transparent paper, decorated with emblematical designs representing the Arts. The construction between the column is blue, and the roof is covered with light drab, the rafters being blue, relieved with red and brown. It has not yet been determined whether this method of decorating the building will be adopted. It is claimed that the paper is durable and entirely water-proof, and much cheaper than any method of painting.—*Philadelphia Ledger.*

Camphor Wood.—Attempts have been made during the past twenty or thirty years to introduce camphor wood for various purposes of cabinet making and trunk work; but though it is light, durable, and not liable to injury by insects, its cost keeps it from being in much demand. What has been used is brought mostly from China, but it grows freely in tropical countries, without cultivation, and especially thrives near the sea-coast, where it may be easily obtained for shipment. It attains large proportions, being sometimes found fifteen feet and upwards in diameter, and proportionly high. It has an agreeable, aromatic odor, and, for trunks and boxes, is admirably adapted, but being double the cost of cedar, will not be likely, at present, to supersede that popular wood. It is strong and durable, and may be extensively used for ship-building. Camphor wood piles have been known to remain in a good state of preservation over a century, and it may be successfully applied to all purposes for which teak-wood is used.

Rich.—We yesterday saw a very rich specimen of quartz rock from the ledge of Joseph H. Colt, of Mormon Basin. If the sample brought into our city is anything like a fair sample, he certainly has a bonanza far surpassing anything ever struck in the most noted mines of Nevada. The gold is thick and heavy on the rock we looked at. We congratulate our friend on his rich strike. We would like to have an interest in his mine.—*Bedrock Democrat.*

The Fast Mail Postal Cars.

The fast mail postal cars of the New York Central railroad were built at the shops of the New York Central and Lake Shore roads, and consist of three styles or classes, one for assorting and distributing newspapers, another for letters, and a third, called tenders, for stowing through mail matter. The one for newspaper service is sixty feet in length, nine feet eight inches wide outside of sills, and is mounted on six wheel trucks. The outside, below the letter boards, is painted almost a pure white, the letter boards being a shade darker. In the center is a large oval raised panel bearing the name "Gov. Tilden," and on either side toward the ends, is a shield, one representing the national coat of arms, and the other a design with the Latin inscription, "Novus Ordo Seclorum." The letter car is fifty feet long and runs on four wheel trucks. Each car is lettered "The Fast Mail," and also with the names of the two roads, N. Y. Central and Lake Shore. There are two double doors on each side, and also two of Ward's mail-catchers for receiving mail bags at the various points without stopping the speed of the train. The interior of the "Gov. Tilden" is fitted up with all the necessary facilities for assorting newspaper mail matter. These consist mainly of ninety-four chutes to which the bags are attached. The letter distributing car is fitted up with 946 letter boxes. The platforms are inclosed with side doors, so that there is communication from one car to the other with but little exposure to the wind and weather. The lighting is by student lamps. The letter distributing car is named "Gov Dix," and has the same ornamental features and general outside appearance as the "Gov. Tilden." The tender cars to which we have referred, are all fifty feet long and painted pure white, except the frezes which are a trifle darker. They also have four wheel trucks. There are no inside fixtures except a double row of stanchions extending from roof to floor, and six candle burners suspended from center of dome. The side lights are wider than usual, and are continuous, without division panels, for the purpose of admitting as much light as possible. — *National Car Builder.*

The Suggestiveness of Smells.

The great practical object of the sense of smell is, doubtless, in man as in other animals, to assist in the choice of food. In this it acts preliminary to the organ of taste; and there exists a natural sympathy between the two organs. Besides this practical employment of the sense, it affords to a man a refined and delicate, and not over-obtrusive enjoyment; silently, and perhaps unobserved, enabling him to stamp an additional character of sweetness upon what is lovely in form and color; and, fortunately, the beautiful in scenery is generally allied with what pleases and gratifies this sense. The mountains of Switzerland we associate with the flavor which the sun exhales from her pine forests. The banks of Tweed's "silvery stream, glittering in the sunny beam," are ever in our minds seasoned with the odor of the whin blossom, among which, in boyhood, we searched for the linnet's nest. A single puff of peat-reek will make the man of business, immured in his counting house, stop his pen that he may muse on the seclusion of the highland glen. Many persons find the suggestive powers of odors greatly superior to those even of vision; the reason may be, that whereas vision at once reveals its object, and in the act satisfies our intelligence, the sensation of scent is generally anticipative, the mind is for a time in a suspicion of suspense, dwelling on the sensation, and busied predicating the cause; the impression thus becomes vivid and indelible. Thus every country and every large city we visit has the distinct savor interwoven with its other wonders into the mind, and which, like a mysterious and invisible genius, hovers over it. The coal smoke of London fills the nostrils of the visitor, and never leaves them; the damp, greasy flavor of the narrow streets of Paris, the turfy smell of Holland, and the putrid effluvia of Constantinople, give a smack and character to each place which is not easily forgotten.—"*The Physics and Philosophy of the Senses,*" *by R. S. Wyld.*

American Street Cars For Russia.—The shops of John Stephenson & Co., in New York, have recently completed and shipped several cars for the St. Petershurg tramway company, of St. Peterebnrg, Russia. That company has also ordered several cars from English and Belgian makers, which are to be used in competition with the American cars, and the final contract for a large number of cars will be given to the maker whose work proves most satisfactory. The cars are somewhat different from those in use in this country, being arranged for twenty-two seats inside, and the same number on the top. The length of the cars is twenty-six feet. As no passenger will be allowed to stand, the cars, when loaded can be drawn by two horses. The roofs are curved, and the seats on the top are reached by stairways at each end of the car. The empty cars weigh about 4,650 pounds and cost, at schedule prices, $1,125 each.

The Imperial mine, at Gold Hill, has begun to turn out bullion. The Douglas mill began crushing ore on the 16th instant, and $8,000 of bullion had been turned out several days ago. The monthly clean-up will probably show a respectable row of figures.

Ice Machines.

Ice is a luxury which few families can indulge in at the prices at which it is generally sold in the cities. During the warm weather people of course feel the want of it, and it is then that it brings the highest prices. It is only of late years that artificial ice, or rather ice formed by machines, has been in use; but generally these machines are so bulky and expensive that their use by families is prevented. Now, however, small machines are made, by which a few pounds of ice can be made.

A machine of this kind can be seen at the Mechanics' Fair, under the stairway of the machinery department. It is manufactured in Paris and exhibited by John Hahn, of 502 Montgomery street, sole agent for the Pacific coast. It is used either to make in ice, ice cream or as a champagne freezer. As few persons understand the *modus operandi* of making ice, some little description of this machine may not be out of place.

The refrigerator is placed in a tub of cold water, with about three-quarters of an inch of water above it. The boiler is then put on the stove and its contents heated until the thermometer attached indicates 130° cent. The refrigerator is then taken out of the tub, and the water allowed to run out at a compartment, and the hole in its lower part is stopped up. The boiler is then put in the tub (the cork being taken out) so as to have it plunge in the water about three-quarters of its hight. Whatever it is desired to freeze is then put in the cylinder and placed in the cistern. The empty space between the cylinder and cistern is then filled with alcohol or brandy. As soon as the refrigerator is wrapped up in a dry flannel or blanket the freezing goes on without further manipulation. The alcohol may be used over and over again. The ice may be detached from the vase by dipping it in water.

The cold is produced from these reasons: The boiler is full of concentrated ammonia, which is everlasting. During the time the heat is applied the ammoniacal gas escapes and passes into a liquid form in the refrigerator. During the freezing the gas forms again and returns to the boiler. It is sufficient to have the water in the tub changed once or twice during the operation to make this second transformation, which produces enough cold to freeze the liquid in the refrigerator.

The machine, when working, must neither be moved or leaned over to any great extent. Whenever the machine has been subject to much disturbance, or when being transported from one place to another, it should be set in one position for at least an hour before using, so that none of the solution may remain in the refrigerator. The latter is then plunged into a bucket of warm water, for almost fifteen minutes, and then placed in its proper position. A funnel is placed in the tub in such a way as to conduct the cold water to the bottom, whilst the warm water escapes by a hole near the surface. In every case the cooler the water the better.

The temperature, 130 degrees, indicated for the heating, is sufficient when the water in the tub is at the ordinary degree of temperature of well water—that is 12 degrees centigrade. If this degree is higher the heating will have to be stronger. For instance, if the water in the tub is at 25 degrees the heating would have to be carried up to 150 degrees.

The length of time required for heating a machine, such as we have described, with a capacity of ten pounds, is fifty-five minutes. One hour and a half is required for a four pound machine. The same time is required for freezing. These little machines may be examined in detail, at the Fair, by those interested.

An Assayer's Paradise.—The *Mining Review*, of Georgetown, Colorado, has the following: Boulder county is the assayer's paradise. Not only can the diligent chemist find ores in plenty upon which to test his skill, but we doubt if there is a piece of rock in the entire county that would not consider itself a disgrace to its paternity if it did not go at least 1,000 ounces, while the vast majority of bedrock and pebbles from the plains to the range, are capable of soaring up to five or ten thousand, without boasting in the least of the feat. And even if an unfortunate piece of granite finds itself lying around loose without a chunk of native silver or virgin gold, or a seam of ruby or glance attached, it never is happy until it has squared things by forming a close acquaintance with a piece of tellurium or bismuth, or some other wonderful and rare element. We reflect, with envy, how frequently the native assayer, there, must be forced to gather up his big assay buttons, melt them into a gold and silver brick, express them to Denver in his valise, and then follow to spend a few jolly days in the metropolis.

The Brunswick mill, on the Carson river, has been purchased by the Consolidated Virginia mining company, and in a few days will be started up on ore from the Consolidated Virginia mine. This mill has fifty-six stamps, twenty-six pans and thirteen settlers. The motive power is water, with a Leffel turbine of fifty-six inches. The mill is capable of crushing 170 tons of ore per day. This mill will now be run upon Consolidated Virginia ore, and shipments have already been commenced. This will add about $500,000 per month to the crushing capacity of the company.

Useful Information.

A Novel and Startling Proposition.

The *Scientific American* proposes a new and somewhat startling substitute for hanging, and some of the minor forms of punishment. We quote from that paper, as follows:

Our suggestion would therefore be that such a portion of the criminals convicted from day to day, as might be found available, should be turned over to boards of surgeons and physicians, duly appointed, under whom they might be used for the investigation of sanitary problems, for the good of humanity.

For example, men convicted of capital crimes, instead of being uselessly hanged, might be employed in the study of diseases usually fatal, or of other diseases whose effects in their various stages would need to be studied anatomically. Especially atrocious murderers might be reserved for cases involving vivisection. Criminals of lower grades could be utilized in the study of diseases of minor severity, according to their physical adaptation and the nature of their crime. Having their subjects under absolute control from the inception of a disease to its termination, the investigator could not fail in time to arrive at certain knowledge both as to its prevention and mitigation, if not its cure. Medicine is full of problems whose solution might be greatly hastened by such means.

The same may be said of other departments of social science. How for, for example, is the criminal diathesis curable, and under what conditions? What is the comparative influence of the different sorts of mental and moral training? How can the taint of hereditary crime be averted? How are the various grades of criminality affected by surgical operations, especially those calculated to make the perpetuation of hereditary crime impossible? And how far may the subjects of such treatment be safely allowed at large?

But the field of investigation is limitless. The possible advantages of its systematic prosecution are correspondingly great. The right of society to defend itself against its internal enemies, even to the taking of life is unquestioned. To attempt it by means of punishment has proved unavailing and costly. It is time that a different plan be tried. Suppose we sink the idea of retribution—if need be, of reformation also—and seek to make all human vermin first harmless, then useful, either by their productive labor or by their subjective contributions to human knowledge for the protection of health and the saving of life. * * * We are disposed to think that the possibility of basing made a subject for the study of small-pox, cholera, typhoid fever, or even a bout of measles or the mumps, would restrain a pickpocket or a burglar quite as efficiently as the chance of a few weeks on the island, or a few months at Sing Sing. At least the knowledge gained by means of him and others like him, would go far to recompense society, for all it might suffer from his depredations.

A new and remarkable variety of bamboo has been brought before the French Acclimatization Society by M. Ed. Renard. This bamboo comes from the distant provinces of Honan and Su-Tchaen, China. Contrary to the usual form of stem growth, this bamboo is said to be veritably square in its cross section. At one time it was thought that bamboos of this kind were produced by pressure from the round bamboo; but M. Renard states that the canes grow in the form exhibited, and he placed at the disposal of the Society a bundle of specimens which he had collected in Japan. This bamboo grows from thirty to thirty-five feet in hight, in very close clumps. The bark is of a deep green color, which becomes of a lighter tint as it dries, but never turns to pure white. Its stems without exception are square, or square with the corners rounded off. The bamboo is described as being very straight, uniformly tapering, elastic, and admirably adapted to the manufacture of fishing rods. M. Renard attempted to send home a live specimen of this bamboo, with stems and roots, but although he carefully packed the specimens in earth in a cask sawn in halves, when they arrived at Brest, which chanced to be at the time of the French war, they were thrown into the River Garonne. Other varieties of bamboo, which were sent at the same time, unfortunately shared the same fate.—*American Artisan.*

A screen or blower of wire gauze, from thirty-six to forty wires to the inch, placed in front of range or stove fires, will prevent, it is said, smoke coming into the room when the chimney fails to draw well.

To prevent condensation in a steam pipe laid under ground, place it inside another larger pipe, filling the intervening spaces with pulverized charcoal. The outside pipe should be watertight.

Paint skins, boiled with linseed oil, and having, while hot, a quantity of sand and lime stirred in until the requisite thickness is obtained, make a durable cement for leaky roofs.

The evaporative efficiency of American anthracite and American bituminous coal is in the proportion of 8·9 to 9·9.

Butter is said to be a very sensitive reagent to reveal the presence of copper.

Plating and Gilding without a Battery.—A very useful solution of silver or gold for plating or gilding without the aid of a battery may be made as follows: Take, say, one ounce of nitrate of silver, dissolved in one quart of distilled or rain water. When thoroughly dissolved, throw in a few crystals of hyposulphite of soda, which will at first form a brown precipitate, but which eventually becomes redissolved, if sufficient hyposulphite has been employed. A slight excess of this salt must, however, be added. The solution thus formed may be used for coating small articles of steel, brass, or German silver, or by simply dipping a sponge in the solution and rubbing it over the surface of the article to be coated. I have succeeded in coating steel very satisfactorily by this means, and have found the silver so firmly attached to the steel (when the solution has been carefully made) that it has been removed with considerable difficulty. A solution of gold may be made in the same way, and applied as described. A concentrated solution of either gold or silver thus made, may be used for coating parts of articles which have stripped or blistered, by applying it with a camel hair pencil to the part, and touching the spot at the same time with a thin clean strip of zinc.—*Ex.*

The paper upon which the Bank of England notes are printed has been made, since 1791, at Laverstock, Hants. It is noted for its peculiar whiteness; its thinness and transparency; its crisp and rough feel; its water mark—made in the paper, and on the same side as the printing; its three uncut edges, and its strength. It is made of new linen and cotton. A bank note will support thirty-six pounds before it is sized, and it is thought will afterward support a man for years, if it is for a right amount.

Using Hard Water for Steam.—When boilers are ordinarily fed with hard water, it is worth while to save the drippings of the exhaust pipe, the condensation of the safety valve blow-off, and that from the cylinder, and use the water thus obtained to fill the boiler after blowing off. The result will be surprising in effect in loosening scale. So says the *Scientific American.*

Carbolic Acid for Cattle Disease.—Carbolic acid is being used in England as a preventive and cure for the cattle disease. An Essex farmer informs the London *Times* that he had used carbolic acid freely, and that out of about 1,000 head of cattle he had not lost one.

Good Health.

Dietetic Effects of Water.—Certain experiments made by a French savan, with the view of ascertaining how far the phosphate of lime in bone may be replaced by other phosphates, have been used by Mr. W. J. Cooper, of London, England, to illustrate how profoundly the bodies of animals are influenced by the waters they drink. This is an aspect of the water question which will be new to most people; but there is no doubt that the composition of the body is materially influenced by the mineral constituents of the fluids we habitually drink. The active effects of several mineral waters upon the functions are well known; it is not so generally known that water from artesian wells, so pure from organic pollution, sometimes contains sulphate of magnesia and other salts to such a degree as to be positively injurious. On the other hand, in some districts in Holland, where there is only rain water to be obtained for drinking purposes, softening and distortion of the bones are frequent. That, as shown by the experiments referred to by Mr. Cooper, the use of natural waters may tend to alter the structure of our bodies, introduces another element into the much-vexed question as to the proper source whence to draw the supplies of potable water for towns, by showing that the inorganic impurities of water are of more importance to health than they have been usually considered; while it lends support to the opinion that the same conditions have something to do with the goitre and other glandular affections endemic over certain regions.

Arsenical Wall Papers Again.—This matter has been so frequently brought before the public of late, and so many facts adduced to show the dangerous character of arsenical papers, that we are persuaded but few people place a paper upon their rooms without taking the precaution to know that the colors are free from this dangerous poison. Still, cases do yet once in a while come up, where the proper precaution is not used. The latest case which has come to our attention, is one where unmistakable symptoms of arsenic poison were found in a family, which was traced directly to the paper upon the walls. It was found on examination, that upon the walls of their house, out of seven kinds of paper covering them, six contained the poisonous mineral to a greater or less, in one case to a very large, amount. On leaving the house, preparatory to the removal of the paper, the family speedily got rid of the symptoms of arsenical poisoning. Cases like this show the necessity that exists for the protection, by legislative enactment, of the public health to a greater extent than is at present afforded.

Growth of Country and City Boys.—According to Mr. Oalton, country boys of fourteen years, in England, average one and one-fourth inches more in hight, and seven pounds more in weight, than city boys of the same age, as shown by the examination of a large number of boys in country and city schools.

The Treatment of Fever.

In an article in the Dublin *Medical Journal*, Dr. Jones reaches the following conclusions:

1. That in the treatment of fever, typhus and other forms, too much reliance has been placed on alcoholic stimulants, and that fashion, rather than reason, has swayed many in their indiscriminate employment.

2. That the percentage of cases requiring such stimulants is a low one; and that while our administration of them, as regards quantity and kind, must depend entirely on the condition of the patient, still the utmost caution (with our present knowledge of their physiological action) is required.

3. That in digitalis we have a powerful cardiac stimulant, which, while it gives force to the heart, does not do so at the expense of the system, but rather is a conservative agent, which controls expenditure and limits waste of vital action; always, of course, remembering that a large number of cases will recover without any specific treatment save that care and guidance which provides for the wants of the system and secures the patient from the risks of complications. The digitalis appears to be indicated in the early periods of many cases of typhus in which we have a rapid pulse and high temperature range, regulating our administration by its effects on both, using it rather with the object of guiding the patient up to a certain point than of curing the disease.

Perspiratory Glands.—The perspiratory glands of the skin, says Dalton, are scattered everywhere throughout the integument, being most abundant on the anterior portions of the body. They consist each of a slender tube, about one-fourhundredths of an inch in diameter, which penetrates nearly through the entire thickness of the skin, and terminates below in a globular coil, very similar in appearance to that of the wax glands of the ear. These glands are very abundant in some parts. On the posterior portion of the trunk, the cheeks, and the skin of the thigh and leg, there are, according to Kranse, about 500 to the square inch; on the anterior part of the trunk, the forehead, the fore arm, and the back of the hand and foot, 1,000 to the square inch; and on the sole of the foot and palm of the hand about 2,700 in the same space. The whole number of perspiratory glands is not less than 2,300,000, and the length of each tubular coil, when unraveled, about one-fifteenth of an inch. The entire length must be not less than 153,000 inches, or about two miles and a half. The fluid derived from this extensive apparatus is the perspiration. It is a clear, colorless, watery liquid, with a distinct acid reaction. Its constitution is as follows: Water 995·00, chloride of sodium 2·23, chloride of potassium, 0·24, sulphate of soda and potassa 0·01, salts of organic acids with soda and potassa 2·02—total, 1,000·00. Any sudden checking of the action of these pores is very hurtful, as their free action is one of the requirements of a healthy body. Closing of the pores of the skin by the use of certain washes or powders to prevent excessive perspiration, as is sometimes done with the feet, where they are most numerous is a dangerous experiment.

Insulation of the Bed in Rheumatism.—Dr. E. Playter, of Toronto, gives a case in the *Canada Lancet*. The patient was ordered to be insulated, which was done by placing the legs of the bedstead in four glass salt-cellars. The next day he was decidedly easier, and continued to improve rapidly, so that he was entirely free from pain in three or four days more, and able to walk about the house. The constitutional symptoms in this case were not of a very marked character. The heart's action was labored and irregular in the beginning, but not quickened, tongue slightly coated, white, with considerable thirst, but perspiration not profuse; though these symptoms, excepting the heart's action, were gradually becoming more aggravated up to the time when insulation was tried. The patient had had two previous attacks, similar, but of much greater duration; from which he had entirely recovered. His father had suffered from two or three very severe attacks of acute rheumatism. Dr. Playter adds, "One such case does not prove much in favor of insulation, but the improvement in the one above referred to, commenced earlier, was more rapid and decided than that of any other case of the like severity which I have treated, in a practice of about fifteen years."

Chinese Treatment of Small-pox.—The Shanghai *Gazette* states, that shortly before the death of the late Emperor of China, a gigantic image, the goddess of small-pox, was paraded round the city of Pekin in solemn procession, and then taken into the very bedroom of the dying youth, where it was worshipped and honored with many propitiatory offerings. As, however, the goddess continued obdurate, she was subjected to a severe thrashing and other insults, and finally burned. The fatal result of the attack was, we suppose, her revenge for the maltreatment.

Hygienic Training.—The good resultants of systematic training in hygiene, under the direction of a regular professor, are shown at Amherst college by the fact that, according to a record kept for the last fourteen years, there is a large and constant decrease in sickness from the beginning to the end of the college course, the freshmen being always the most sickly, and the seniors the most healthy class.

Domestic Economy.

Choice of Meat, Poultry and Fish.

Beef.—The grain of ox beef, when good, is loose, the meat red, and the fat inclining to yellow. Cow beef, on the contrary has a closer grain, a whiter fat, but meat scarcely as red as that of ox beef. Inferior beef, which is meat obtained from ill-fed animals, or from those which had become too old for food, may be known by a hard, skinny fat, a dark red lean, and in old animals, a line of horny texture running through the meat of the ribs. When meat pressed by the finger rises up quickly, it may be considered as that of an animal which was in its prime; when the dent made by pressure returns slowly, or remains visible, the animal had probably passed its prime, and the meat consequently must be of inferior quality.

Veal should be delicately white, though it is often juicy and well flavored when rather dark in color. Butchers, it is said, bleed calves purposely before killing them, with a view to make the flesh white, but this also makes it dry and flavorless. On examining the loin, if the fat enveloping the kidney be white and firm looking, the meat will probably be prime and recently killed. Veal will not keep so long as an older meat, especially in hot or damp weather; when going, the fat becomes soft and moist, the meat flabby and spotted, and somewhat porous like sponge. Large overgrown veal is inferior to small, delicate, yet fat veal. The fillet of a cow-calf is known by the udder attached to it, and by the softness of the skin; it is preferable to the veal of a bull-calf.

Mutton.—The meat should be firm and close in grain, and red in color, the fat white and firm. Mutton is in its prime when the sheep is about five years old, though it is often killed much younger. If too young, the flesh feels tender when pinched; if too old, on being pinched, it wrinkles up, and so remains. In young mutton, the fat readily seperates; in old, it is held together by strings of skin.

Sweet Potato Pudding.—To a large sweet potato weighing two pounds allow half a pound of sugar, half a pound of butter, one gill of sweet cream, one gill of strong wine or brandy, one grated nutmeg and a little lemonpeel, and four eggs. Boil the potato until thoroughly done, mash up fine, and when hot add the sugar and butter. Set aside to cool while you beat the eggs light, and add the seasoning last. Line tin plates with puff paste and pour in the mixture. Bake in a moderate, but regularly heated oven. When the puddings are drawn from the fire, cover the top with thinly sliced bits of preserved citron or quince marmalade. Strew the top thickly with granulated white sugar, and serve with the addition of a glass of rich milk for each person at table. The above quantity is sufficient to fill three plates, and one quart of flour will furnish enough pastry for so many puddings.

Another sweet potato pudding recipe is the following, furnished by the New Orleans *Home Journal*: Take twelve or fifteen nice sweet potatoes (yams always preferred), boil them until well done; then peel, mash with a pestle or rolling-pin, and rub through a sieve to get out all strings or tough fibers; now add sugar to taste, a half-dozen eggs, butter to make it very rich, ground cloves, nutmeg and sweet milk enough to make it the consistency of custard; you can pour the mixture into a buttered pan, and bake. Nice fresh lard can be used instead of butter, but in smaller quantity.

Preserving Eggs.—Dr. Sacc, of Switzerland, has again brought forward the method of preserving eggs by covering the eggs with a layer of paraffine in the proportion of one kilogramme to about three thousand eggs. When this has been done, they neither diminish in weight or freshness for months. Dr. Sacc has shown, by eggs preserved in this way for two years, that they did not present any trace of decomposition. Of course, to preserve eggs, in a profitable manner, they must be perfectly fresh at the outset, for paraffine does not prevent the process of decomposition from continuing if already begun. One of the most common causes which lead to the spoiling of eggs, is the fact that broody hens sit on the nests and keep the eggs warm. Paraffine has several advantages over gum, which has been used; it is cheaper and fewer eggs are spoiled, gum and other substances being an inadequate agent in stopping the pores of the shell. The eggs after being coated should be kept in a cool place. Tallow mixed with rosin or beeswax is the best substitute for paraffine.

To Preserve Bread for Long Periods.—Cut the bread into thick slices, and bake it in an oven, so as to render it perfectly dry. In this condition it will keep good for any length of time required, and without turning mouldy, or sour, like ordinary bread. The bread thus prepared, must, however, be carefully preserved from pressure, otherwise, owing to its brittleness, it will soon fall to pieces. When required for use, it will only be necessary to dip the bread for an instant into warm water, and then hold it before the fire till dry, after which butter it, when it will taste like toast. This is a useful way of preserving bread for sea voyages, and also any bread that may be made too stale to be eaten in the usual way.

MINING AND SCIENTIFIC PRESS

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY, W. B. EWER, GEO. H. STRONG JNO. L. BOONE

Office, No. 224 Sansome St., S. E. Corner of California St., San Francisco.

Subscription and Advertising Rates:

ADVERTISING RATES.—1 week.	1 month.	3 months.	1 year.
Per line..... .25	.80	$2.00	$5.00
One-half inch.....$1.00	3.00	7.50	24.00

WHAT WENT OVER THE CENTRAL PACIFIC RAILROAD LAST MONTH.—During the month of September the freight shipped over the Central Pacific railroads was as follows, the amounts being given in pounds: From San Francisco—Wine, 387,391; rags, 7,745; wool, 3,718,203 (7,300 bales); cigars, 5,373; canned goods, 94,347; salmon, 1,162,656 cases; salmon, 358 325 barrels; seal skins, 493,333; fur seal, 8,777; sea otter, 3,566; land otter, 245; beaver, skins, 6,595; mink skins, 614; deer skins, 2,578; marten skins, 705; bear skins, 365; silk goods, 80,743; pickles, 3,833; refined borax, 65,559; pelts, 43,130; tea, 3,109,786; Chinese merchandise, 11 370; wheat, 21,671; barley, 507,821; salt, 19,496; ivory, 16,963; quicksilver, 98,070; leather, 23,759; hops, 57,426; brandy, 13,027; antimony, 19,240; glue, 42,925; syrup, 42,180; dry hides, 233,495; woolen goods, 16,900; honey, 65,319; horses, 20,000; tobacco, 1,043; red oil, 20,400; mustard, 5,392; dried fruit, 5,733; whalebone, 2,985; merchandise, 86,874. Total, 10,885,919.

THE Clay Street railroad company contemplate running their line to the Oakland ferry landing. The design is to start from Dupont street on trestle work and keep that level to the terminus.

IT is expected that the steam hoisting works at the Livermore coal mine was started up this week.

Another Banking Epoch.

This has been another sensational week in our banking history; though this time it has been of the most cheering, hopeful character. On Saturday of last week the Bank of California resumed business, under circumstances almost romantic, but in strict keeping with the character of our people. The syndicate appointed to reorganize the bank had evidently prepared for the worst, and the assurance of this on the part of the public, created a degree of confidence which produced the best results. The great rush was for depositing, and not for the withdrawal of money; no one calling for money, only those who actually needed it. The deposits during the day amounted to $1,130,000; and there were paid over the counter, $254,000; leaving a balance in favor of the bank of $876,000. There was nearly $4,000,000 in the vaults when the bank opened, and it closed with about $4,500,000 ready for use. It opened amid the firing of cannon, the hoisting of flags, and the cheers of thousands of rejoicing citizens. It kept open an hour beyond its usual time of closing, and when it closed there was a general feeling of satisfaction.

If this were to be properly accepted as a mere burst of enthusiasm, and indication of California pride and chivalry, the more prudent portion of the community would have found little cause for rejoicing in the occasion; but its effect in restoring business confidence—our greatest need at the time—was remarkable; and those whose feeling toward the institution were of a suspicious or unfriendly character, are free to acknowledge the advantages conferred on the community.

On the Monday following, the Nevada bank, popularly known as the "Bonanza bank," began its career; and a brilliant career it is to be, according to the faith of the public. This opening was less melodramatic in character, but crowds of spectators were in waiting to witness the opening scene. During the day the inside and workings of this promising institution was the sight that every one, who could, must see. We passed in and out with the curious throng, to admire like the rest, the splendid equipments and nice workings of the grand financial review; and if we should declare that when we passed out we did not "cast one longing, lingering look behind," at the stacks of the root of all evil there displayed, we should simply claim to be better than our neighbors, and this we endeavor to guard against.

About a million dollars was to be seen there, and during the day about half a million was received on deposit. The Nevada bank is supposed to have had in its vaults on Monday night, $5,500,000 in coin, and the Bank of California about $4,500,000. The remaining coin in the city is estimated at between six and seven millions. This is a mighty power in the land; but we are charitable enough to believe that it will, in the main, be used for good rather for evil; and that it will be allowed to go forth, hand in hand, with earnest, hopeful, intelligent labor, to secure the permanent prosperity and happiness of the country!

Close of the Great Industrial Fair.

On the evening of the date of this paper, the great Industrial Exhibition, under the auspices of the Mechanics' Institute, closes its doors, probably for two years. This great undertaking has been a success in every sense of the word. The unqualified praise which it will undoubtedly receive, should be about equally distributed in three quarters. First in order, according to the popular verdict, and we are not disposed to disagree, come the Directors of the Fair, who deserve great credit for the grand scale on which the exhibition was conceived, and the perfectness of the innumerable details. Each one of these officers may well claim that he has "done the State some service;" not in "moving accidents in flood and field," but in the sphere of mechanical skill and artistic taste; where California is at the present time in most need of their service.

Next in order come the host of the exhibitors—about a thousand in number—who have given ocular proof that California is not behindher sister States in the arts and industries. In the various mechanical departments the display included a wonderful variety of articles, from the ordinary requirements of housekeeping to the highest achievements of mechanism and science.

Third in number, but fully equal in honor on the credit roll, comes the public, who have not only furnished, what is familiarly termed "the needful" in sustaining the meritorious enterprise, but have supplied—what is as greatly needed under the circumstances—a thorough appreciation of the completeness of the exhibit. The characteristic liberality of our people would have supplied the requisite money for supporting even this vast undertaking, and the mere love of novelty would have been sufficient to cram the vast Pavilion for a limited number of days and evenings; but something more than these incentives was needed to keep up the almost unvarying flow of interested visitors during the long period of eight weeks.

Utilizing Angora Goat Skins—A New Industry.

On the left hand side isle of the Mechanics' Pavilion, before reaching the stairs, Mr. G. S. Andrews makes a fine exhibit of furs and skins, for robes, mats, rugs, gloves, ladies' cloaks and sacques, dress cap and coat trimmings; also, of skins tanned, in a superior manner, for saddlers' and upholsterers' work. This entire display, in all its variety, is from the Angora robe and glove manufacturing company, of San Jose, for which company Mr. Andrews, the exhibitor, is agent for this city. This is a new company recently formed and put into operation for manufacturing such articles as above enumerated, from Angora goat and deer skins.

This company has the sole right to use, in this State, a new and valuable process for tanning and dyeing, by which a very superior article is produced. By this process a goat skin is tanned so as to be almost as soft and pliable as a buck-skin; while it is not liable to the disadvantages of the latter in the absorption of water, from which peculiarity buck-skin gloves are of but little use in rainy weather. The colored mats and robes exhibited by Mr. Andrews are of a very superior quality, and of fast colors. This branch of manufacture is, we believe, quite new on this coast; or at least it has never before been made a success here.

Some of the samples of the Angora goat skins exhibited are really beautiful. The fine texture and beautiful lustre of these skins render them really elegant and very desirable. The exhibit was received too late for entry in the catalogue and for competition for premiums, otherwise, we presume, this new industry would have received honorable mention from the committee of awards.

We understand that, at the suggestion of several of our bookbinders and others who make use of morocco in their business, this company proposes to undertake also the manufacture of morocco, as it is evident that goat skins tanned by this new process will produce an article of morocco much superior to that which is obtainable from the East. This industry will furnish another incentive to the prosecution of the Angora goat business, as by it the skins and pelts will receive additional value. Cash is paid by the company for both goat and deer skins, when properly prepared. Skins should be thoroughly salted when first taken from the animal, and dried in the shade. Sun-dried skins are worthless.

Committee to Raise Funds for the Centennial.

At a meeting of the State Board of Centennial Managers on Tuesday afternoon last, it was determined that the Finance Committee should approach citizens for funds on two propositions: first, that they should obtain donations, and secondly, that they obtain loans subject to the condition that the money be repaid when the Legislature makes an appropriation in aid of the Centennial. The following committees were appointed to collect funds, to pay expenses, and to aid exhibitors, etc.:

Committee for San Francisco—Messrs. Jacob Deeth, T. J. L Smiley, J. F. Snow, J. P. H. Wentworth, S. G. Gardiner, W. K. Vanderslice, P. A. Campbell, Irving M. Scott, Ira P. Rankin, H. H. Bigelow.

For the counties in which the members reside, to wit: Gov. S. G. Downey, Los Angeles; Dr J. L. Ord, Santa Barbara; Major J. R. Snyder, Sonoma; Hon Drury Melone, W. H. Mills, Sacramento; Hon. Jacob R. Neff, Placer; Hon. J. L. Hebron, Hon. B. W Sergeant, Monterey; Hon. R. K. Porter, San Diego; Hon. Joseph Aram, Santa Clara; Wallace Everson, Alameda; General J. B. Frisbie, Solano; Hon. Austin Sperry, San Joaquin; Hon. Chas. Gordon, Yuba.

J. L. Creigh was chosen President, and Jacob Deeth, Secretary, to whom all applications for space and information must be made.

W. T. Whittier was elected Treasurer.

The Board adjourned to meet at the call of the President.

A MAN named Peter Cleary met with a terrible fate on Battery street a few days since. While engaged in hoisting a large block of marble by hydraulic pressure, he put his head underneath to see that all was working satisfactorily, when the support gave way and the great mass fell upon him, crushing his skull in and killing him instantly.

THE editor of the Placer *Herald* has been visiting the Lincoln pottery. The quality of pipe turned out at their pottery is said to excel that manufactured in the Eastern States or Europe.

THE London and San Francisco bank is to increase its capital from $3,000,000 to $5,000,000.

AN effort is being made to start metallurgical works in Los Angeles.

THE San Pedro street and East Los Angeles horse railway is now being pressed forward.

Garratt's Brass Foundry.

The brass foundry and machine works of Wm. T. Garratt are well represented at the Fair, the display being as ornamental, as well as useful, as any in the machinery department. A very large upright show case filled with every imaginable variety of brass goods; a row of handsomely ornamented steam pumps, all at work; a collection of bells of all sizes; piles of pure copper, Babbitt and Garratt metal; large globe valves, and the shine of brass in all directions, makes up a display which attracts the attention of even the most careless observer.

Church and steamboat bells are shown, weighing from four pounds up to 1,000 pounds, all made at these works, in this city. With these samples of modern workmanship is placed a bell weighing about 100 pounds, and which is nearly 200 years old. It was made in Mexico, and bears the inscription "Jesus Maria, 1690," being evidently a convent bell. There is also a medallion, a crucifix and a coat of arms upon it in high relief. This bell is made of the best bell metal, and the design and workmanship compares very favorably with those of more modern manufacture.

In the large and handsome show case placed against the wall at the rear of the exhibit, are shown many varieties of brass goods, all finely finished and neatly and artistically arranged. Among them are steam whistles, steam gauges, vacuum gauges, hydraulic hose pipes and nozzles, gauge and cylinder cocks, nil cups of all patterns, firemen's torches, Anderson's patent revolving sprinklers, steam cocks, etc. The exhibit also contains finished check and globe valves, hydraulic nozzles proper for mining, large iron shell globe valves, brass and composition globe valves, Coffin's patent globe valves and water gauges, etc.

A unique looking pile of metal bars of different kinds is an attractive feature. In this may be seen both California and Lake Superior refined copper. The California copper is shipped from here to Baltimore in ore, and returned to us refined metal. A number of bars of Babbitt and Garratt metal are also displayed, the Garratt metal being applicable to the same purposes as the well known Babbitt metal.

A prominent feature in this exhibit is the Hooker steam pump, several sizes of which are shown. Four of these pumps, of different capacities, have been mounted on neatly arranged stands, and are kept constantly in operation. The bright parts of these pumps are nickel plated, and, altogether, they make a very handsome appearance. The largest one is a No. 8, with 12-inch steam cylinder, 8-inch water cylinder and 16-inch stroke. Its capacity per hour is 30 000 gallons, 300 feet high. The No. 6 shown has an 8-inch steam cylinder, 5-inch water cylinder and 12-inch stroke, with a capacity of 7,500 gallons per hour, at ordinary speed. No. 4 has a 5-inch steam cylinder, 3-inch water cylinder and 8-inch stroke, with a capacity of 2,500 gallons per hour. No. 1 has a 2¾-inch diameter steam cylinder, 1½-inch diameter water cylinder, 4-inch stroke, with a capacity of 500 gallons per hour at ordinary speed. The No. 6 is the one which is to be used at the competitive trials of pumps at the Fair.

Several styles of this make of pumps are shown—the Hooker steam, Hooker double acting and force and deep well and ship pumps. All of these are made by W. T. Garratt. This direct acting steam pump has an enviable reputation on this coast, where it is in use for mining purposes, feeding boilers, fire purposes, irrigating, etc. It has no tappets or tappet arms, valve rods, eccentrics, or any complex outside gear. Its working parts are covered and protected. Over 5 000 of the Hooker deep well pumps are in use in California alone, some of them working in wells 140 feet deep. They serve as a domestic pump about the farm or garden, being equally well adapted for hand, windmill or steam power. Several important improvements have been lately made in their construction, there having been added brass valve seats and spindles, vulcanized rubber puppet valves and elastic piston packing, to compensate for wear in the cylinders. The body of the pump is made in one casting, without chambers or pointe of any kind.

Mr. Garratt has been in business in this city for many years, and has the largest brass foundry on this coast. He manufactures every conceivable description of brass work for plumbers, gas and steam fitters, engine builders, steamship boilders, railroad and water companies, etc. He is also proprietor and manufacturer of the famous styles of Hooker pumps referred to, and importer of iron pipe and fittings. The line of brass goods manufactured is in endless detail, and would take a good sized pamphlet simply to enumerate.

CLEAN-UP BY THE OMAHA MINE.—The Grass Valley *Union* says that the last clean-up of the Omaha mine was very satisfactory. The result is as follows: 125 car loads of ore crushed; yield of gold 450 ounces, worth here $17½ per ounce, or a total of $7 875, which gives $63 to the load. The sulphurets saved from this crushing have not yet been worked, and their value is not included in the above statement. The sulphurets saved will run the yield up to above $70 a load.

THE Emperor of Brazil is to visit this country.

Metallurgy of the Copper-Silver Ores of Inyo County—No. 6.

[Written for the PRESS by SAMUEL PURNELL.]

Concentration.

There is no branch of metallurgy in which such differences of opinion are held as in concentration. A large number of machines have been invented, almost countless contrivances adopted, and numberless experiments made; but probably in no branch of mechanics have there been so many failures. That which seems easy is in reality very difficult. The concentration of gold sands, or the separation of galena or blende from quartz, by reason of the great difference in specific gravity of the former, and the regular cleavage of the latter, and the crushing of the quartz without cleavage, renders such ores very easy to concentrate. But in case an ore contains various minerals of nearly the same angle of cleavage, the same size of grains, nearly the same specific gravity, carrying also clay and lime and its most valuable constituents in a soft or powdery condition, the difficulties of economically separating such minerals becomes very great, and almost unsurmountable. Such has been found to be the case thus far with the copper-silver and fahl ores of Inyo county. The direction in which success will probably lie is endeavored to be indicated in the following:

Concentration must first of all begin with the miner, by rejecting, as far as he is able, all worthless vein stuff, and only sending up such ore as will probably pay the cost of beneficiation. When the ore is hoisted it may be again overlooked and worthless rock removed. Mud may have to be washed off. The ore is next usually spalled or broken into small pieces with hammers. A further quantity of gangue may be then removed. It is next necessary to resort to machinery to further reduce the size of the pieces of ore.

Crushing in this country, as preparatory to concentration, has been usually performed by stamps, having first passed the ore through a rock breaker. Stamping may be the cheapest mode of pulverizing an ore, but pulverization is just what is to be avoided in concentration. The objections to stamps are that the ore is powdered too much, the natural cleavage of the mineral is neutralized, and the whole mass is reduced to dust. When this is the case, one of the most important prerequisites to economical concentration is rendered impossible of fulfillment—that of sizing the ore. A proper sizing demands the exercise of the greatest experience and much correct judgment. If the particles of ore are reduced below their natural size, a serious loss will be the result; while if they are not fine enough, a portion of the waste will adhere to the valuable matter, and it will be thus impoverished, or the waste will carry into the tailings a large quantity of valuable mineral. Much less importance is attached in this country to sizing than the facts of the case warrant. Most minerals have a particular cleavage and break up into particular shapes. Quartz breaks into pieces of all possible shapes. Sizing can only be omitted with a loss of valuable matter. It is of vital importance that the grains of an ore which are to be concentrated should be as nearly as possible of the same size; as otherwise the smaller surface of ore fragment in proportion to its weight will, in a measure, compensate for the greater density of another, and thus cause it to assume a position in the series to which by its constitution it is not entitled. It is impossible by any mechanical contrivance to regulate the forms of the grains, which depend on the nature of the cleavage, and this circumstance always affects the results obtained. To avoid pulverization by stamps, crushing roller should be used, as then less dust is formed, and the ore particles are mostly in the shape of grains of various sizes. These latter can be run through sizing screens, and thus fitted for separation by fall through a liquid. According to Rittinger the proportion of dust, etc., from rollers is as follows: Grains, 70 per cent.; sand, 20 per cent.; flour and dust, 10 per cent. From stamps, as follows: Sand, 32 per cent.; flour, 32 per cent.; dust, 36 per cent. So although crushing by rollers is slightly more expensive than by stamps, the results are much better. Crushing to coarse sand is required if the silver is finely disseminated in the gangue. The principles of concentration are stated by Regnault as follows:

1st. If bodies differing in form, magnitude and density be allowed to fall from a considerable hight into a tranquil liquid, they will experience different degrees of resistance in finding their way to the bottom, so that they will not all reach it at the same time, but will arrange themselves in a certain order. If these bodies have the same form and dimensions and differ only in density, all these bodies will lose an equal amount of force in passing through the liquid. The loss will be felt most by bodies of less degree of velocity, such as bodies of less specific gravity. They will fall more slowly through the liquid than denser bodies and, arriving last of all at the end of their course, will be found last on the denser bodies in gradnated order, the most dense being at the bottom, and the least dense at the top.

2d. If bodies which fall through the liquid are of similar density and form, but varying in magnitudes, their velocity will be proportioned to their size, and the largest fragments will form the lowest stratum. The bodies being alike in density and form, the resistance varies with the surface.

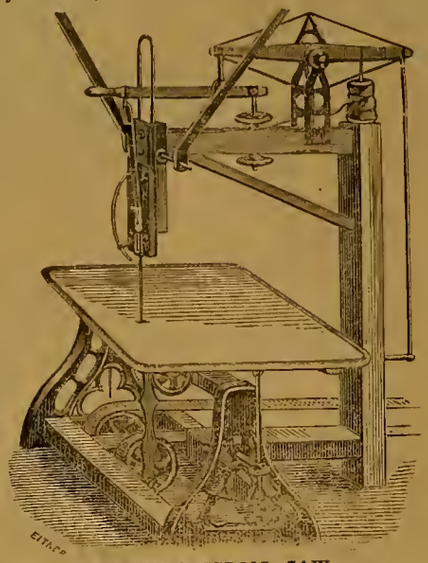
3d. If all bodies have the same volume and density, but vary in form, some being cubical and others flat or in scales, the latter having more surface experience more resistance in passing through a liquid. The cubes will arrive first at the bottom.

As the metalliferous part of a vein is usually much denser than the gangue it is evident, that with proper preparatory treatment, the mineral in its fall will arrive first at the bottom, and will be followed by fragments of mineral and gangue, and the pieces of poor gangue will arrive last. The forms of ore particles will chiefly depend on the molecular constitution of the mineral. Hence it is likely that among ore fragments, all of which have passed through the same riddle, there may be found lamellar pieces of the mineral, and cubical or spherical pieces of gangue. The mineral by its superior density would tend to pass through more quickly than would the gangue; but the latter in consequence of its form, may experience less resistance than the former, and consequently they may arrange themselves according to the inverse order of their densities. Cases of this kind constantly occur in practice.

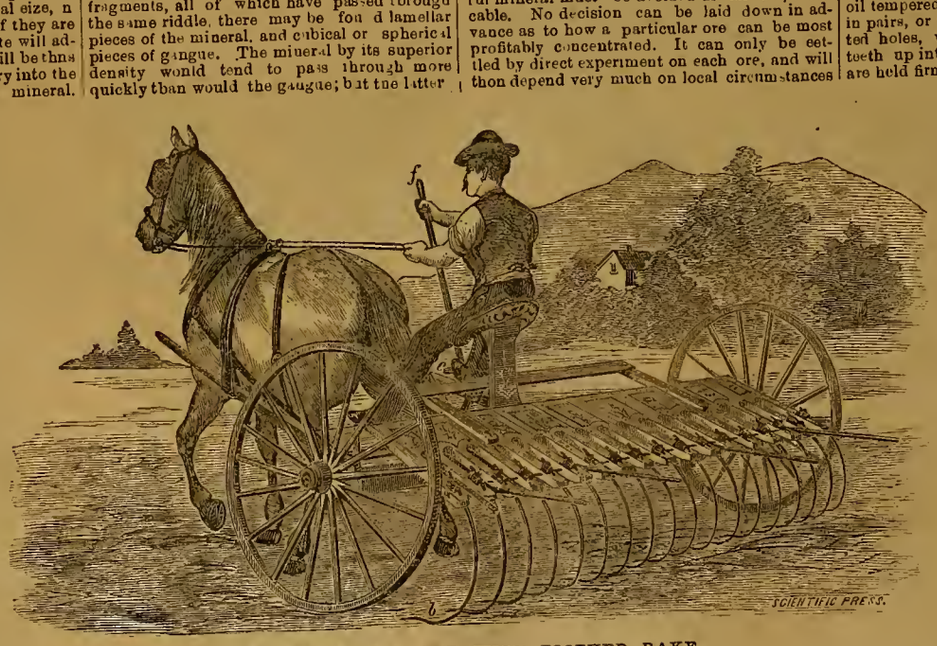
From this some idea may be obtained of the difficulties of concentration; and when it is further considered that in reference to silver ores, especially, a large proportion of the valuable matter when crushed is in the form of dust or slime and liable to float away in the liquid, it will be seen that a proper concentration of these ores is one of the most difficult problems in metallurgy. In such cases separation can only be secured after much labor and care and usually at the expense of a large loss of silver. The concentration of some ores is so delicate that any attempt to concentrate them beyond a given standard will lead to enormous lose. In fahl ores and silver sulphurets generally, the silver is so fine and powdery after crushing that it flows away when subjected to water, and will evade the most delicate contrivances set for its capture. The more finely divided the greater is the loss, and the more imperfect the operation.

All processes of concentration will remove a portion of the unproductive part, and no system will economically remove every part of it. We are compelled to resort to a partial separation only. It would not usually be desirable to separate all the gangue from the ore, even if we could, on account of the absence of economy thereby, and perhaps giving rise to difficulties in the subsequent silver extraction. It may be a question whether there is much profit in concentrating an ore that is to be roasted and treated by a wet process, as the loss in, and cost of concentration, may be more than the cost of passing the inert matter through the furnace and leaching. In every case such questions must be decided by local circumstances.

Kustel, in his work on concentration, lays down its requirements as follows: 1st. Each constituent must be brought to the highest value which can be advantageously given to it 2d. The useful minerals must be concentrated only to the most advantageous degree of purity 3d. All loss of the quantity and value of useful mineral must be avoided as far as practicable. No decision can be laid down in advance as to how a particular ore can be most profitably concentrated. It can only be settled by direct experiment on each ore, and will then depend very much on local circumstances



HANSEN'S SCROLL SAW.



BONNEY'S IMPROVED WIRE TOOTHED RAKE.

proved modern processes, when adapted to specific ores, on a scale of forty tons a day, amounts to about $5 per ton. This does not, of course, include losses.

[To be Continued.]

Hansen's Scroll Saw Machine.

An accompanying illustration shows the improved scroll saw machine, invented by Mr. M. Hansen, of this city. This gentleman is a practical mechanic, and, for a long time before the invention of this improvement, felt the necessity of a saw that could at the same time be run at a rapid speed and keep an equal tension on the saw.

In this machine the inventor has overcome this difficulty. The finest kind of saws, also, can be used, and the most delicate work can be done on it. It can be run at a very high rate of speed, and by a simple arrangement of levers a steady motion is had, so that there is no shaking or jerring to retard the progress of the saw, and, therefore, much more work can be accomplished than with the common spring saw.

This saw is very valuable to the pattern maker, as it has an adjustable table that can be set to any position desired to work the pattern. It is also claimed that all pattern work, except the most intricate, can be done on this without hand drafting. It is built in a substantial manner, and in cost is less than the ordinary spring saw. One of them may be seen in practical operation at 221 Mission street, or at Messrs. Sanborn & Byrnes' stair building rooms, in Mechanics' Mills.

Mr. Hansen is also the inventor of a shaper guard, to protect the hands while operating the shaping machine. There are few mechanics who run these machines but that at sometime lose a finger, or receive a very severe cut, and it is, therefore, very desirable that some guard be constructed that will insure protection. From the construction of those manufactured by Mr. Hansen, we should think they would afford perfect protection, and when they are once before the public, no doubt they will come into general use. Sanborn & Byrnes employ these also in their factory, and express themselves as highly pleased with the result. Mr. Hansen's manufactory is at No. 40 Spear street.

Bonney's Improved Rake.

Mr. O. Bonney exhibits at the Fair a newly invented wire toothed rake, which, as it has some new and ingenious features, is interesting to the agricultural community. From the engraving we have prepared, its peculiarities may be seen by those who have not an opportunity to examine it. The advantages claimed over the ordinary wire rakes are: the teeth are oil tempered, and are connected to wood bars in pairs, or work singly, passing through slotted holes, which prevents side motion of the teeth up into a circular iron head, where they are held firmly by set screws. The teeth have a crooked or circular point, as will be observed at *b*, for the purpose of running sharply upon the ground, gathering everything, or riding over fallen grass.

This is quite an important point. The ordinary teeth scratch the ground all the time. The lower end of these teeth can be made to clear the ground slightly, or rakes close to it as desired. By simply setting the teeth by means of the thumb screws, the points are adjusted to any desired distance from the ground, so in raking over old fields the rubbish is left.

The bars holding the teeth rise and fall independently, thereby allowing the teeth to follow the unevenness of the ground, gathering much closer than rakes with long, rigid beams. The rake is handled with perfect ease, (the draft of the horse being changeable on the hand lever, *f*, on which is a movable foot iron, *c*, for holding the teeth to the ground when raking. A slight draft in the hand lever, *f*, back, easily dumps the load when the rake is in motion. In drawing, the draft of the horse is almost in line, so there is no strain on the hand. By taking the foot from the foot iron, *c*, and drawing the lever toward the driver with the hand, the draft is changed, and the horse dumps the load from the rake in the usual way. This rake is quite simple, its advantages over the primitive rakes being easily recognized. Mr. O. Bonney, No. 221 Mission street, will give any further information desired concerning it.

THE Wilmington *Enterprise* says that soon there will be a sufficient depth of water to admit all the steamers of the coast line. The next step must be either to dredge the upper end of the bay, or extend the railroad to deep water.

ABOUT seven miles of the trackway of the Los Angeles and Independence railway is completed to Los Angeles, and it is advancing at the rate of about three-quarters of a mile a day.

DEWEY & CO.

American & Foreign Patent Agents.

OFFICE, 224 SANSOME STREET, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in pstent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Victoria, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Grenada, Chili, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country SOONER than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more directly judge of the and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents, or purchasers of patented articles, can often receive advise of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

Price Reduced to 16 Cents Per Pound.

SAN FRANCISCO, November 10th, 1874.

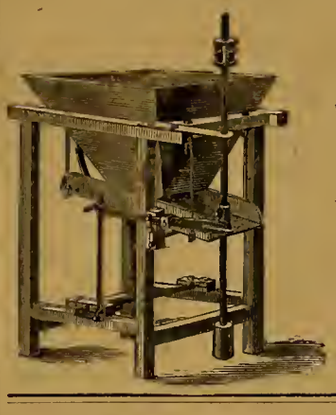
To Supts. of Quartz Mills and Mining Men generally:

We take pleasure in stating that owing to the rapid increase in our orders, our Pittsburg Manufacturers have been compelled to add largely to their works—a new gas furnace and heavier trip hammer—and are thus enabled to reduce the cost of steel and at the same time produce SHOES AND DIES superior to any yet manufactured. We have consequently reduced the price to 16 cents per pound and solicit a trial order, guaranteeing that you will find them at least 10 per cent. cheaper than the best iron. There are no STEEL SHOES AND DIES made excepting under our patent and sold at this office, or by our authorized agents, though certain Eastern manufacturers advertise STEEL SHOES AND DIES which are only cast iron hardened by the addition of a composition. They will not out-wear two sets of common iron, though called steel. They are very brittle and are not capable of being tempered, flying from under the hammer like cast iron. Our STEEL SHOES AND DIES are in use in many of the largest mills on the Pacific Coast, and all who have tried them pronounce them cheaper and far superior to iron in every respect, even at the old price of 20 cents per pound. Their advantages over iron are cheapness on first cost, increased crushing capacity, time saved in changing and in setting tappets, increased value of amalgam by absence of iron dust and chippings, and a saving of 75 per cent. in freight. It takes 60 days to fill orders from the manufactory East. Price 16 cents per pound shipped at San Francisco. Terms liberal.

Address all orders, with dimensions, to W. R. Townsend, Secretary.

1v29-3m EAST STEEL SHOE & DIE CO., Room 4, Academy Building, S F

Tulloch's Automatic Ore Feeders.



Will Feed Wet or Dry Ore Equally Well.

Will Increase the Quantity from One to Two Tons Per Day.

Are Durable, Compact and Cheap.

For Full Description, Send for Circulars.

F. OGDEN,

310 California Street, SAN FRANCISCO.

The Ingersoll Rock Drill.

Thie Drill ie nsed exteneively in the Eaet ern Statee and all Foreign Countries.

IT CAN BE RUN WITH

LESS POWER, LABOR AND REPAIRS,

—AND—

DO MORE WORK

THAN ANY OTHER DRILL IN THE MARKET. THE

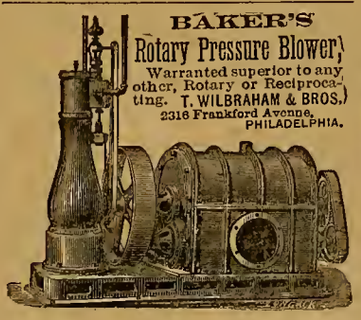
Automatic Feed

Is an important feature, as it saves labor. We ask for a trial against any competitor. For information regarding the same, send for circular to

JUDSON & SHEPARD, Agents,

Cor. Clay and Front streets, San Francisco.

BAKER'S
Rotary Pressure Blower,



Warranted superior to any other, Rotary or Reciprocating. T. WILBRAHAM & BROS.,
2316 Frankford Avenue,
PHILADELPHIA.

For Smelting Works, Foundries,

—AND FOR—

Ventilation of Mines.

Full stock always on hand.

J. C. SENDERLING,

Sole Agent for Pacific Coast, 32 Fremont Street, S. F.

1am-16p

LANE & BODLEY,

John and Water Sts., Cincinnati.

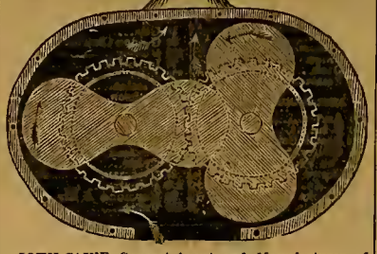
Manufacturers of

PORTABLE & STATIONARY STEAM

ENGINES,

From two to two hundred Horse Power. Send for illustrated catalogue.

ROOT'S BLOWER



JOHN CAINE, General Agent and Manufacturer of Root's Patent Force Blast Blowers and Portable Forges for the Pacific States and Territories.

Steam Engines, Steamboat, Mining and Agricultural Machinery built to order. Job work of all kinds.

GLOBE IRON WORKS, Stockton, Cal.

MACHINERY.

Iron and Wood-working Machinery, Wood Planers, Lathes, Mitre and Cutting-off Saws, Iron Turning and Screw Cutting Lathes, Planers, Shapers and Drilling Machines, Screw and Scroll Chucks, from the best makers, always on hand and for sale cheap by

NYLAN & YOUNG,

mar27eow 18 & 20 Spear Street, S. F.

BLACK DIAMOND FILE WORKS.

TRADE MARK

G. & H. BARNETT,

Manufacturers of Files of every Description

Nos. 39, 41 and 43 Richmond street,

Philadelphia, Pa.

Sold by all the principal hardware stores on th Pacific Coast. 18v25.1y

De Crano Metallurgical Works and Assay Office,

412 Commercial Street, S. F.,

Assaying in all its branches, ores analyzed, ores worked by mill process or otherwise. All assays guaranteed to correspond with U. S. mint assays. Silver and gold assay, $2.00; lead assay, $3.00; copper assay, $4.00.

J. S. OURTIS, Metallurgist.

WIRE ROPE

For Mining, Shipping, and General Purposes.

All kinds and sizes on hand, or made to order; guaranteed of unsurpassed quality, and manufactured of any length. FLAT ROPES, ROUND ROPES and TAPER ROPES, of IRON OR STEEL.

Patent Endless Wire Ropeway

(WIRE TRAMWAY,)

FOR THE RAPID AND ECONOMICAL TRANSPORTATION OF ORES AND OTHER MATERIAL OVER MOUNTAINOUS AND DIFFICULT ROADS.

This system has been in use for over three years, and given thorough satisfaction.

PATENT GRIP PULLEY,

For transmission of power by means of wire ropes

WIRE.

Fencing Wire and Staples,
ALING WIRE,
SPRING WIRE,
GALVANIZED WIRE,
BROOM WIRE,
STEEL WIRE,
COPPER WIRE,
BRASS WIRE,

And Wire of all kinds, on hand or made to order.

SOLE AGENT FOR

Richard Johnson and Nephews' Celebrated Telegraph Wire.

Full stock on hand in bond, or duty paid.

Wire Cloth and Wire Netting.

FULL ASSORTMENT ON HAND FOR ALL PURPOSES, AND

All Kinds of Goods in the Wire Line.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patsnts Issued to Pacific Coast Invsntors.

FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Diepatch, Dated Washington, D. C., Oct. 5th, 1875.

FOR WEEK ENDING SEPTEMBER 21ST, 1875.*

CHURN.—Elias Groat, Napa, Cal.

FEENER FOR THRESHING MACHINES.—Alexander W. Lockhert, Sacramento, Cal.

TIRE UPSETTING MACHINE.—John H. Meriz, Paeo Roblee, Cal.

WASH STAND AND WATER CLOSET COMBINED.—Robert C. Ball, Oakland, Cal.

*The patente are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

General News Items.

ENGLISH HOP CROPE.—A telegram from London, October 5th, states that hop-picking is completed; that is, all that will be picked, many being left on the polee that are not worth picking. It is believed that not less than one-fifth of the crop has failed.

2,694,200 centale of wheat have been received at Sen Francisco for the first qnarter of the currant harveet year. Thie amount ie somewhat lese than that received during the same period in 1873, but more than that received in 1874.

THE Market street car driver who was on dnty 17 hours each dey for 600 consecutive days, hae given out at last and it ie thought he will not recover.

TREASURER NEW states that the western banks have now more circulation than they can nse. Not very consoling to inflationiete.

A CARGO of arms deeigned for the Cuban insurgents has been eeized at Jamaica.

THE etudents dismissed from the State University eome time eince are to he reineteted.

SANGUINE speculatore look for a "booming" time in etocks about the 1st of December.

FIFTY cente on the dollar is what the creditors of Charles Clayton & Co. expect to get.

THE peculative Piuney manaeed to get away with $800,000 belonging to Uncle Sam.

THE Congregationaliets are holding their annual meeting in this city.

TURKO-SERVIAN affairs are getting more and more mixed every day.

EGYPT will send a very complete contrihntion to the Centennial.

THE Turkieh troops heve been defeated by the insurgents.

THERE hae been another outbreak in Misieeippi.

EMPEROR WILLIAM is going to Italy next week.

THE *Jefferson Borden* mntineers will be hanged.

PRESIDENT Grant has gone Eaet.

PECAN.—Several of our cotemporaries are discussing the snbject of planting trees, end with ell of them the nut bearing trees seem to be most in favor. The nut bearieg tree furnishes en article of food always, and the wood of eny nut bearer is valuable ae timber. Not one of the nut bearing trees has wood which is not usefnl. But we have seen no mention mede of the p can tree. The nute are sold in every candy or variety etore in the State, and the nut is populer everywhere. The tree ie one of the finest shade treee that growe. It will grow on any alluvial lend. As timber the pecan is next to the hickory in streugth and far superior to the hickory in lightness. The wood of the pecan tree makes finer pick handlee, axe handlee, whipetocke and all that eort of thing than any other tree. In planting, the pecen nute ehonld be obtained from the western part of Texas. There, the fruit of the tree ie much larger than any grown along the banks of the Missieeippi bottoms. The Texas variety of the nut reproduces itself, alwaye giving a large, eweet nut. Very seldom ie the Texas pecan seen in our markete here. The pecan tree is worth the attention of all who own land in thie State.—*Grass Valley Union.*

SOCIABLE PLANTS.—In a etate of nature, certain plante are always found growing singly, while others are ae invariably found growiug in groups. It ie thence inferred that the former are influenced by eome myeterious antipathy against, and the latter hy an equally strong eympathy for each other. Take the case of the common service tree, *Sorbus domestica*, under cultivation. This cannot be well grown, if planted by itself, as the plants invariably grow rickety, and alwaye become covered with galle and canker; while, if they are planted among apple trees, etc., in the same soil, and under precieely the same conditione, they thrive to perfection. If eeede of the service tree are eown by themselves, the eeedlings are alwaye poor and miecreble; whereae, if the eeed is mixed with pear eeed, the service eeedlings come up vigorouely, and often make stronger plants than the pear seedlings.—*M. Lebas.*

The Mining Share Market.

With the opening of the Bank of California and the opening of the Nevada bank, it was naturally expected that such an impetus to financial affairs would have an encouraging effect upon the stock market. The opening of the Stock Boards on Tuesday showed that the this expectation was not unfounded. Stocks opened strong and evidences were apparent that a rise along the whole line might be looked for. The following day, however, a reaction set in and now the market is pretty thoroughly demoralized, and at the present writing there is no saying when there will be any improvement.

The difference in the prices of the openiug eession for Tueeday and those of the following day may be seen by reference to our stock table.

The Indian Queeu has declared a dividend of 50 cente per ehare, payable on the 11th.

The following aeeesments have been levied during the week: Kossuth, Cerbat Consolidated, North Consolidated Virginia, Buckeye Water and Hydraulic, and Enterprise Consolidated.

The reporte from the mines both in this State and Nevada continuee of the moet encouraging character—the Comstock is more prosperoue than ever.

THOUGHTLESSNESS.—Persone sometimes return thei paper, marked "stop this paper." Their name being pasted on the sheet they think that is all we need to be able to cross their names off. Now that is thoughtlessness. Your P. O. address is needed as much as your name. We have thousands of names arranged only according to locality. Our mailing clerk does not know where everybody lives.

CONSUMPTION is impossible when coughs, colds and other acute affections of the throat and lungs are promptly met with the required doses of HALE'S HONEY OF HOREHOUND AND TAR. For sale by all druggists.

Pike's Toothache Drops cure in one minute.

WOODWARD'S GARDENS embraces an Aquarum, Museum, Art Gallery, Conservatories, Tropical Houses, Menagerie, Seal Ponds and Skating Rink.

MINING SHAREHOLDERS' DIRECTORY.

Compiled every Thursday from Advertisemente in the Mining and Scientific Preee and other S. F. Journale.]

DEWEY & CO.

American & Foreign Patent Agents.

OFFICE, 224 SANSOME STREET, S. F.

PATENTS obtained promptly; Caveats filed expeditionsly; Patent reissues taken ont; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assigoments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the varions inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valnable inventions to the notice of the public throngh the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure with the assistance of co-operative agents, claims in all foreign countries which grant Putents, including Great Britain, France, Belgium, Prnssia, Austria, Victoria, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wnrtemberg, New Zealaud, New South Wales, Queensland, Tasmauia, Brazil, New Grenada, Chili, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, bnt the drawings and specifications shonld be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our sohedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacifio States from two to six months (according to the location of the country SOONER than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, throngh our agency. We are familiar with, and have full records, of all former oases, and oan more directly judge of the and patentability of inventions discovered here than any other agents.

Sitnated so remote from the seat of goverment, delays are even more dangerous to the inventors of the Pacific Coast than to applic ants in the Eastern States. Valnable pateuts may be lost by extra time consumed in trans mitting specifications from Eastern agencies back to this coast for the signatnre of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save onr patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previons applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mntual gain. Parties in doubt in regard to their rights as assignees of patents, or purchasers of patented articles, can often receive advise of importance to them from a short call at onr office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrnsted to our agency

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valnable discoveries into practical and profitable use.

DEWEY & CO.,

United States and Foreign Patent Agents, publishers Mining and Scientifio Press and the Pacifio Rural Press, 224 Sansome St., S. F.

Mining and Scientific Press.

Started in 1860, is one of the oldest weekly journals now published in San Francisco. It has been conducted by its present proprietors for ten years, during which period it has been repeatedly enlarged and constantly improved. The active and steadfast efforts of its publishers have gained for its conduct an amount of practical experience greater than any other pnblishers have accumulated on this coast, of a weekly journal.

The sum paid by us for the best editorial talent obtainable for our special class journal; for engravings, for interesting news and correspondence, and for printing a large-sized, handsome sheet, is nnequalled by that of any other American weekly west of the Mississippi.

As a PRACTICAL MINING JOURNAL it has no rival on this Continent.

It is the only MECHANICAL, and the only SCIENTIFIC journal of the Pacific States.

Miners, Assayers, Millman, and Metallurgist in the United States should take it.

Pacific Coast Mechanics, Engineers, Inventors, Manufacturers, Professional Men, and Progressive and Industrial Students should patronize its columns of fresh and valuable information.

Mining Engineers, Snperintendents, Metallurgists, Mine Owners and Mine Workers throughout the world should profit by its illustrations a d descriptions of New Machinery, Processes, Discoveries and Record of Mining Events.

Intelligent thinkers throughout the land, in high or humble situation, who would avoid literary trash for genuine information, should SUBSCRIBE AT ONCE.

DEWEY & CO.,

No. 224 Sansome street, S. F

The Pacific Rural Press,

AN ILLUSTRATED

AGRICULTURAL HOME JOURNAL.

Among other Reasons for Subscribing are the Following:

Because it is a permanent, first-class, conscientious able, and well conducted journal.

Because it is the largest and best agricultural weekly west of the Rocky Mountains.

That Patrons may be fully posted on the progress of the Order in this and other fields.

That more farmers' wives and children in their isolated homes may be cheered by its weekly visits, laden with its pleasing, yet moral reading, and sound instruction.

That a more extended interchange of views and opinions may be had among farmers, upon all the great questions touching their mutual interests and progress.

That the agricultural resources of the Pacific States may be more wisely, speedily and thoroughly developed by an open and free discussion in our columns.

That all the honest industries of our State may be advanced in connection with that of agriculture, our columns being ever open to the discussion of the merits of all progressive improvements.

That the RURAL, after having been read and pondered over by the home circle, can be filed away for future useful reference, or forwarded to the old Eastern fire side of the Atlantic border, in aid of an increasing immigration to our sunny clime.

DEWEY & CO., Publishers,

San Francisco, January, 1875.

Designing and Engraving at This Office.

We are prepared to do fine Wood Engraving for illustrating Landscape Scenery, Buildings, Machnery, Works of Art, Manufactured Articles, Trade Marks, Seals, Etc. We have a first-class

Machine for Engraving

A portion of the work, which can be finished thereby more perfectly than by the eye and hand alone. Our patrons can depend upon first-class work always, and at reasonable prices. Samples can be seen at our office.

DEWEY & CO.

A Good Binder for $1.50.

Subscribers or this journal can obtain our Patent Elastic Newspaper File Holder and Binder for $1.50—containing gilt title of the paper on the cover. It preserves the papers completely and in such shape that they may be quickly fastened and retained in book form at the end of the volume, and the binder (which is very durable) used continuously for subsequent volumes Post paid, 25 cts. extra. It can be used for Harper's Weekly and other papers of similar size. If not entirel, pleased, purchasers may return them within 30 days. Just the thing for libraries and reading rooms, and all who wish to file the PRESS. lanbp

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. L. THARP—San Francisco.
B. W. CROWELL—California.
A. O. CHAMPION—Tulare, Fresno and Inyo Counties.
JOHN ROSTRON—California.
A. C. KNOX, California.
G. W. MCGREW—Santa Clara county.
CHAS. T. BELL—California, Oregon and W. T.
D. J. JAMES—Australian Colonies.
CHAS. T. BELL—Montana, Utah, Idaho and Nevada.

SUBSCRIBERS are requested to examine the printed address on their papers. If mistakes occur *at any time* please report them to this office. The last figures (at the extreme right) represent the year that your subscription is paid to. Next to these the day and month is represented. For instance, your subscription being paid to July 4th, 1876, it would be represented, viz: jnl 4 76; or 4jl76; or jnl 4,76.

UNITED STATES

Mineral Land Laws, Revised Statutes,

And Instructions and Forms Under the Same.

CAMPO, SAN DIEGO CO., CAL., July 3d, 1874.

MESSRS. DEWEY & CO.—*Gentlemen:* To-day I received the patent and other papers of my animal trap, that you so successfully worked through the patent office for me, for which please accept my best wishes. The chances are that I will have another application for you to make for me before long. I am well satisfied with your manner of doing business, and I think inventors of this coast stand in their own light when they do not put their business into your hands.

I remain yours truly, A. M. GASS.

A GOOD PAPER.—The MINING AND SCIENTIFIC PRESS has entered its 30th volume. It grows better as the years roll, and is, without exception, the best paper published for Californla miners and artisans. If such papers were more generally circulated to the exclusion of the sensation trash of the cities, the State would be the gainer in wealth, morals and general intelligence —*Tuolumne Independent.*

Miners and Capitalists.

Assistance is required to develop an extensive Gravel Mine on the richest lead in Sierra County—the above has been thoroughly prospected, and proved to be rich. For further particulars,

Address "B M," This Office.

To Country Printers.

The large drum cylinder printing press, now used in the FAIR DAILY office, in the Mechanics' Pavilion, is offered for sale. It is nearly new, works satisfactorily, and will be sold at a bargain. Address PAINTER & Co., type founders, 513 Clay street, S. F., or the publishers of this paper.

Mining and Other Companies.

Gover Mining and Milling Company—

Principal place of business, San Francisco, Cal. Location of works, Drytown, Amador county, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 3d day of September, 1875, an assessment of ten cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company, No. 402 Front street, room 8, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 11th day of October, 1875, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Saturday, the 30th day of October, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

W. O. WILSON, Secretary.

Office, No. 402 Front street, room 8, San Francisco, Cal.

Keystone Quartz Mining Company—Prin-

cipal place of business, San Francisco, California. Location of works, Butte Township, Sierra county, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on he 22d day of September, 1875, an assessment (No. 5) of fifty (50) cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company, northwest corner Pine and Sansome streets, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the8th day of November, 1875, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 29th day of November, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

LOUIS VESARIA, Secretary.

Office, northwest corner Pine and Sansome streets, San Francisco, California.

Hope Quicksilver Mining Company—Lo-

cation of principal place of business, San Francisco, California. Location of works, Cinnabar Mining District, Sonoma County, State of California.

Notice is hereby given, that at a regular meeting of the Board of Directors, held on the 2d day of August, 1875, an assessment (No. 2) of Five cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, Room 2, No. 408 California street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 9th day of September, 1875, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Thursday, the 30th day of September, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

JACOB HARDY, Secretary.

Office, Room 2, No. 408 California street, San Francisco California.

POSTPONEMENT.—The date of the delinquency of the above assessment is postponed to the 9th day of October, and the date of delinquent sales to November 1st, 1875. By order of the Trustees. J. HARDY, Secretary.

September 8, 1875.

Mount Auburn Gold Quartz Mining Com-

pany. Location of principal place of business, San Francisco, Cal.

54 BUSHELS OF CORN AN HOUR.
HARRISON'S
LIGHT, VERTICAL BURR MILLS
BARBER & BACON, MILLERS AND LUMBER DEALERS, SOUTH VERNON, VT., write July 15th:
"We have been running two of your LIGHT VERTICAL CORN MILLS for the past 6 months with remarkable results, and have ground over 80,000 bushels of corn into No. 1 meal in that time, running the grist-mill nights only, as we run our saw-mill in the day time. We have often ground in the 20-inch Mill (which weighs about 500 lbs.), 1,000 lbs. of corn in twenty minutes, or 54 bushels in one hour. Our usual night's work is about 24,300 lbs., or 434 bushels. To do this we have to run at a speed of 1,300 turns per minute, and use about a 20-horse power. You may refer parties to us for further information, and when we have tested your HEAVY VERTICAL MILL, we shall take great pleasure in giving the results."

The Concentrating Works at Falun in Sweden—Continued.

[Written for the PRESS by CHAS. C. RUEGER.]

III.—The Cleansing and Classing of the "Rubbish Work"—(Germ., Grubenklein).

The rubbish work (sylta) is domped from the railroad cars directly into a hopper of abont 150 cubic feet capacity. Ont of the mouth of this hopper it discharges on to a feed trongh or shoe—a hox 5¼ ft. long and 2 ft. wide, open at top, with sides 8 inchee high. This trough or ehoa is euspended heneath the hopper and to it, by means of foor iron rods. The inclination of the shoe is 20°. Below the head end a compounnd India rubber buffer is attached. An angle of wrought iron is also fastened to the bottom, which, being pushed ont by a cam, compresses the buffer. At tha end of the stroke, on being releaeed by the cam, the shoe is propelled forward against a bntt-bar, which can be adjnsted so as to regulate the length of effective stroke ot the cam. The elasticity or hardness of the blow is regulated by means of a hand wheel, with which the buffer can be compressed more or less. Frrthermore, the quantity of feed can be regulated by means of a gate of sheet iron, attached on the front side of the hopper. Immediately in front of the gate is a water pipe witb spray nozzle, which throws upon the whole width of the shoe so mnch water as to nearly rid the piccea of ore of their coeting of slnm and sand, before they are discharged through a slit in the bottom of the shoe, 20x6 inches, into the cleansing drnm placed beneath. The shoe mekes eighty strokes per miunte, of one-half to three-fourths inch each, according to the quantity to be fed.

The cleansing drnm, *a*, ie conical in form, in common with all other sieve drums, its length being seven feet six inches. Of this, five feet ten inches are allotted to the screen mantle of pnnched sheet iron, having holes of twenty-two mm. diameter. This mantle has the diameters three feet eight inches and three feet two inches. A cast iron coilar at the small or head end, one foot eight inchee in length, is contracted to an entranca of one foot two and a half inches diameter. The steel shaft, three seven-eigbths inches diameter, lies horizontal. The mean peripheral velocity of the drum is 2.6 feet, so that it makes fifteen revolutions per minnte. The screeo clearing or sqnirt pipe, is laid along the ontside of the drnm, for its whole length.

The materia] retained by the drum—the "pick stnff"—is discharged ont of the front end on to a rotatiog, sorting or picking table *a* 1. This has a cast iron ring twenty inches wide, and of ten feet outside diameter, carried by a spider affixed to an npright shaft. The table revolves with a peripheral velocity of six inches per second. This table is snrrounded by a hopper, made of two inch plank, lined inside with inch boerds, and is held together by strong iron hoops. Betwcen the ontside edge of this hopper and the periphery of the sorting table six inches opening is given, so that the workmen surrounding the table can conveniently drop the picked stuff down before them. The hopper has five compartments; the firet, nearest tbe wash drum, receives the "piece ore" (specimens), firstquality, with fifteen to twenty per cent. copper; the second compartment, *piece ore*, second quality, with five to ten per cent. copper, both ready for the smelter; the third, *crush-stuff*, for the rock breaker; and the fonrth, *stamp stuff*, for fine pnlverization in the battery. The barren rock (rubble, deads), which forms the greatest bnlk of the picked stuff, is shoved ioto the fifth compartment by a stationsry scraper.

The assorted stuff is discherged out of the bottom of the hopper, six feet ten inches above the lower floor of the building, into railroed ears; these are lifted by meens of the elevator, *a* 3, to tbe npper floor of the boilding, and their contents discharged into their respective receptacles or hoppers.

With the assistance of twelve hoys, working in twelve-hour shifts, respectively ten and one-half working houre, forty to fifty tons rnbbish-work ore can be washed and picked per day.

The sortiog or picking is best done in contract, in snch way that the picked etnff ie paid for by weight, and in proportion to the percentage of copper—for the rich eorte more, for the peor less.

To effect a nearly eq ial distribution of tha pay, tbe workmen have to change places every dey aronnd the sorting table; this also makes each one expert in the whole work and a jodge of the work of his companions.

As the short days of the winter months have a dnration of only five to six honrs, the sorting for the rest of the time mnst be done by gaslight, which makes the work difficnlt. The rubbish washing works are therefore put to rest for several months of the year, which is also enforced by the extreme cold.

For the classing of the screenings of the wash drnm, sieve drnm apparatus are provided, *a* 4 and *a* 5, which consist of five *classing drums* each. These are of conical form, like the washing drom, but only five feet long; of this, fonr feet fonr inches are allotted to the screen mantle, whose diameters are two feet six inches and two feet. The cast iroa head end collar, eight inches long, is contracted to an entraace opening of one foot six and a half inches diameter. The two and three-eighthinch steel shafta of the classing drums lie horizontal and carry each, on one end, a spnr-wheel of tarea feet diameter; the middle one, moreover, on its longer axis a belt pnlley of four and a half feet diameter, the rotation of which, and the engaging of the gears, canses all tha drnms to revolve simultaneonsly. The mean peripheral velocity of the drnms is 2.1 feet, eqnal to eighteen revolntions per minnte.

To obtain suitable fall, for the transportation of the screenings of one drum to the next following, those of apparatus *a* 4 lie higher above each other, than those of apparatus *a* 5, because the screenings of the first drums are coarser, and therefore requ ire more fall for their transportation sluices.

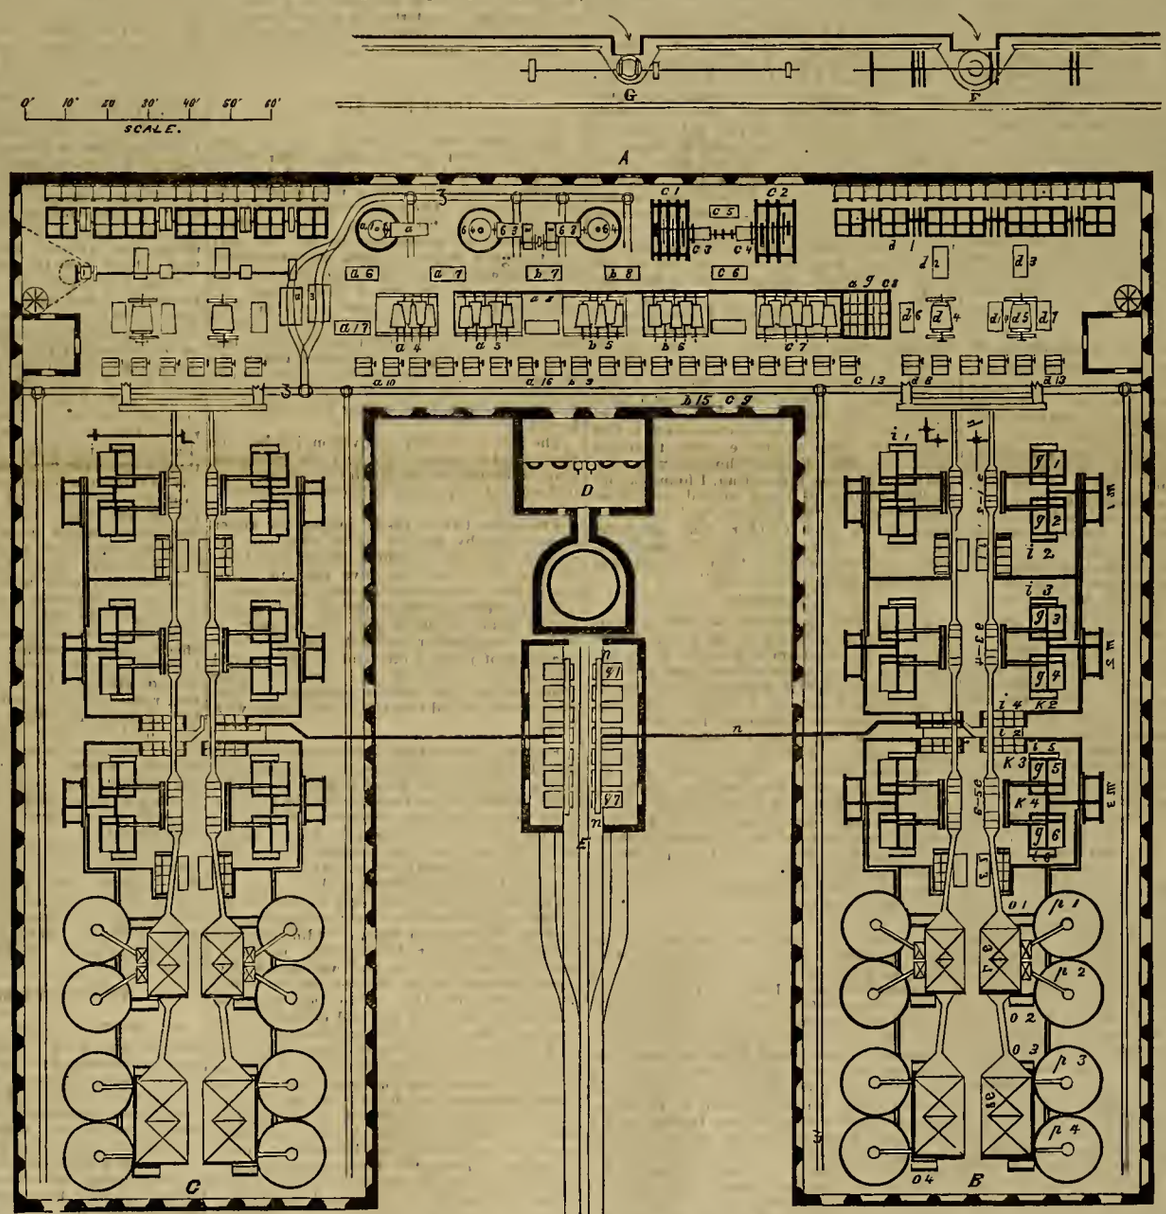
A line drawn from the center of the topmost drum shaft to thet of the third, has an inclination of 60° to the level; a line drawn from the third to the fifth, has an inclination of 40°. The sieve drums of the following apparatns lie in a line of 30° inclination above one another.

The perforations of these sieves correspond exactly with Rittinger'a scale, the coarsest openings being sixteen mm. (millimeter), the finest 0.75 mm.

An external sqnirt pipe, discharging water under high pressure against tbe screens, keeps them open.

The screenings of the wash drnm are raised by a cnp elevator, *a* 6, into the top classing drum of apparatns *a* 4; each drnm retains one

(Continued on Page 252.)



PLAN OF THE CONCENTRATING WORKS AT FALUN.

In the cut *b* 3 and *b* 4 should be *b* 3 and *b* 4; *b* 1 and *b* 2 are omitted; *i* 3, the letter *h* and markings to the letter *e* are engraved back-handed; the characters *i* 1 and *o* 4 should be on the right hand side; the position of the characters *i* 4 and *k* 2 should be reversed.

Plants and Animals Found in the Human Mouth.

According to Dr. C. N. Peirce, in an essay in *Dental Cosmos*, the following variety of organisms is found in the oral cavity, as shown by the microscope: 1. Oidium albicans. 2. Cryptococcus cerevisiæ. 3. Leptothrix buccalis. 4. Leptomitus. 5. Bacteria, vibrios, and monads. 6. Paramecia. 7. Heterogeneous mass.

Oidium Albicans, or While Plant.

As revealed to the obeerver, it seems to consist of thickened epithelial cells, mingled with nnmerous minuto sporules or seeds, from the midst of which long, thread like, jointed and branching plants arise, mycelium, intertwining with each other. The question as to whether this vegetable growth is the origin or soquence of disease hsa not yet been settled. So far as I can learn of its prevalence or predisposition, it occnrs most frequently in the mouths of persons living in situations where tbe air is impnro and diet unwholesome, or where previous gastric or intestinal disorder bas interfered with the health and vigor of tho infant. It is found alone or simultaneously on the inner edge of the lips, where the mucons membrane begins, on the inner side of the cheek, on the gums and palate, on the upper and lowor surface of the tongue, in the throat, and in tbe œsophagus, down as far as the cardia, or upper opening of the stomach.

Cryplococcus Cerevisiæ—Cell or Capsule.

This plant is composed of round or oval cells, which present in their interior oue or two little corpuscles resembling somewhat an oil globule. They are propagated with great rapidiiy when in contact with decomposiug substances at a favorable temperature. This cryptococcus is so similar to that fonud in yeast, beer, ale, and sour milk that it may bc considered practically identical, the principal difference noticed being a variation in the aize; while in sbape, manner of propagation, and apparent globule within, the modifications are but slight. It is developed in the morbid secretions of the mouth, the œsophsgns, and stomach; it is also introduced into these situations by the drinking of beer.

In the black fur of the tongue of persons laboring nnder typhus, or in the oral secretions where persons have been long snfferers from organic disease, it is also found. Vogel thinks it of great importance to regard this plaut only as an accompaniment and not as the cause of diseaee.

Leptothrix Buccalis—Slender Hairs in Ihe Mouth.

This consists of slender structureless fibers, of various lengths, and straight or cnrved as the fiber is long or short. One end is free, the other is planted in or projecting from a granular mass, though a limited number are always noticed floating in the secretions, detached from any snbstance. They are fonnd singly or in bundles, and multiply with great rapidity. Scarcely any portion of the mouth is free from them. They appear on the snrface of the tongue, in dopressions of the teeth, and cavities of decay, on the neck and surfaces of the teeth; indeed, everywhere within the oral cavity tbat lodgment can be found for a particle of food.

They are fonnd also growing from the surface of accnmulations of tartar, whether such accretions be upon the necks of the teeth, in the cavities of decay, or on artificial dentures. There is probably no situation where they grow with greater rapidity than on the surfaces of tbe palate, either upper or nnder. The soft cheese-like substance that so quickly accumulates there is most prolific in their production, thongh from this situatiou they are neither so long nor attenuated as those taken from an inflamed mucous membrane. While great care in cleanliness limits their number, it is impossiblo to entirely eradicate them or prevent their development.

Leplomitus—Slender Threads.

This growth, as the name indicates, is neither so long nor so slender as the leptothrix. It also has occasional branches, and marked transverse striæ, which complete ite morphological difference from the plant just described. It is found npon tho tongue and in the pharynx of persons suffering from pneumonia, pleuresia, phthisis, apoplexia, and cbronic gastritis.

Bacteria and Vibrios.

These organisms form some of tbe most minute objects which the microscopist bas the opportnnity of examining, and it is with the greatest difficulty their strnctnre can be accnrately determined. They are found in the fluids of the mouth, but the profusion in which they exist is modified by the care exercised in keeping the fluids of the oral cavity free from decomposing substances. In the lungs of teeth where the pulps are devitalized, they are found to rapidly develop. Nor is their presence in this locality confined to such teeth as have defective crowns giving communication with the fluids of the mouth; but in a number that were examinod where there was a devitalizatiou of the pnlp, without any loss of the hard tissues from caries or otherwise, their presence was readily detected. Upon opening into such cavities, they were, as nsnal, very offensive from the degeuerated pulp, aud ou examining this putrid material those living organisms were observed in abundance.

Monads.

With those two low forms of life we must associate what are kuown as monads, or, as Bastian calls them, plastide particles. These are invariably found in the same solutions with the former, and are supposed by some observers to result either by direct growth and development, or by aggregation and coalescence into bacteria and vibrios.

"Naturalists have beeu in donbt as to whether they should be regarded as independent living things of the lowest grade, having an individuality of their own, or whether, rather, they should be looked upon as developmental forms of some higher organisms, either aniinal or vegetable.

The discovery of these low forms of life in the month is not of modern origin, as we shall see from the following by Lenwenhoek. In 1682, at the age of fifty years, he wrote respecting his teeth: "It is my custom every morning to rub my teeth with salt, and afterwards to wash my mouth, and, after eating, I always olean my large teeth with a toothpiok, and sometimes rub them very hard with a cloth. By these means my teeth are so clean and white that few persons of my age can show so good a set; nor do my gums ever bleed, although I rub them very hard with salt, and yet I cannot keep my teeth so clean but that, upon examining them with a magnifying glass, I have observed a kind of white substance collected between them, in consistence like a mixture of flour and water. In reflecting on this substance, I thought it probable (although I could not observe any motion in it) that it might contain some living croatnres. Having therefore mixed it with rain water, which I knew was perfectly pure, I found, to my great surprise, that it contained many very small animalcules, the motions of which were very pleasing to behold. The largest sort of them had the greatest and qnickeat motion, leaping about in the fluid like the fish called a jack; the number of these was very small. The second sort had a kind of whirling motion, and sometimes moved in the direction of a spiral, and undulated; these were more in number. Of the third sort I could not well ascertain the figure, for sometimes they seemed roundish but oblong, and sometimes perfectly round. These were so small that they did not appear larger than a speck. The motion of these little creatures, one among another, may be imagined like that of a great number of guats or flies sporting in the air. From the appearance of these to me, I judged that I saw some thousands of them in a portiou of liquid no larger than a grain of saud, and this liquid consisted of eight parts water and one part only of the before mentioned substance taken from the teeth.

"With tho point of a needle I took some of the same kind of substance from the teeth of two ladies who I knew were very punctual in oleaning them every day, and therein I observed as many of these animalcules as I have just mentioned. I also saw the same in a white substance taken from the teeth of a boy about eight years old; and npon examining in like manner the same snbstance taken from the teeth of an old gentleman, who was very careless about keeping them clean, I found an incredible number of living animalcules, swimming about more rapidly thau any I had before seen, and in such unmbers that the water which contained them (though bnt a small portion of the material taken from the teeth was mixed in it) seemed to be alive."

Paramecia.

Having uow considered all tha growths deemed vegetable fonnd in the moutb, I have still one other organism to describe, as to the true place of which in nature there is no division of sentiment, it belonging undoubtedly to the animal kingdom. I allnde to the paramecia, a genus of infusoria. They are only fonnd in the oral cavity in casee of extreme uncleanliness; and thongh increasing rapidly in infusions adapted to their growth, they are somewhat limited in this sitnation, owing to the constant changes of the secretions. Abont fifteen varieties have beeu described. They have a soft, flexible body, variable in form, though nsually oblong or oval, and more or less depressed. In most of them, numerous rows of vibrutile cilia are noticeable, projecting from their integument.

New Safety Lamp.—At a meeting of the North Staffordshire mining institute, held recently at Stoke-on-Trent, a paper was read on "Landan New Safety Lamp, for Use in Mines." The peculiarity of the lamp is that the admission of gas extinguishes the flame, and it cannot under any circumstances be exploded by the lamp. The whole of the air for feeding the flame has to paes through an air chamber in a limited space at the bottom of the lamp, and as soon as the impure air, such as hydrogen, fills np that limited space, then the passage for the oxygen which is requisite to support combustion is stopped, and consequently the light gets suffocated for want of air. Successful experiments were made to demonstrate this. It was claimed for the lamp that it could not be affected by the strongest current of pure air; but the experiments in this respect were not so successful. But while these latter experiments did not show that the Landau lamp was inferior to others, the former were regarded as the evidence of superiority of construction.

A New Substitute for a Barometer.—One who has tried says a cnp of coffee is a sure barometer, if you allow the sugar to drop to the bottom of the cup and watch the bubbles arise without disturbing the coffee. If the bubbles collect in the middle, the day will be fine; if they adbere to the cup, forming a ring, it will be rainy; and if the bubbles separate without assuming any fixed position, changeable weather may be expected.

Engineering Experiment.

About twenty gentlemeu, including Major J. Tunstall Haverfield, Mr. Cruger Miles, Mr. Mnir, C. E., Mr. Yockley, C. E., and others, paid a visit to the docks at Avonmouth, Bristol, on the 2d inst., for the pnrpose of inspecting an engine, adapted by Mr. Haudyside for ascending steep gradients ou railroads. The patent had been viewed on Monday week by Sir John Hawkshaw and other members of the British Association, but on that occasion, owing to some disarrangement, the winding gear could not be worked. On this occasion, however, the whole of the capabilities of the engine were shown. The principal idea of the invention is the conversion of a locomotive into a stationary engine by the action of two gripping struts placed on either side at the end of the engine. In the framework of the latter is fixed a hauling drum about one foot in diameter, round which is wound a wire rope. At the foot of a steep incline this wire rope is paid out, and the engine ascends by itself. When a sufficient distance has been traversed the engine is stopped, and the gripping struts, holding firmly to the rails, allow the train to be drawn up by the rope as if by an ordinary stationary engine. The powerful gripping action of these struts was shown by their not yielding when the full force of steam was worked directly against them. When descending an incline they act as brakes, and are capable of stopping a train travelling forty miles an hour, in 370 feet. It is said that the Secretary for War has informed Mr. Haudyside that if the engine is a success at Avonmouth for a fortnight, a royal commission will be sent to inquire into its merits with a view to its application to field service.—*Engineering Times.*

The Jujube Tree.

The jujube tree, (*Rhamnus Ziziphus*) has been introduced into Louisiana over thirty years, and though it thrives as well here as in Syria, its original country, it is known only by few persons. The jnjnbe is an elegant tree, of medium size, fifteen feet, accommodating itself to any soil, provided it be not too wet; and though a native of Syria, does not snffer from any amount of cold we are ever liable to experience in the latitude of New Orleans.

The fruit of the jujnbe tree ripens in July and Angnet, and is of the size and shape of a large olive, covered by a red smooth, thin, but hard skin; the pulp is soft yellowish and sweet; in the centre of the fruit is a hard stone, which contains two cells or cavities, one of which is generally obliterated; the other contains an oily kernel.

The jujube, through cultivation, has become naturalized in Spaiu, Italy and the Southern part of Fraunce, where its fruits are used in making that preparation so familiar to children, "jnjube paste."

The jujnbe tree is easily propagated either by seeds, or by auckers which rise from its roots at distances of eight to fifteen feet from the tree. The seedlings give fruit in aix or seven years, the suckers in one or two years.

The inventive genius of the age uow makes jujube puste of gum arabic, sugar, water, a little coloring matter, and not a particle of the decoctiou of jujnbe fruit—and yet our medical dispensatories, though acknowledging the fraud, tell us the modern jujube paste is as good as that of old times; I cannot agree with them.

Restoration of Life After Freezing.—A friend residing in Baltimore had in his possession a small alligator, which had been sent him from Florida; its habitation was a tub partially filled with water, kept ontdoors. During one of the cold anaps of the past wiuter, in the night the water became oompletely frozen, imprisoning the reptile in the ice, with but a small portion of his body protrnding therefrom. To all appearances the animal was as dead as one of the stuffed specimens seen in a mnseum collection. The want of time preoluding an effort for its extrication in the morniug, it was allowed to remsin frozen, and was soon forgotten in the maze of the cares of the day. For forty-eight houra the reptile thus remained frozen and lifeless, at the end of which time, on being thawed ont, vitality became visible, and in a short time it was as animated as ever, with no evidence of having in the least snffered by the prolonged frigorific confinement. Here is an inatance in which the vital spark seems not to have been extinguished by the freezing, nor the animal's organism to have been mutilated, but that vitality merely remained torpid or dormant dnring the freezing, and ready to respond to its functions whenever the animal's organism returned to its normal condition.—*Ex.*

The Foreign Debt of the United States has been estimated by bankers in New York, who have the anbject constantly before them, to be as high as $2,000,000,000. Thia debt is an immense drain npon our resources. It draws from us a vast portion of the profits of labor and capital at home; it takes away the entire product of our gold and silver mines, and it keeps us constantly exporting enormous domestic products without any adequate remuneration. This large foreign debt we oan only get rid of by maintaiuing a favorable balance of trade, for which a protective tariff ia indispenaable, and we must, at the same time, exhibit inoreased enterpriae in the export trade and a discouragement of the growth of luxury.

Carbonic Acid for Extinguishing Fires.

The several portable fire extiuguishers, which are now in such common nse, and which have done snoh admirable service, are founded on the use of carbonic acid gas as the extinguisher, and have fully demonstrated its practical value. We, some time ago, called attention to the advantages that would result from the nse of this same agent in extingniahing fires on shipboard, and in the firey mines of the anthracite region. The portable extingnishers have done good service in several of our coal mines, bnt the chief difficulty in using them in a confined space is, that they quickly make tbe air irrespirable, and may cause suffocation of the operator, even before the gas has filled the whole space snfficient to extingnish the fire. And, also, it is impossible to approach a large fire close enough to obtain the full effect of the gas on it. Messrs. Connelly & Naylor, of Pittsburg, have applied the gas in a manner which produces the most satisfactory results, and which may be extended to use in the coal mines. Some of our mines now have water pipes laid into every gangway, and branches of portable hose into each breast, in order to combat the fires that are ignited, almost daily, from the blasts. Experience in the managing of the water has made this agent a reliable and moderately efficient one, but we think it highly probable that greater certainty and efficiency would be secured in the use of carbonic acid. In order to give some idea of its prompt and effective action, we take from the Pittsburg *Commercial* the following description of some interesting experiments with it at Pittsburg:

"The patentees recently fitted up an apparatus, near the grounds of the gas works, in Pittsburg, where they coudnoted experimental tests in the presence of a number of citizens. In general terms, the machinery consists of a generator, where the gas is evolved; three receiving tanks, thirty inches in diameter by ten feet in length, and the counecting pipes. Fifty feet distant waa an excavation, twenty by thirty feet, filled partially with water, upon the snrface of which was a 'skim' of crude oil, to test the efficacy of the gas in extinguishing an 'oil fire.' A pipe about an inch and a half in dismeter, and supplied with small jets every few inches, was extended along each side of this tank, a little above the surface of the water.

"Tbe first experiment consisted in lighting the crude oil, and letting it burn until the flame covered the entire surface. Immense volumes of black smoke rolled upward, the flames shot np ten or twelve feet into the air, and the heat was so intense as to drive the spectators back some fifty or sixty feet. At a signal from Dr. Connolly, when the fire was at its hotteat, the engineer turned a valve, tbe carbonic acid rushed from the receivers, with a hissing noise, throngh the jets in the pipes, and in two or three aeconds the flame was cnt off as effectually as thongh a coating of ice had instantly formed on the snrface of the oil. As aoon as the gas struck the flame, it was changed to a white steam, which made a striking contrast with the dense black smoke above it, as these two dissimilar vapors floated away and were gradually dissipated in the upper atmosphere. The second experiment was but a repetition of the first, and in both cases the extinguishment of the great volume of flame was as sudden and effectual as the snuffing ont of a candle. A third experimeut conaisted in aetting fire to a pile of ehavings, kindling wood, oil barrels, etc., rendered highly inflammable by the addition of crnde oil. When the fire had taken a firm hold, and was rapidly consuming the woody fibre, the gas was trned on, and the fire was out. The wood continued to smoke for a few moments, but there waa uo fire. The experiments were highly snccessful, and Dr. Connolly was warmly congratulated on his achievement.

"The pressure on the receiving tanks, at the first test, was: No. 1, 210 lbs.; No. 2, 115 lbs.; No. 3, 213 lbs. No. 2 was really not in use. On the second test, the pressure was 180 lbs. on Nos. 1 and 3. Theee tanks, or boile.s, were made by Messrs. Carroll & Co., and are the best steel, put together as tight as joints can be made."

Utilizing Furnace Slag.

Mr. W. Harold Smith, of Philadelphia, has been experimenting for some time with furnace slag, endeavoring to make from it a cheap and serviceable substitnte for bricka and atone in paving and buildiug. He haa taken slag from the furnace, granulated as it came from the stack, then mixed it with two-thirds its weight of cement, subjected it to heavy pressure, and baa succeeded in making firm, smooth, solid blocks, whioh have sustained the following tests: (1) They have been very highly compressed without orushing; (2) were laid for pavement last year and endured the winter's frost without damage; (3) have been heated to a white heat and then thrown into water without disintegration; (4) a thirty-five-foot column of water was forced against one of the blocks without penetrating it; and (5) they were found to endnre heat which would melt an ordinary red brick. Mr. Smith proposes to make use of his invention first in the manufactnre of stones for flagging pavements, from fifteen to twenty-four inches square and three inches thick, and afterwards, when the valne of the material beoomes manifest, to utilize it in other forms. He claims that his stone, which he has named "Phœnix stone," can be made so oheaply that a furnace owner can make aa much ont of alag as he can out of his iron.

MECHANICAL PROGRESS.

The Nature and Utilization of Slag.

Frederick A. Luckenbach recently addressed the New York Society of Practical Engineering, on "The Industrial Uses of Blast Furnace Slag." The main points of his paper were as follows: Slag is a chemical compound, the combination of an acid with various bases, and is as much a salt as the sulphate of alumina or potassa. Its formation is strictly governed by the laws of chemistry. The silica is the acid, and the lime, alumina, magnesia and the alkalies are the bases. Iron ores are generally silicious. If when an ore is placed in a blast furnace and smelted, no base is added, in seeking a base the ore will seize on the oxide of iron combine with it and carry it off as a slag. To prevent this, limestone, which is a base, is added. A certain quantity of silica requires a certain amount of lime to saturate, another quantity of magnesia, and another of aluminum; all of which quantities will vary with their chemical equivalents. Having, then, analyses of all the material of the charge, the proportions of each may be so calculated as to produce a certain slag. But with slag, as with other chemical compounds, there may be two atoms of base to one of acid, two of acid to one of base, or one of base to one of acid: and, according as this is the case, they are called basic, acid or neutral slags. The acid slags are the most fusible, the neutral next, and the basic the least so. Slag is sometimes, according to the proportions of its component parts, a material easily fusible, and possessed of other definite qualities, and at other times a comparatively infusible material. Such being the character of the product, it has been a problem of great difficulty to determine what general system can be built upon which for any given purpose will utilize all the different varieties of slag.

The first recorded plan for the utilization of slag was that of John Payne, in England, in 1728. He proposed melding the dross by fueing or melting with such mixtures as will prevent its being brittle, and also give it different colors, so as to make it more ornamental and useful. After this came Mushet's plan of 1815, for reworking slag to obtain the iron left in it. Then Crawshay and Mushet invented a process for recovering the iron believed to exist in the refuse of copper smelting, which process appears to be the first use of water for pulverizing molten slag. In 1852, Alexander Cunningham claimed that sulphate of alumina and alum could be obtained from slag. In 1853, William and John Longmaid thought that blast-furnace slag could be formed into shapes suitable for pavements of streets. In the same year George Robinson proposed a new plan. The slag was to be run in a molten state upon a heated iron table and formed into sheets by rolling. The plates were then to be annealed and applied for roofing and other purposes. In the following year, Smith, Bessemer & Longsdon secured a patent on a process in which slag was turned into table tops, chimney pieces, statues, etc. Joseph Woodward, of Yorkshire, patented a process for making bricks of slag for building purposes. A company of capitalists have lately begun to make bricks by this process. Their prospectus asserts that the brick will withstand a crushing force of over four tons per cubic inch, being five times more than ordinary brick will bear. All these projects have proved failures. The secret of securing homogeneity in structure, irrespective of chemical action, was not discovered, although the process of annealing gave a faint and shadowy hint of the direction in which it might be found. Mr. Luckenbach read the details of an invention of his own, which he claimed to be an improvement in the means of unhealing castings made of blast-furnace slag, and which is designed to provide for the manufacture of paving and building blocks, fire-brick and other articles from the slag.

THE EXPLOSION COMMISSION.—At the recent meeting of the Government steam boiler explosion commission at Sandy Hook, the boiler experimented upon was a plain cylinder boiler, set in brickwork in the usual manner. In each experiment the boiler was filled with water, and when the fire was in good order and the steam at the right point, all water was blown out; the boiler was allowed to become heated to the desired temperature, as indicated by a pyrometer inserted within it, and, at the proper moment, the feed water was introduced by a force pump. It was only on the second day that this severe usage produced the destruction of the boiler. At each occasion, on the introduction of the water, the steam pressure jumped up suddenly, the safety valve opened, and, the water still continuing to enter, the boiler pressure dropped almost as rapidly as it had risen, and the boiler cooled down on each occasion (except the last) without any apparent injury, and without having even started a seam, although the metal had been red hot. The last experiment resulted in the explosion of the boiler and the destruction of its setting, and interrupted the work. The succession of phenomena was precisely as already described; but the temperature of the boiler was higher, probably a bright red on the bottom, and the pressure of steam was about sixty pounds when the explosion occurred. It had fallen somewhat from the maximum attained the moment before. From these, and similar experiments yet to follow, those having the management of steam boilers will draw their own conclusions. One thing is made apparent, that no boiler—no matter how good the material, nor how perfect the workmanship—can long withstand the pressure resulting from the sudden introduction of water upon overheated plates; hence, low water is a source of danger which engineers should always avoid.

Depression in the Iron Interest Due to the Increasing Introduction of Steel.

The Cincinnati *Times* has the following: The continued depression of the iron interest, not only in this country but in Europe, is a subject for thoughtful consideration. The wonderful growth of the iron production of the world from 1835 to 1865 marked it emphatically as the iron age, and during that period was built almost our entire present system of railroads, covering over 73,000 miles of track, and requiring fully 7,300,000 tons of railroad iron in its construction. The annual wear and tear, estimated at about ten per cent., would require 730,000 tons per annum of railroad iron.

Since 1865 Bessemer steel rails have been growing in favor and decreasing in cost, and to-day the Bessemer plants of this country are capable of producing 350,000 tons of steel rails per annum. When it is remembered that each steel rail possesses fully seven times the life of an iron rail, is it to be wondered at that so many of our iron rail mills are changing their production to merchant bars? Every ton of Bessemer steel rails that has been put into the railroads of the country for the past ten years has possessed a wearing life, as compared to iron rails, as seventy to ten. It requires very little calculation to estimate the required production of steel rails, not only to cover the entire wear and tear of all our iron roads, but in a few years to replace our iron roads with steel rails.

When this is accomplished there will only be required 73,000 tons per annum to supply the wear and tear that in 1865 required 730,000 tons of iron. This will account in part for the decreased production of pig iron in the country for three years past. In 1872 there were produced 2,854,558 tons of pig iron; in 1873 2,869,278 ton; and in 1874, 2,689,413 tons, a falling off of about sixteen per cent. in the production of pig iron in two years. This was fully equalized by the low wear and tear of steel rails that had gone into the railroads since 1865.

We are now entering on the steel age, and the iron men of the country must meet the question firmly, understanding not only that the market for railroad iron is almost at an end, but that whenever Bessemer steel supplants the use of wrought iron, it not only requires less weight for a given result, but that, the life of steel being so much longer than iron, the wear and tear will be proportionately less. England, France and Belgium have already recognized the sovereignty of the "new metal, "Bessemer," and are now changing their works to meet the emergency. Shall our iron and steel men, with their justly won laurels for the great production with the Bessemer plants, allow others to step in and rob them of their glory?

AMERICAN TOOLS IN ENGLAND.—English edge tool makers in particular are aware of the success with which certain of their business rivals in America have has led them in many of our home and foreign markets. So large, however, is the demand at present for good edge tools of almost every description that there few edge tool firms in the United Kingdom who have not got plenty of orders upon their books. The English article is not, therefore, out of use, but there is a perceptible increase in the favor in which handy and thoroughly excellent tools are held both at home and abroad. And this is being encouraged by the growing facilities for manufacturing steel, both shear and cast. Sensible of this, certain American firms are pushing their opportunity. Hence it comes about that American forks, shovels, and axes are to be had wherever edge tools are offered in this country. But it would seem that the Americans believe that they can compete with us much more successfully by having branch establishments to manufacture their specialties in this country rather than by shipping their product from the other side. A firm of cast-steel shovel makers at Pittsburg (Messrs. Hussey, Binns & Co.) who have recently brought out a shovel in which the straps, though of iron, are compacted with the steel during the process of casting, and who are making at a very low figure, and with very little manual labor, shovels that are getting very rapidly into use throughout the States, are now, through a representative who has recently come over from Pittsburg to England, making enquiries which will regulate their action, and determine them whether they will themselves begin to make in this country, or whether they will offer their process to English firms, or an English company. If American edge tool makers should begin to produce here goods that are already running English makers hard, then it is to be inferred that their example will be followed by other Trans-Atlantic hardware manufacturers. If, in such an event, the English firms will keep as well employed as they now are, is another matter.—*London Mining Journal.*

SCIENTIFIC PROGRESS.

Molecules.

The term atom has been exclusively appropriated by the chemist, while the mathematician and physicist have preferred to adopt, or share with him, the word molecule to signify those ultimate constituents of matter upon whose motions and relations depend the various states of all bodies, solid, liquid, and gaseous; their temperature, and other properties.

The word particle is also freely made use of as involving no hypothesis, and meaning simply a small part of any body. Molecule has been defined by Maxwell as "the smallest possible portion of a particular substance;" and again, as "that small portion of the substance which moves as one lump in the motion of agitation."

Every substance is now supposed to be composed of an immense number of molecules, which, even in the solid state, are never entirely at rest, and, in the gaseous, are in a state of perpetual violent commotion, rushing about in straight lines in all directions with inconceivable rapidity; and it is this perpetual bombardment, as it has been called, by these little particles, that explains the known pressure of gas on the walls of any containing vessels, the incessant impact of the molecules producing the effect of one continual pressure, just as upon the eye a succession of rapid flashes of light have the effect of one continuous flame. Of course the molecules, although they are supposed to be separated for a very considerable distance from one another, are perpetually meeting and rebounding, and thus their velocity is interfered with, but there is a certain residuum of speed left, resulting in a mean velocity for the whole. This mean velocity indicates also temperature, and, for the same substance at one pressure, the same mean velocity is always accompanied by the same temperature.

But every different substance has a mean velocity of its own for a given temperature, and these have all been calculated, such is the extreme nicety with which the hypothesis is being worked out. Taking, for instance, one of the constituents of water—hydrogen—in the form of gas its mean velocity has been calculated by Joule at over a mile in one second—a speed far greater than anything we have any practical knowledge of—far above that obtained in artillery practice. The exact velocity is 6,097 feet per second, at a temperature of 32° F., and at the ordinary pressure of the atmosphere.

A daring attack has been made upon the actual size of the molecules with a result that has every element of probability in its favor. Thompson has calculated that a cubic inch of gas contains a hundred thousand million million million molecules. To convey some idea of their magnitude, he says: "If we conceive a sphere of water as large as a pea magnified to the size of the earth, each molecule being magnified to the same extent, the magnified structure would be coarser grained than a heap of small lead shot, but less coarse grained than a heap of cricket balls."

A SHOWER OF HAY.—Dr. Hawtrey Benson, of Dublin, writing in the Dublin *Daily Express* under date of July 27th, describes a remarkable shower of small pieces of hay which he witnessed at Monkstown that morning. It appeared in the form of "a number of dark flocculent bodies floating slowly down through the air from a great height, appearing as if falling from a very heavy dark cloud, which hung over the house." The pieces of hay picked up were wet, "as if a very heavy dew had been deposited on it. The average weight of the larger flocks was probably not more than one or two ounces, and from that all sizes were perceptible down to a simple blade. The air was very calm, with a gentle undercurrent from S. E.; the clouds were moving in an upper current from S. S. W." The air was tolerably warm and dry, and the phenomenon is thus account for by Dr. J. W. Moore: "The coincidence of a hot sun and two air currents probably caused the development of a whirlwind some distance to the south of Monkstown. By it the hay was raised into the air, to fall, as already described, over Monkstown and the adjoining districts." A similar shower of hay fell near Wrexham, England, July 25th.—*Scientific American.*

COLLODION.—Few bodies are more easily electrified than collodion. With the least friction by the hand, the membrane adheres to the fingers. If a collodion sheet be fixed, like a flag, to a glass tube, and waved in dry and hot air, it is electrified. Other uses of collodion sheets, here mentioned, are in experiments on polarization of light, on colors of thin films, on diathermancy, on vibrations in acoustics. M. Gripon prepares these sheets by dissolving 1.5 to 1.7 grains gun cotton in a mixture of fifty grains alcohol and fifty grains ether. The collodion is poured on a glass plate after the latter has been breathed upon so as to receive a coating of moisture. When—after some hours—the collodion is dry, the plate is put in water, and a sheet of paper having been applied and attached to the collodion by the edges, the film is drawn off with the paper.—*Scientific American.*

A Water Shell.

The *Scientific American* calls attention to some interesting experiments which have recently been made at Okehampton, England, which have been very successful in proving the great value of the new water shell, which will at once be adopted as a service weapon. The effects of this novel instrument of warfare surpass in destructive power the renowned shrapnel shell; and in one experiment when a battery of the Royal Horse Artillery was in action, as many as fifty-one hits were recorded with the new shell, against twenty-eight made by the shrapnel, fitted with time fuses. The wooden dummies, which represented the enemy drawn up in loose order, one pace apart, in the manner of an advancing army, were struck again and again by the minute fragments of the water shells, which, according to our correspondent, inflicted wounds of a far more dangerous nature than those made by the shrapnel or common shell.

The nature of the water shell may be explained in a few words. It is not a projectile of special construction, but simply a common shell or cast iron cylinder filled with water, into which is fitted a small cylinder containing a quarter or, at the most, half an ounce of gun cotton; it is then hermetically sealed; a few grains of fulminate of mercury is placed between the gun cotton and the fuse, and, as soon as the latter is fitted, the shell is ready for firing.

The charge of gunpowder used in the same sized shell is sixteen ounces, the explosion of which breaks the shell up into three or four pieces, whereas the one charged with half an ounce of gunpowder flies into a hundred or more fragments. The reason is this: The gunpowder explodes comparatively slowly, and breaks up the shell at its weak points, while the gun cotton detonates with a sudden and terrible force, which, being communicated to a non-compressible body (water), bursts the shell instantly into minute fragments, the energy being exerted equally on all sides. So rapid and terrible is the force generated by the gun cotton that the iron shell is sometimes pulverized, the fragments of metal being so minute as scarcely to be visible.

The idea of this terrible shell is due to Professor Abel, who is the patentee of a process to manufacture gun cotton. The English, German and French governments have adopted this new form of gun cotton for torpedoes and shells, as well as for military engineering and submarine mining.

THE POWER OF ORDINARY WIND EDDIES.—The Faribault (Minn.) *Democrat*, in a late issue, relates the following: "A farmer who lives about five miles northwest of Faribault, by the name of Samuel Johnson, was going along the road Saturday last, when suddenly a little whirlwind, which described a circle apparently not more than three feet in diameter, appeared in the road in front of him. It took up the dust pretty lively and buzzed like a swarm of bees, but Mr. Johnson kept on his way directly towards it, thinking it had no great amount of power. In fact, he did not think it worth his while to step one side and let it whirl past, but kept straight on and met it square in the road. When they came together the whirlwind seemed to drop everything else and took hold of Mr. Johnson, and in less time than it takes to tell it, Mr. Johnson had lost his hat and his shirt, and was pitched about twenty feet into the gutter, feeling as though he had been shocked by a battery. It was a rough experience, and Mr. Johnson will never fool with a whirlwind again."

AN EXPERIMENTAL AURORA.—M. Lynström, of the University of Helsingfors, has sent to the Geographical exhibition, Paris, an interesting instrument invented by him to demonstrate that aurorae are produced by electrical currents passing through the atmosphere in the polar regions. The instrument is very simple and effective in its demonstrations. The phenomena produced are quite consistent with the theory advocated by Swedish observers, that electrical currents emanating from the earth and penetrating the upper regions produce aurorae in both hemispheres. The experiment, says *Nature*, differs from the apparatus of M. De la Rive, who placed his current *in vacuo*, and did not show the property of ordinary atmospheric air of allowing to pass unobserved, at the pressure of two feet six and one-half inches, a stream of electricity which illuminates a rarified atmosphere. The experiment was most attractive, and hundreds of persons witnessed it every day.

BALLOONING AT NIGHT—OBSERVING METEORS.—M. Wilfrid de Fonvielle made a successful night ascent on August 1st, for the purpose of observing meteorites. From 10 P. M. to 4 A. M., forty-two meteorites were observed between Rheims and Fontainebleau. Some of these emanated from *Cassiopeia* others from *Perseus*, and as many as nine took a vertical direction, descending from the part of the heavens which was concealed by the balloon. None of these were very noteworthy, and it is probable that none would have been observed at the surface of the earth. Eight persons were in the car.

"EOSIN" is the name given to a new coloring matter recently introduced into commerce. It was first produced by Caro at the Baden aniline works, and named by him on account of its beautiful color, eos, the red of the morning dawn.

The Mining Share Market.

The mining share market has generally been marked by an improvement during the week, and the last few days has shown considerable strength. There was an advance in the leading stocks yesterday, which looks as though it might be permanent. Prices on the street this (Thursday) morning were about as follows in the leading stocks: Ophir, $65 bid, $65¼ asked; Mexican, $22⅜ bid, $22½ asked; Best & Belcher, $49¾ bid; Gonld & Cnrry, $19¼ bid, $20 asked; Overman, $45 bid; Jnstice, $31 bid; Con. Virginia, $300, sales.

We note assessments in this week's issne as follows: Mansfield, Savage, Union Consolidated, Baltic Consolidated, Baltimore Consolidated, Overman, Rock Island, Excelsior, and El Dorado.

The news from the mines is of an encouraging character, and fully justifies a steady and advancing market.

A NEW OLEAGINOUS SEED.—The commission of the permanent Exposition of the French Colonies has lately called the attention of Marseilles soap makers to a new source of oil, found in the seed of the csraps, which is a tree abounding in immense forests in French Guisna. Twice a year the tree produces an abundant harvest of seed, which at certsin times cover the esrth to a depth of four or five inches. These, immediately snbjected to pressure, give thirty-five per cent. of their weight in an excellent soap-making or illuminating oil.

THE long cnt, which is to snpply the Central California colony, at Fresno, and the Wheatville farmers with water is now finished, and the wster is running through it.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington D. C., Oct. 12th, 1875.

FOR WEEK ENDING SEPTEMBER 28TH, 1875.*

BEER FAUCET.—Adolph L. Bobet, S. F., Cal.

BLEACHING SOAP.—Peter Burns, S. F., Cal.

VEHICLE SPRING.—Robert Walker, Oakland, Cal.

BED BUG TRAP.—Edmnnd G. Watkins, Georgetown, Cal.

*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

MINING SHAREHOLDERS' DIRECTORY.

Compiled every Thursday from Advertisements in the Mining and Scientific Press and other S. F. Journals.]

ASSESSMENTS.—STOCKS ON THE LIST OF THE BOARDS.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

California.

ALAMEDA.

A GOLD AND SILVER LEDGE NEAR HOME.—Alameda County *Independent*, Oct. 9: Our readers will be surprised to learn that a real quartz ledge, containing silver and gold, has been just discovered in the low range of hills east of Dunbarton point and north of Newark, in Alameda county. Experts familiar with the famous Comstock lode have examined this ledge, and pronounce it a genuine vein, and much wider than the rich leads in Nevada. The croppings have been assayed in San Francisco, and yield enough to warrant the expectation of a paying mine. Some of the owners of land where the ledge runs, with whom we have talked, are quite sangnine of having a "good thing." They will go to work and develop their mine forthwith, so that the results, favorable or otherwise, will soon be made public.

AMADOR.

MILLS CLOSED.—*Foothills Ensign*, Oct. 8: On Thursday of last week the Lincoln company discharged all their hands at the mine and mill, with the exception of two or three who are required for the purpose of raising water from the shaft. The mill will not resume operations before the rainy season sets in. Some twenty men will be put to work in a few days to retimber and otherwise repair the shaft, and everything will be placed in thorough order before the resumption of actual mining operations.

The original Amador mine, at Amsdor City, has shut down their mill entirely, owing to scarcity of water. All the miners have been discharged with the exception of six.

KEYSTONE MINE.—The new hoisting works at this mine are nearly completed, and the machinery is now being fitted in. The new shaft is down upward of 200 ft. It is the intention to sink it to 700 ft, and connect it with the lowest levels of the mine. The mill is working to its full capacity by steam power, and everything relating to the mine looks as prosperous as ever.

BUTTE.

A CHEAP CLEAN-UP.—Oroville *Mercury*, Oct. 9: On Friday night of last week, Henry White, who lives on the bluff, had his pile of auriferous dirt nicely washed, free of charge. It seems that he has been about three weeks at work, wheeling out a pile of dirt that he had every reason to think would pay well for washing, and so did a lot of Celestials, who had fastened their gaze upon it. No sooner had darkness come on than the Chinamen went to work and before morning had run every spadeful of earth through the sluice and taken the gold and gone to seek other and better paying claims, without thanking either Mr. White or Mr. Hewitt. Look out for your sluices.

CALAVERAS.

DITCH IMPROVEMENTS.—Calaveras *Chronicle*, Oct. 9: The canal company have been making extensive improvements on the line of the ditch in anticipation of the coming rains. A section of iron pipe, 42½ inches in diameter, has been put in place of the old aqnednot at Buckeye. The pipe is in the neighborhood of 500 ft in length. There is now scarcely any flume—certainly none that can blow down—from one end of the canal to the other. The ditch has lately been thoroughly cleaned, from its head to the Palomo school house, and the Central Hill
